## Revision History

<b>Publication Date</b>	<b>Summary</b>
November 2010	New version that supports Banner Student 8.5 software.

## Contents

<b>Chapter 1</b>	<b>System Overview</b>	
	Application Summary . . . . .	.1-3
	Functions and Features . . . . .	.1-4
	Chapter Organization . . . . .	.1-6
	Application Flow . . . . .	.1-8
	Flow Narrative . . . . .	.1-9
<b>Chapter 2</b>		
	Overall System Validation Forms Reference . . . . .	.2-3
	Validation Forms Cross Reference . . . . .	.2-7
	Required System Values for Validation Forms . . . . .	.2-9
	Validation Forms Menu System. . . . .	.2-58
	Validation Forms System Reference . . . . .	.2-61
<b>Chapter 3</b>	<b>Process Flows</b>	
	Banner Student System Overview Process Flow . . . . .	.3-5
	Communication Plan Process Flows. . . . .	.3-7
	Establish Communication Rules . . . . .	.3-7
	Establish Materials and Rules . . . . .	.3-8
	Assign Materials to Communication Plans . . . . .	.3-9

Processing Communication Plans Online. . . . .	.3-10
Processing Communication Plans in Batch. . . . .	.3-11
Building Communication Plans . . . . .	.3-12
<b>Test Score Restrictions and Prerequisites Process Flow . . . . .</b>	<b>.3-13</b>
Test Score Restrictions and Prerequisites Process Flow Narrative. . . . .	.3-15
<b>Block Scheduling Process Flow . . . . .</b>	<b>.3-16</b>
Block Scheduling Process Flow Narrative . . . . .	.3-17
<b>Schedule25 Process Flows . . . . .</b>	<b>.3-19</b>
Run Process Flow . . . . .	.3-19
Initial Setup of Schedule25 Data . . . . .	.3-20
<b>Electronic Prospects Tape Load Process Flow . . . . .</b>	<b>.3-21</b>
<b>Concurrent Curricula Process Flow . . . . .</b>	<b>.3-22</b>
<b>Loading Packages/Procedures from Temporary to Production Tables (SRKPREL) Process Flows . . . . .</b>	<b>.3-23</b>
Overview . . . . .	.3-23
Creating Person Data. . . . .	.3-24
Evaluating the Application . . . . .	.3-24
Inserting Recruiting Information. . . . .	.3-25
Updating Recruiting Information - Part 1 . . . . .	.3-26
Updating Recruiting Information - Part 2 . . . . .	.3-27
<b>Admissions Process Flow . . . . .</b>	<b>.3-28</b>
Admissions Process Flow Narrative . . . . .	.3-29
<b>External Tape Load Process Flow . . . . .</b>	<b>.3-30</b>
<b>Registration Process Flow . . . . .</b>	<b>.3-31</b>
Registration Process Flow Narrative . . . . .	.3-32
<b>Student Right to Know Process Flows. . . . .</b>	<b>.3-34</b>
Persistence Reporting Process Flow . . . . .	.3-34
Persistence/Sport Reporting Process Flow . . . . .	.3-35

Completion/Graduation Reporting Process Flow . . . . .	.3-36
Completion/Graduation/Sport Reporting Process Flow . . . . .	.3-37
<b>Fee Assessment Process Flows . . . . .</b>	<b>.3-38</b>
Rules Process Flow . . . . .	.3-38
Refunding Rules Process Flow . . . . .	.3-39
<b>Open Learning Registration Process Flows . . . . .</b>	<b>.3-40</b>
Section Set-up Process Flow . . . . .	.3-40
Data Process Flow . . . . .	.3-41
Overall Process Flow . . . . .	.3-42
Rules Use Process Flow . . . . .	.3-43
Rule Tables Process Flow . . . . .	.3-43
<b>Return of Title IV Funds Process Flow . . . . .</b>	<b>.3-44</b>
<b>Academic History Repeat Processing Flow . . . . .</b>	<b>.3-45</b>
Academic History Repeat Processing Flow Narrative . . . . .	.3-46
<b>Academic History End of Term Flow . . . . .</b>	<b>.3-48</b>
Academic History End of Term Flow Narrative . . . . .	.3-49
<b>Academic History Graduation Flow . . . . .</b>	<b>.3-51</b>
Academic History Graduation Flow Narrative . . . . .	.3-53
<b>Graduation Application Process Flow . . . . .</b>	<b>.3-57</b>
<b>Electronic Gradebook Process Flow . . . . .</b>	<b>.3-58</b>
<b>National Student Clearinghouse (NSC) Process Flows . . . . .</b>	<b>.3-59</b>
Establish Time Status Rules and NSC Equivalencies . . . . .	.3-59
Establish Term Control for Calculating Time Status and Academic History FICE Code Control . . . . .	.3-60
Calculate Time Status and Update/Insert Time Status History Records . . . . .	.3-61
Report to NSC (National Student Clearinghouse) . . . . .	.3-65
<b>XML Transcript Process Flow . . . . .</b>	<b>.3-66</b>

## Chapter 4 Catalog

<b>Catalog Procedures</b> . . . . .	<b>4-3</b>
Building or Changing a Course Catalog . . . . .	4-3
Course Contact Hours . . . . .	4-3
Open Learning Registration and Course Catalog. . . . .	4-3
Set Up New Course for Traditional and Open Learning Registration . . . . .	4-5
Update Existing Course for Open Learning Registration . . . . .	4-6
Creating a Continuing Education Catalog Entry . . . . .	4-6
Maintaining Faculty Workload. . . . .	4-7
Building Registration Restrictions on Courses . . . . .	4-7
Building Schedule Restrictions on Courses. . . . .	4-15
Mutually Exclusive Courses. . . . .	4-15
Repeat/Equivalent Course Rules . . . . .	4-21
Tuition Fee Waivers. . . . .	4-22
Banner Course Data Extract Capabilities . . . . .	4-22
Catalog Extract and Load Processing . . . . .	4-25
<b>Catalog Reports</b> . . . . .	<b>4-37</b>
Bulletin Report . . . . .(SCRBULT). . . . .	4-39
Course Catalog IMS Extract . . . . .(SCRIRMS). . . . .	4-45
Course Catalog Data Extract Process . . . . .(SCRDATE). . . . .	4-47

## Chapter 5 Class Schedule

<b>Class Schedule Procedures</b> . . . . .	<b>5-5</b>
Create Term Controls . . . . .	5-5
Creating Instructors . . . . .	5-5
Building Available Rooms. . . . .	5-6
Creating Campus Security . . . . .	5-6
Create Future Term Schedule . . . . .	5-6
Building/Changing Course Sections . . . . .	5-8
Meeting Time/Room Assignments . . . . .	5-8
Session Creation . . . . .	5-8
Duplicate Section Creation . . . . .	5-9
Create Duration Units. . . . .	5-13
Create Instructional Methods . . . . .	5-14

Open Learning and Class Schedule . . . . .	.5-14
Set up an Open Learning Section . . . . .	.5-15
Update an Existing Section to be an Open Learning Section. . . . .	.5-18
Set Up Non-Open Learning Section . . . . .	.5-19
Set Up Section Fee Assessment, Extension, and Refunding Rules for Open Learning Courses . . . . .	.5-20
Faculty Assignments . . . . .	.5-21
Maintaining Section Comments. . . . .	.5-21
Reviewing Course Sections. . . . .	.5-21
Reviewing Building/Room Schedule . . . . .	.5-22
Producing a Schedule of Classes. . . . .	.5-24
Reviewing Enrollment Counts. . . . .	.5-24
Schedule Contact Hours . . . . .	.5-24
Section Contact Hours . . . . .	.5-26
Section Weekly Contact Hours . . . . .	.5-27
Creating Cross List Definitions . . . . .	.5-27
Schedule Module Links . . . . .	.5-28
Create Section Contract Information . . . . .	.5-30
Creating/Modifying Restrictions on Sections . . . . .	.5-31
Course Fee Assessment Rules by Level . . . . .	.5-32
Tuition & Fee Analysis by Course. . . . .	.5-33
Tuition Fee Waivers. . . . .	.5-33
Reserved Seating. . . . .	.5-34
Maintain Academic Calendar . . . . .	.5-40
Maintain Attendance Accounting Method. . . . .	.5-42
Schedule Overrides. . . . .	.5-44
Block Scheduling . . . . .	.5-44
Auto Scheduling Processing . . . . .	.5-53
Purge Process . . . . .	.5-76
<b>Class Schedule Reports. . . . .</b>	<b>.5-76</b>
Term Roll Report . . . . .(SSRROLL). . . . .	.5-77
Class Schedule Report . . . . .(SSRSECT). . . . .	.5-90
Scheduled Section Tally Report . . . . .(SSRTALY) . . . . .	.5-95
Schedule Purge . . . . .(SSPSCHD) . . . . .	.5-101
Room Attribute Sequence Update Process . . . . .(SSRATSQ). . . . .	.5-106
Schedule25 Work File Creation Process . . . . .(SSRSCRM) . . . . .	.5-109

Scheduler Work Table Update Process . . . . .(SSRSCUP) . . . . .	5-112
Update Building/Room Process . . . . .(SSRSCMT) . . . . .	5-114
Scheduler Work Table Purge Process . . . . .(SSRSCPR) . . . . .	5-115
Section Fee Population Process . . . . .(SSPMFEE) . . . . .	5-116
Schedule Open Learning Rule Default Process . . . . .(SSPRDEF). . . . .	5-118
Available Seats to Zero Process . . . . .(SSRASTZ). . . . .	5-120

## Chapter 6 General Person

<b>General Person Procedures . . . . .</b>	<b>6-3</b>
Establish Person . . . . .	6-3
Common Matching Processing . . . . .	6-3
Maintaining Multiple Telephone Numbers. . . . .	6-28
Enter Biographic Information . . . . .	6-29
Maintain Comments. . . . .	6-29
Enter Emergency Contacts . . . . .	6-29
Enter Medical Information. . . . .	6-29
Maintain International Information . . . . .	6-29
Add/Remove Holds . . . . .	6-29
Schedule Appointments/Track Contacts . . . . .	6-30
Support Services Processing . . . . .	6-30
Produce List of Persons . . . . .	6-31
Purge Process . . . . .	6-31
Banner Student Interface to Banner Human Resources . . . . .	6-32
<b>General Person Reports. . . . .</b>	<b>6-32</b>
Creating a Population Selection . . . . .	6-32
Person Directory . . . . .(SPRPDIR) . . . . .	6-35
Support Services Load Process . . . . .(SERLOAD) . . . . .	6-40

## Chapter 7 Faculty Load

<b>Faculty Load Procedures . . . . .</b>	<b>7-3</b>
Faculty Workload Rules Creation . . . . .	7-3
Faculty Information . . . . .	7-5
Faculty Assignments . . . . .	7-6
Faculty Contract Analysis. . . . .	7-11

Multiple Contracts . . . . .	.7-11
Automatic PIN Creation . . . . .	.7-12
Automated Faculty Load and Compensation Processing. . . . .	.7-13
Faculty Security Menu and Term Availability . . . . .	.7-21
Faculty Security Process Rules. . . . .	.7-26
Purge Process . . . . .	.7-41
Banner Student Interface to Banner Human Resources . . . . .	.7-41
<b>Faculty Load Reports . . . . .</b>	<b>.7-42</b>
Instructor Schedule Report . . . . .(SIRASGQ) . . . . .	.7-43
Faculty Load Contract Analysis Report . . . . .(SIRCTAL) . . . . .	.7-46
Faculty Load Term Analysis Report . . . . .(SIRTRAL) . . . . .	.7-51
Instructional Assignment Purge . . . . .(SIPASGN) . . . . .	.7-55

## Chapter 8 Location Management

<b>Location Management Procedures. . . . .</b>	<b>.8-3</b>
Housing Room Assignment Using Building and Room Genders . . . . .	.8-3
Housing Module Deposits. . . . .	.8-4
Housing Module Assessment. . . . .	.8-5
Batch Scheduling of Housing Assignments. . . . .	.8-7
Assignment Roll Process . . . . .	.8-13
Housing Letter Generation and Population Selection. . . . .	.8-14
Purge Process . . . . .	.8-16
<b>Location Management Reports . . . . .</b>	<b>.8-16</b>
Creating a Population Selection . . . . .	.8-16
Dormitory Address Creation Report . . . . .(SLRDADD) . . . . .	.8-19
Active Housing Assignments Report . . . . .(SLRHLST) . . . . .	.8-21
Batch Room/Meal/Phone Assess Report . . . . .(SLRFASM). . . . .	.8-26
Assignment Roll Process . . . . .(SLRROLL). . . . .	.8-31
Batch Housing Schedules Report. . . . .(SLRSCHE). . . . .	.8-34
Batch Scheduler Report . . . . .(SLRSCHD) . . . . .	.8-35
Housing Purge . . . . .(SLPHOUS) . . . . .	.8-38
ACS Housing Interface . . . . .(SLRBACS). . . . .	.8-41

## Chapter 9 Recruiting

<b>Recruiting Procedures</b> . . . . .	<b>9-5</b>
Add/Maintain Prospects . . . . .	9-5
Add/Maintain Test Scores . . . . .	9-5
Add/Maintain High School Data . . . . .	9-6
Add/Maintain Prior College Data . . . . .	9-6
Review Prospects . . . . .	9-6
Assign/Review Recruiter's Appointments and Visits . . . . .	9-6
Establish Source, High School, or College . . . . .	9-6
Build Statistical Information for a Source or Background Institution . . . . .	9-6
Review Prospects and Visits by Source . . . . .	9-7
Produce System-Generated Letters . . . . .	9-7
Analyze Recruiting Enrollment . . . . .	9-7
Print/Delete Recruits Who Did Not Apply . . . . .	9-8
Appointment Scheduling . . . . .	9-8
Communication Plan Processing . . . . .	9-9
Electronic Prospects Processing . . . . .	9-23
Tape Load and Match Processing . . . . .	9-44
Search and Test Score Tape Load . . . . .	9-55
<b>Recruiting Reports</b> . . . . .	<b>9-134</b>
Rec/Enroll Analysis - How Learned Report . . . . . (SRREN RH) . . . . .	9-135
Recr/ Enrl Analysis - Source/Recr Report . . . . . (SRREN RL) . . . . .	9-138
Recruits Never Applied to Inst. Report . . . . . (SRRIN QR) . . . . .	9-140
Communication Plan Processing Report . . . . . (SORCPLN) . . . . .	9-143
Electronic Prospect Load . . . . . (SRTLOAD) . . . . .	9-145
Electronic Prospect Purge . . . . . (SRTPURG) . . . . .	9-186
Electronic Prospect Match . . . . . (SRRSRIN) . . . . .	9-189
Migrate Electronic Prospects Process . . . . . (SRRPREL) . . . . .	9-200
Electronic Prospect Email Process . . . . . (SRREMAIL) . . . . .	9-204

## Chapter 10 Admissions

<b>Admissions Procedures</b> . . . . .	<b>10-7</b>
Build Admission Credentials . . . . .	10-7
Build Automated Decision Rules . . . . .	10-8

Review Decision Rules . . . . .	10-14
Create Application . . . . .	10-14
Application Preference Number. . . . .	10-15
Enter/Calculate Decision on Applicant . . . . .	10-15
Multiple Applicant Acceptance Decisions. . . . .	10-15
Add/Maintain Test Scores. . . . .	10-18
Add/Maintain High School Data. . . . .	10-19
Add/Maintain Prior College Data . . . . .	10-19
Maintain Guardian Information . . . . .	10-19
Add Student Through Quick Entry . . . . .	10-19
Review Application Data . . . . .	10-20
Letter Generation—Letters, Paragraphs, and Variables . . . . .	10-20
Build Curriculum Definition . . . . .	10-26
Concurrent Curricula Processing . . . . .	10-26
Mass Entry Processing . . . . .	10-27
Study Path Processing . . . . .	10-27
Duplicating An Admissions Application . . . . .	10-27
Admissions Application Set-Up Procedures for Banner Self-Service. . . . .	10-28
Procedures Used in Self-Service Admissions Processing . . . . .	10-47
Routines Used in Self-Service Admissions Processing. . . . .	10-48
Rule Groups Used in Self-Service Admissions Processing. . . . .	10-55
Delivered Rule Groups Used in Self-Service Admissions Processing . . . . .	10-56
Cross-Reference Labels Used in Self-Service Admissions Processing . . . . .	10-67
Processing Self-Service Admissions Applications . . . . .	10-74
Manually Matching, Verifying, and Pushing Electronic Applications . . . . .	10-79
Quick Start Set-Up Procedures for Banner Student Self-Service. . . . .	10-86
Using Accept Admissions Offer in Self-Service. . . . .	10-93
Admissions and Curriculum Processing in Banner Self-Service . . . . .	10-98
Setting Up Curriculum Processing for Self-Service Applications . . . . .	10-101
TS 189 Upload (SAR189U) of Electronic Applications . . . . .	10-105
EDI Set-Up Procedures. . . . .	10-106
Procedures Used in EDI Processing . . . . .	10-116
Routines Used in EDI Processing . . . . .	10-118
Rule Groups Used in EDI Processing. . . . .	10-125
Delivered Rule Groups Used in EDI Processing . . . . .	10-126
Cross-Reference Labels Used in EDI Processing . . . . .	10-138
Receiving EDI Applications (to Temporary Tables) . . . . .	10-143

Processing EDI Applications . . . . .	10-144
Manually Matching, Verifying, and Pushing Electronic Applications . . . . .	10-149
Race/Ethnicity Processing . . . . .	10-153
AMCAS (American Medical College Application Service) Load Procedures Using SRTLOAD . . . . .	10-159
AMCAS Admissions Action File Creation . . . . .	10-194
Selective Admissions - Communication Load and Removal . . . . .	10-205
Selective Admissions - Secondary School Tracking . . . . .	10-207
Selective Admissions - Admissions Rating/Batch Entry . . . . .	10-211
Tape Load and Match Processing . . . . .	10-213
Selective Admissions - Search and Test Score Tape Load . . . . .	10-213
Selective Admissions - Regionalization . . . . .	10-214
Selective Admissions - Process Geographic Regions, Administrators, and Ratings . . . . .	10-219
Purge Process . . . . .	10-223
<b>Admissions Reports . . . . .</b>	<b>10-223</b>
Creating a Population Selection . . . . .	10-224
Admissions Count by College/Major Report . . . . . (SARACTM) . . . . .	10-227
Admissions Application Report . . . . . (SARADMS) . . . . .	10-230
Admit Decision Calculation Report . . . . . (SARBDSN) . . . . .	10-239
Admission Decision Criteria Report . . . . . (SARDCSN) . . . . .	10-243
Admissions High School Report . . . . . (SORHSRP) . . . . .	10-247
Admission Purge . . . . . (SAPADMS) . . . . .	10-253
Appointment Purge Process . . . . . (SOPAPPT) . . . . .	10-255
SAT Recentering Process . . . . . (SOPSATS) . . . . .	10-258
AMCAS Extract File . . . . . (SARAMXF) . . . . .	10-260
AMCAS Date Purge . . . . . (SARAMDP) . . . . .	10-262
Communication Load Process . . . . . (SURLOAD) . . . . .	10-263
Communication Removal Process . . . . . (SURDEL) . . . . .	10-266
Source/Background Summary Report . . . . . (SORSBSM) . . . . .	10-269
Prior College Summary Report . . . . . (SORPCSM) . . . . .	10-273
Rating Audit Report . . . . . (SARDCBT) . . . . .	10-275
Administrator Assignments Process . . . . . (SORAINF) . . . . .	10-279
Electronic App Purge Process . . . . . (SARETPG) . . . . .	10-282
Elec App Verify/Load Process . . . . . (SARETMT) . . . . .	10-284
TS 189 Upload to Banner . . . . . (SAR189U) . . . . .	10-289
Student Email Process . . . . . (SOREMAL) . . . . .	10-290

Batch Email for Elec. Apps. Process . . . . .	(SAREMAL)	. . . . .	10-297
Admission Rating Calculation Report . . . . .	(SARRATE)	. . . . .	10-301
Electronic Application Report . . . . .	(SARETBL)	. . . . .	10-305
Learner Curriculum Conversion Process . . . . .	(SOPLCCV)	. . . . .	10-313
Learner Curriculum Purge Process . . . . .	(SOPLCPG)	. . . . .	10-316
Non-Destructive Curric Update Report . . . . .	(SORLCHG)	. . . . .	10-322
Process Mass Entry Report . . . . .	(SORMEBP)	. . . . .	10-333
Purge Mass Entry Audit Process . . . . .	(SOPMAUD)	. . . . .	10-336

## Chapter 11 General Student

<b>General Student Procedures . . . . .</b>			<b>11-3</b>
Review/Change Current Student Information . . . . .			11-3
Concurrent Curricula Processing . . . . .			11-4
Mass Entry Processing . . . . .			11-4
Study Path Processing . . . . .			11-4
Athletic Compliance Processing . . . . .			11-5
Student Right to Know Reporting . . . . .			11-23
Assign Cooperative Education Program . . . . .			11-33
Assign Education Opportunity Programs and Services . . . . .			11-33
Establish Student Classification . . . . .			11-33
Class Standing . . . . .			11-33
Add/Maintain Test Scores . . . . .			11-34
Add/Maintain High School Data . . . . .			11-34
Add/Maintain Prior College Data . . . . .			11-35
Review Student Data . . . . .			11-35
Review Veterans Data . . . . .			11-35
Cooperative Education (Co-op) Tracking . . . . .			11-36
Automatic PIN Creation . . . . .			11-39
Purge Processes . . . . .			11-40
<b>General Student Reports . . . . .</b>			<b>11-40</b>
Creating a Population Selection . . . . .			11-41
Student Report . . . . .	(SGRSTDN)	. . . . .	11-43
Veteran Report . . . . .	(SGRVETN)	. . . . .	11-48
Hold Purge . . . . .	(SGPHOLD)	. . . . .	11-54
General Student Purge . . . . .	(SGPSTDN)	. . . . .	11-57

Cooperative Education Purge . . . . .	(SGPCOOP) . . . . .	11-61
Student Block Load Process . . . . .	(SGPBLCK). . . . .	11-64
Cohort Load Process . . . . .	(SGRCHRT) . . . . .	11-66
Student Right to Know Report . . . . .	(SGRKNOW) . . . . .	11-69

## Chapter 12 Registration

<b>Registration Procedures . . . . .</b>	<b>12-9</b>
Registration Tables to be Updated Each Semester. . . . .	12-9
Concurrent Curricula Processing . . . . .	12-10
Mass Entry Processing . . . . .	12-10
Study Path Processing . . . . .	12-10
Mainline Edit Registration. . . . .	12-11
Registration Error Messages . . . . .	12-15
Enrollment Count Scripts . . . . .	12-19
Create Term Controls . . . . .	12-20
Set Up Registration Hours . . . . .	12-20
Define Registration Statuses for Student and Course . . . . .	12-22
Student Registration Status and Course Registration Status . . . . .	12-23
Student Levels Versus Course Levels in Registration . . . . .	12-25
Registration Course Error Flags . . . . .	12-25
Build Tuition and Fees . . . . .	12-26
Assess Additional Fees . . . . .	12-27
Assess Tuition and Fees . . . . .	12-28
Registration Fee Assessment Processing . . . . .	12-28
Registration Fee Assessment and Open Learning Courses . . . . .	12-97
Registration Fee Assessment and Study Paths . . . . .	12-107
Registration Fee Assessment Combined Fee Assessment Process . . . . .	12-108
Register Students . . . . .	12-111
Open Learning Registration. . . . .	12-112
Enrollment Verification Processing . . . . .	12-123
Schedule/Invoice/Statement Options . . . . .	12-130
Produce Student's Schedule . . . . .	12-135
Unsatisfied Links . . . . .	12-135
Produce Student's Bill. . . . .	12-135
View Student's Registration. . . . .	12-135
Produce Course Request Edit . . . . .	12-136

Produce Course Request Update. . . . .	12-136
Produce Class Roster. . . . .	12-136
Produce Headcount. . . . .	12-136
View Class Roster/Enter Grades . . . . .	12-136
Last Date of Attendance . . . . .	12-137
Handle Student's Registered, Not Paid . . . . .	12-137
Process Canceled Classes . . . . .	12-138
Waitlisting . . . . .	12-138
Automated Waitlisting. . . . .	12-140
Drop Last Class. . . . .	12-164
Drop/Withdrawal Processing for Connected Courses . . . . .	12-165
Rules and Use of the Term Control Form (SOATERM) in Repeat Processing . . . . .	12-176
National Student Clearinghouse (NSC) Reporting Procedures. . . . .	12-179
National Student Loan Data System (NSLDS) Student Status Confirmation Report (SSCR) Roster File Procedures. . . . .	12-209
Registration Set-Up Procedures for Banner Student Self-Service . . . . .	12-223

## Chapter 1 System Overview

Application Summary . . . . .	1-3
Functions and Features . . . . .	1-4
Chapter Organization . . . . .	1-6
Application Flow . . . . .	1-8
Flow Narrative . . . . .	1-9

## Application Summary

---

SunGard® Higher Education's software products support the integrated flow of information throughout your institution to assist you in resource management. The Banner® Series continues this tradition with the Banner Student System and its diverse and interrelated applications.

A flexible, comprehensive solution to the problems of student administration, the Banner Student System sets a new standard for scheduling, registration, accounts receivable, academic history and other functions in higher education. It delivers the information you need to better control your administrative costs, which typically represent the largest single expenditure in your budget.

Banner Student supports the full range of functions necessary for student administration, including: creation of catalogs; data collection for scheduling of classes, admissions, assignment of housing, faculty workload analysis, and registration; all accounts receivable; and academic history and degree audit reporting.

The Banner Student System benefits many of your administrative offices. To further maximize its data availability, the Banner Student System can be fully integrated with the Banner Finance, Banner Human Resources, Banner Advancement, and Banner Financial Aid systems. It is also available as a comprehensive stand-alone system.

Banner places your institution at the forefront of student information technology through its use of Oracle®--the relational database management system from Oracle Corporation--and SQL, the standard for database access. By combining sophisticated technology with an architecture based on user-defined rules, Banner creates an information environment you can tailor to meet your unique requirements--without extensive technical support.

To accommodate the individual needs and preferences of your institution, SunGard Higher Education delivers Banner in a variety of hardware environments, including AT&T, Data General, Digital, Hewlett-Packard, IBM, NCR, Sequent, and SUN. This flexibility enables you to use your Banner Student System with the hardware package that is right for you.

# Functions and Features

---

The Banner Student System is made up of many interactive functions. These functions are organized into fourteen modules:

- *Course Catalog* enables you to define courses to be entered in the institution's catalog. This involves compiling of data such as course title, department, credit hours, corequisites or prerequisites, fee information, and restrictions for the course. Start and end terms for each course are maintained, along with text to be printed on the course bulletin.
- *Class Schedule* contains the data necessary to build and print a schedule of classes, including term attributes (dates for each session within a term), and establishing a Course Reference Number. In addition, instructors are assigned to classes, classes are scheduled into rooms depending on the attributes needed and available, and course sections with user defined comments are established. The Schedule module also provides a means of "rolling" the schedule forward to the next applicable term to decrease the data entry process. Block scheduling is maintained in this module.
- *General Person* supplies the means to identify both persons and non-persons, such as third-party accounts, in the system. Identification number, name, address, and, where applicable, biographic information are gathered and maintained. Emergency contact, medical, and international student information are also collected for use in other modules. Support Services such as goals, needs, and services can also be maintained.
- *Faculty Load* enables you to enter and maintain information including instructional and non-instructional assignments for a faculty member or advisor. Personnel information, such as tenure status and sabbatical dates, is maintained in this module along with workload and contract information.
- *Location Management and Housing* allows for the definition of the institution's buildings and room facilities. In addition, the Location Management and Housing module provides a means of assigning rooms for special events, and provides a listing of available rooms with attributes. Dormitory, meal plan, and phone assignments, as well as assessments, may also be maintained in this module.
- *Recruiting* maintains information about potential recruits such as: source, intended majors, test scores, high school and prior college information, and outside interests. It builds statistical information about sources and a plan for producing materials, and allows for creation of materials to be sent to prospects.
- *Admissions* establishes admission records and identifies items an applicant needs to provide to continue application processing. It calculates whether an applicant can be automatically admitted to the institution based on user defined rules. General Student records are automatically created once an applicant has accepted and plans to attend. Test scores, high school, and prior college information are maintained here, along with guardian information. The Admissions module also provides the means to allow quick entry for automatic registration eligibility.

- *General Student* modifies current information for students such as changes to major, residency, and student type. It also provides a place for entering information on career choice, including advisor, activities, and veteran information. Student classification and cooperative information, as well as Student Right to Know information, is maintained here.
- *Registration* allows for creation of enrollment information for a specific term. It defines rules determining student and course statuses, and controlling actions to be taken at registration, such as amounts of allowable refunds. Tuition and fees policy is built in Registration, along with rules to be used for the fee assessment algorithm. Student schedules and bills are produced, and class rosters are maintained. It also allows for sections to be graded and rolled into academic history.
- *Accounts Receivable* establishes accounts receivable controls: detail codes identifying charges or payments; default values, methods of payment, and how credits are handled; and messages to print on bills. The Accounts Receivable module displays term specific tuition, housing, meal plan, and fee charges, and calculates exemptions and contracts for eligible students. Along with maintaining account information for non-student accounts, payments are entered here and accounts can be reviewed and updated. This module allows for establishing installment plans for accounts and third-party contracts. Billing and invoicing are controlled from this module, along with collection agency assignments. Reports can be generated detailing activity of cashiers, unpaid charges for accounts, and account transactions.

 **Note**

This module is contained in a separate manual called the *Banner Accounts Receivable User Guide*. ■

- *Academic History* enables you to build grading policies and maintain grades. Grades are rolled to Academic History, and the system automatically checks for repeat courses. Academic standing is calculated using user-defined rules regarding probation and Dean's List policies. Grade mailers are produced in this module and term GPA information is maintained here. Degrees and honors associated with each student are entered in this module, along with information on majors, minors, and status. Transfer course work is recorded in the Academic History module, and an automatic transfer articulation process is available. The transcripts are also printed from here. Graduation information, including diploma, ceremony, ceremony attendance, and graduation dress, is maintained here.
- *Curriculum, Advising and Program Planning (CAPP)* builds degree program codes establishing appropriate majors, minors, and concentrations for degree programs. All requirements, both general (i.e., minimum GPA, minimum hours) and course specific (i.e., humanity or social science requirement), are built in this module. Automatic assignment of a degree program code occurs if a student meets all the requirements for an established degree program. Non-course requirements are

approved in this module. This module is also used to assign courses to multiple requirements, and execute compliance verification.

 **Note**

This module is contained in a separate manual called the *CAPP (Curriculum, Advising and Program Planing) Handbook*. ■

- *Banner Student System Management* is used for tape load processing and rule creation, as well as for person and non-person system searches. The processing and use of Value-Based Security using Fine Grained Access Control are discussed here.

These modules can be tailored to your institution using the Banner Student System's *rule-based architecture*, which permits you to define your own calculation parameters and processing rules.

## Chapter Organization

---

The chapters in the *Banner Student User Guide* are organized as follows:

Chapter 1 contains a broad survey of the Banner Student System and introduces you to its key features. The following is a list of the sections in this chapter and a brief description of the information you can find in each section.

- The “Application Summary” provides a description of the application and the problems it resolves. It also describes the application's place in the Banner System and identifies database and hardware environments.
- The “Functions and Features” section describes the key functions and notable features of the Banner Student application.
- The “Application Flow” provides a flowchart that explains the interaction of Banner Student functions and modules.

Chapter 2 contains reference information on Banner Student System validation forms. The following is a list of the sections in this chapter and a brief description of the information you can find in each section.

- The “Overall System Validation Forms Reference” section provides a listing of the system validation forms used by the overall (SO%) Banner Student System forms.
- The “Validation Forms Cross Reference” section provides a listing of Banner Student System validation forms which are referenced by other Banner Student System validation forms.
- The “Required System Values” section provides a listing of values which are required by the Banner Student System for the various validation forms.

- The “Validation Forms Cross-Reference” section provides an alphabetical listing of all Banner Student System validation forms and the application forms associated with them by corresponding module order.

Chapter 3 contains the process flows for the Banner Student System.

- The “Process Flows” provide flowcharts that explain the processes of the Banner Student functions.
- The “Flow Narratives” provide text to further explain the processes.

Chapters 4 through 14 each explain one of the modules of the Banner Student System. The following is a list of the sections in each chapter and a brief description of the information you can find in each section.

- “Procedures” contains instructions for performing the various tasks involved in creating procedures used by that module.
- “Reports” provides a sample of each report, with parameter descriptions, generated by that module.

Chapter 15 contains the information on the California FTES Reports for the Banner Student System. This chapter contains only a reports section.

Chapter 16 contains the information on the interfaces between the Banner Student System and the Banner Finance, Banner Financial Aid, Banner Advancement, and Banner Human Resources Systems.

Appendix A contains a complete listing and brief description of all C, COBOL, Java, and Oracle reports used in the Banner Student System.

Appendix B contains information on EDI codes, flat files, processing, and reporting using EDI.Smart with Banner Student.

Appendix C contains information on using and storing multiple curriculum records for a person as they move through the student cycle (Recruiting, Admissions, General Student, Registration, and Academic History).

Appendix D contains information on using mass entry processing with Admissions, General Student, Registration, and Academic History (graduation).

Appendix E contains information on using study paths with Admissions, General Student, Registration, and Academic History.

## Flow Narrative

1. The Course Catalog module defines the courses offered by your institution.
2. Information about the courses is transferred to the Schedule module, where it is used to build the schedule of classes. In turn, Schedule passes information on to Registration to create class rosters, to Location Management for room scheduling, and to Faculty Load for faculty workload analysis.
3. The General Person module is used to collect identification and demographic data about persons and non-persons. The person information is used in the Faculty Load, Admissions, and Recruiting modules.
  - 3.1. The Support Services module receives information from the General Person module to create goals and needs, and to monitor services which the person may have received.
4. The Faculty Load module is used to maintain instructional and non-instructional information pertaining to faculty members and advisors on a term and contract basis. Information from the General Person module must be created first and is passed into the Faculty Load module. Once the faculty members are established, and instructional assignments are created, the information is passed to the Schedule module and may be used in Academic History when creating committees, as well as in the General Student module in conjunction with assistantship data.
5. The General Person information is also passed to Recruiting, which collects and maintains information about potential recruits, such as sources, test scores, and high school and prior college information. Information regarding intended degree, major, department, etc., may be passed to the Admissions module when creating application records.
6. Data from General Person is also passed to Admissions, creating applicant records. Admissions, after establishing admission records, then passes the applicant data to General Student and Academic History as applicable. Admissions also allows for Quick Entry for eligible students.
7. The General Student module provides a place for changing established data for students, such as changes in curriculum or residency. This information can be updated by Registration and Academic History.
8. After rooms are defined in Location Management, information from the Schedule and General Person modules is used to build room assignments. Location Management, in turn, passes information back to Schedule. Location Management also sends data to the Accounts Receivable module regarding room, meal, and phone assessments.
9. The Registration module interfaces with the Schedule and General Student modules to create attributes for terms, and maintain class rosters. This information is then passed to the Academic History module to update the student's academic records.

**10.** Data from the General Person, Location Management, and Registration modules is fed into the Accounts Receivable module. Accounts Receivable not only displays charges for housing, meals, and fees, but also establishes installment plans for third party contracts.

**11.** Academic History, as noted, is updated by General Person, Admissions, and Registration, and in turn updates Degree Audit. Grade mailers are produced in this module.

Transfer Articulation is available from the Academic History information. Information pertaining to courses from outside institutions and the rules associated with their acceptance are defined in this module.

**12.** Curriculum, Advising and Program Planning is updated by Registration and Academic History, and is used to create degree program codes and build requirements.

## Chapter 2 Validation Reference

Overall System Validation Forms Reference . . . . .	.2-3
Validation Forms Cross Reference . . . . .	.2-7
Required System Values for Validation Forms . . . . .	.2-9
Validation Forms Menu System. . . . .	.2-58
Validation Forms System Reference . . . . .	.2-61

## Overall System Validation Forms Reference

This list references the system validation forms which are used by cross-modular Banner® Student System functional/application forms. These cross-modular forms are designated by the “O” for “overall system use” as the second letter of the form identifier.

Validation Form		Application/Functional Form	
STVACPR	Acceptance Practice Code Validation Form	SOABGTA	Transfer Articulation Institution Form
STVACST	Institutional Accreditation Status Validation Form	SOABGTA	Transfer Articulation Institution Form
STVADMR	Admission Request Checklist Code Validation Form	SOAHSCH	High School Information Form
		SOAPCOL	Prior College Form
		SOATEST	Test Information Form
		SOISBGI	Source/Background Institution Query-Only Form
STVADMT	Admission Type Code Validation Form	SOAIDNS	Person Search Detail Form
STVATYP	Address Type Code Validation Form	SOAFOLK	Guardian Information Form
		SOAIDNS	Person Search Detail Form
		SOADDRQ	Address Summary Form
STVBCHR	Background Inst. Characteristic Code Validation Form	SOABGIY	Source/Background Institution Year Form
STVCALD	Calendar Type Code Validation Form	SOABGTA	Transfer Articulation Institution Form
SVTCAMP	Campus Code Validation Form	SOACURR	Curriculum Rules Form
		SOAPROF	Campus Code Validation Form

Validation Form		Application/Functional Form	
STVCNTY	County Code Validation Form	SOAFOLK	Guardian Information Form
		SOAHSCH	High School Information Form
		SOAPCOL	Prior College Form
		SOASBGI	Source or Background Institution Base Form
		SOTCNVT	Tape Code Conversion Form
STVCOLL	College Code Validation Form	SOACURR	Curriculum Rules Form

## Validation Forms Cross Reference

This list indicates which validation forms validate against other validation forms.

Validation Form		Validates Against Validation Forms	
STVACTC	Banner Student Activity Code Validation Form	STVACCG	Activity Category Validation Form
		STVACTP	Activity Type Validation Form
STVATYP	Address Type Code Validation Form	STVTELE	Telephone Type Validation Form
STVCHRT	Cohort Code Validation Form	STVDLEV	Degree Level Code Validation Form
		STVTERM	Term Code Validation Form

Validation Form		Validates Against Validation Forms	
STVCSTS	Curriculum Status Validation Form	STVAPDC	Admission Application Decision Code Validation Form
		STVDEGS	Degree Status Code Validation Form
		STVSTST	Student Status Code Validation Form
STVDEGC	Degree Code Validation Form	STVACAT	Degree Award Category Code Validation Form
		STVDLEV	Degree Level Code Validation Form
STVEMPL	Employer Code Validation Form	GTVZIPC	ZIP/Postal Code Validation Form
		STVNATN	Nation Code Validation Form
		STVSTAT	State Code Validation Form
STVETHN	Ethnic Code Validation Form	STVACYR	Academic Year Validation Form
		STVETCT	IPEDS Ethnic Code Validation Form
STVINFC	Interface Validation Form	STVCTYP	Contact Type Code Validation Form
		STVSBGI	Source/Background Institution Code Validation Form
		STVTSRC	Admissions Test Score Source Code Validation Form
STVMAJR	Major, Minor, Concentration Code Validation Form	STVCIPC	CIP Code Validation Form
STVSBGI	Source/Background Institution Code Validation Form	STVADMR	Admissions Checklist Code Validation Form
STVSCHD	Schedule Type Code Validation Form	GTVINSM	Instructional Method Validation Form
STVSITE	Site Code Validation Form	GTVZIPC	ZIP/Postal Code Validation Form
		STVNATN	Nation Code Validation Form
		STVSTAT	State Code Validation Form
STVSTAT	State Code Validation Form	STVSITE	Site Code Validation Form
STVTERM	Term Code Validation Form	STVACYR	Academic Year Validation Form
STVTESC	Test Code Validation Form	STVADMR	Admissions Checklist Code Validation Form

Validation Form		Validates Against Validation Forms	
STVTRMT	Term Type Validation Form	STVTERM	Term Code Validation Form
STVVVYP	Visa Type Code Validation Form	STVADMR	Admissions Checklist Code Validation Form
STVWAPP	Application Type Code Validation Form	STVADMT	Admission Type Code Validation Form
		STVLEVL	Level Code Validation Form
		STVSTYP	Student Type Code Validation Form
STVWLTT	Web Application Customized Letter Type Validation Form	STVELMT	HTML Letter Module Validation Form

## Required System Values for Validation Forms

System-required data rows in Banner Student are listed below. The list is organized alphabetically by table name. Some Banner General tables are listed first, as the values shown are used in Banner Student processing.

### **GTVLFST**      **Learner Field of Study Type Validation Form**

MAJOR	Major
MINOR	Minor
CONCENTRATION	Concentration

### **GTVMVYP**      **Meeting Type Validation Form**

CLAS	Classroom
------	-----------

### **GTVPRNT**      **Printer Validation Form**

SHRPESE_PRNT	Printer setup for SHRPESE	Command - Not used but required for sleep/wake
SHRPESI_PRNT	Printer setup for SHRPESI	Command - Not used but required for sleep/wake

## GTVPROC

### Process Name Validation Form

WEBCCAPPDEP	Web Credit Card Application Deposit Process
WEBCCAPPFEEES	Web Credit Card Application Fees Process
WEBCCENROLLDEP	Web Credit Card Enrollment Deposit
WEBCCEPRTREQ	Web Credit Card Enrollment Verification Charge
WEBCCGRADAPP	Web Credit Card Graduation Application Process
WEBCCREGFEEES	Web Credit Card Registration Fees Process
WEBCCTRANSREQ	Web Credit Card Request Process

## GTVSCHS

### Scheduling Status Code Validation Form

NSM	Class needs a room assignment.
ISM	Class needs a room assignment and has a preferred first choice room indicated in the <b>Room Name</b> field. This code limits the initial pool of candidate rooms in the assignment algorithm.
WSM	Class needs a room assignment and must be assigned with the preceding NSM or ISM record to the same room at the same time (cross-listed).
RSM	Class is related to the preceding NSM or ISM record and must be assigned to the same room but not at the same days/time.
NXM	Class needs a room assignment and can share a room with another class whose times overlap with it (can be double-booked).
1XM	Class needs a room assignment, has a preferred first choice room indicated in the <b>Room Name</b> field, and can share a room with another class whose times overlap with it (can be double-booked).
RXM	Class is related to the previous NXM or 1XM record and must be assigned to the same room at the same or overlapping times.
ASM	Class has a room assignment that was made manually or in another system, such as the student information system.
AXM	Class has a room assignment that was made manually or in another system, and the class time span overlaps part of all of the time span of another class assigned to the same room (double-booking or intentional conflict).
HSM	This is a set of home cross-listed classes pre-assigned to the same room at identical days and times.

**GTVSCHS****Scheduling Status Code Validation Form**

- VSM This is a set of visitor cross-listed classes pre-assigned to the same room at identical days and times.
- 5SM Schedule25 assigned the class a room during a previous run.
- 5XM Schedule25 assigned the class a room, and it is double-booked with another class.

**STVACAT****Degree Award Category Code Validation Form**

- 11 Elementary School Program
- 12 Junior High School Program
- 13 High School Program
- 21 Post Secondary Certificate/Diploma < one year
- 22 Post Secondary Certificate/Diploma > one year and < two years
- 23 Associate's Degree
- 24 Baccalaureate Degree (Bachelor's)
- 25 Post Secondary Certificate/Diploma > two years and < four years
- 41 Post-Baccalaureate Certificate (Graduate)
- 42 Master's Degree
- 43, 32 Post-Masters's Certificate (Intermediate Graduate)
- 44 Doctoral Degree - Research/Scholarship
- 45, 31 Doctoral Degree - Professional Practice
- 46 Doctoral Degree - Other

**STVACTP****Activity Type Validation Form**

- SPRTS Sports

**STVACYR****Academic Year Validation Form**

- 0000 Beginning of Time
- 9999 End of Time

**STVADDA****Administrator Assignment Data Element Validation Form**

Base Table	Data Element	Description	Validation Table
GORPGEO	GORPGEO_GEOD_CODE	Person Geod Code	STVGEOD
GORPGEO	GORPGEO_GEOG_CODE	Person Geor Code	STVGEOR

**STVAPLS EDI Application Source Code Validation Form**

EDI Electronic Data Interchange  
WEB World Wide Web

**STVAPST Admissions Application Status Code Validation Form**

C Complete/Ready for Review  
D Decision Made  
I Incomplete/Items Outstanding

**STVASTD Academic Standing Code Validation Form**

00 Good Standing

**STVATYP Address Type Code Validation Form**

MA Mailing  
MA is required for tape load processing and is used by the Banner Advancement System for Banner Student loading processes.

PA Parents  
PA is from the original system-required values used on SOAFOLK when entering a parent address.

BI Billing  
BU Business  
BI and BU are required for sample data purposes if the Banner Finance System is installed.

**STVATYP**            **Address Type Code Validation Form**  
XX        Accounts Payable  
          XX is reserved for use by TGRFEED.

**STVCACT**           **Curriculum Activity Status Validation Form**  
ACTIVE        Active Curriculum  
INACTIVE     Inactive Curriculum  
REMOVED     Removed

 **Note**

Please note that STVCACT does not contain a system-required indicator. The indicator resides in the Curriculum Activity Status Rules Table (SOBCACT). The specified values must exist in the table when using curriculum processing. ■

**STVCAST**           **Combined Academic Standing Code Validation Form**  
00        Good Standing

**STVCKSR**           **Application Checklist Source Validation Form**  
BASELINE     Originates from Banner

**STVCOLL**           **College Code Validation Form**  
00        No College Designated  
99        College Used in Statistical Calculation

**STVCSTS****Curriculum Status Validation Form**

ADMITREPLACE	Application replaces learner
APPACCEPT	Applicant Acceptance
APPLIED	Application Exists
AWARDED	Degree Awarded
CHANGED	Changed
COMPLETED	Completed
DENIED	Application has been rejected
INPROGRESS	In Progress
INSTACCEPT	Institution Acceptance
NOPUSH	Self-Service No Push to Learner
OVERLOAD	Overload
PENDING	Pending
REMOVED	Inactivate field of study
SOUGHT	Degree has sought status
STUDYPATH	Study Path Created

 **Note**

Please note that STVCSTS shares these required values with the Curriculum Status Events Table (SORCSTS). The specified values must exist in the SORCSTS table when using curriculum status events and user-preferred translations for the value of the curriculum status code on STVCSTS. ■

**STVDAYS****Days of the Week Validation Form**

U	Sunday
M	Monday
T	Tuesday
W	Wednesday
R	Thursday
F	Friday
S	Saturday

**STVDEGC****Degree Code Validation Form**

000000	Degree Not Declared
--------	---------------------

**STVDEGS****Degree Status Code Validation Form**

SO	Sought
----	--------

<b>STVDEPT</b>	<b>Department Code Validation Form</b>
0000	Department Not Declared
<b>STVDFLT</b>	<b>Compliance Defaults Option Validation Form</b>
ONLINE	Online processing default
BATCH	Batch processing default
WEB	Web processing default
<b>STVEAPL</b>	<b>Electronic Application Status Validation Form</b>
H	Admissions Hold
I	Can't Insert Decision Code
R	Match Error
N	Not Processed
Y	Process Complete
P	Push Error
U	Suspended Record
V	Verification Error
<b>STVEDIS</b>	<b>EDI Status Code Validation Form</b>
P0	XML Request Received
P1	XML Transcript Exported
P2	XML Export had errors
P4	XML Export held for final grades
P5	XML Export held for awarded degree
<b>STVEGRP</b>	<b>EDI Rule Group Validation Form</b>
ACHR	AMCAS Course Summaries
ADDR	Address Source Rules
ADMS	Admission Rules
AGPA	AMCAS GPA Types
ATST	AMCAS Test Codes
ATYP	Address Type Rules
CHKL	Checklist Rules
CQLF	Code Qualifiers
CURR	Curriculum Rules
DCSN	Applicant Decision
DISP	Web Display Rules
DTQL	Date/Time Qualifier Rules

**STVEGRP****EDI Rule Group Validation Form**

ENTY	Entity Rules
FLVL	Field of Study Level Rules
LGCY	Legacy Rules
PATH	System Path Rules
PCOL	Prior College Rules
PQLF	Phone Qualifier Code Rules
PREL	Electronic Prospect Group
QSTN	Question Code Rules
RESD	Residency Rules
RFQL	Reference Qualifier Rules
RLTN	Relationship Qualifier Rules
TELE	Telephone Patern Rules
VCRL	Verification Control Rules

**STVELMT****HTML Letter Module Validation Form**

<b>Module</b>	<b>Description</b>	<b>View</b>
A	Admissions	AS_ADMISSIONS_APPLICANT
E	Electronic App	SAVEAPS
F	Registration	AS_STUDENT_REGISTRATION_DETAIL
P	Electronic Prospect	SRVPREL
R	Recruit	AS_RECRUITING_DATA
S	Student	AS_STUDENT_DATA
T	Transcripts	SHVTRE1

**STVESTS****Student Registration Status Code Validation Form**

EL	Eligible to Register
----	----------------------

**STVETCT****IPEDS Ethnic Code Validation Form**

1	Black Non-Hispanic
2	American Indian or Alaskan Native
3	Asian or Pacific Islander
4	Hispanic
5	White Non-Hispanic
6	Other

**STVEVEN****Academic History Event Code Validation Form**

999	Miscellaneous Event
-----	---------------------

**STVFTYP****Fee Type Validation Form**

FLAT	Flat Fee
BILL	Per Bill Hour Fee
CRED	Per Credit Hour Fee
DURN	Per Duration Unit

**STVGAST****Graduation Application Status Validation Form**

AC	Active Application
IA	Inactivate Application

**STVGCHG****Grade Change Code Validation Form**

CC	Composite Calculation
CR	Capped Resit
DL	Degraded Late Mark
OE	Original Entry
RC	Re-Calculated
SG	Substitute Grade

**STVINTS****Outside Interest Code Validation Form**

A1	Instrumental Music
A2	Vocal Music
A3	Student Government
A4	Publications, Literary
A5	Debate
A6	Departmental Clubs
A7	Dramatics, Theater
A8	Religious Organizations
A9	Racial or Ethnic Organizations
AA	Intramural Athletics
AB	Varsity Athletics
AC	Political Organizations
AD	Radio - TV
AE	Fraternity or Sorority
AF	Special Interest Groups
AG	Campus or Community Service Groups
AH	Art
AI	Coop or Internship Programs
AJ	Dance

<b>STVINTS</b>	<b>Outside Interest Code Validation Form</b>
AK	Environmental or Ecology Activity
AL	Foreign Study Abroad
AM	Honors or Independent Study
AN	ROTC

<b>STVLEVL</b>	<b>Level Code Validation Form</b>
00	Level Not Declared

<b>STVLMOD</b>	<b>Learner Module Validation Form</b>
RECRUIT	Recruiting
ADMISSIONS	Admissions
LEARNER	Student
OUTCOME	Student Outcome

 **Note**

Please note that STVLMOD does not contain a system-required indicator. The indicator resides in the Learner Curriculum Frequency Rules Table (SOBLMOD). The specified values must exist in the table when using curriculum processing. ■

<b>STVMAJR</b>	<b>Major Code Validation Form</b>
0000	Major Not Declared

<b>STVMECL</b>	<b>Mass Entry Column Validation Form</b>	
<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
ACTC_CODE	Athletic - Sports Code	SGAMSPT
ADD_BILL_HRS	Add registration bill hours	SFAMREG
ADD_CAMP_CODE	Add registration campus code	SFAMREG
ADD_CREDIT_HRS	Add registration credit hours	SFAMREG
ADD_CRN	Add registration CRN	SFAMREG
ADD_END_DATE	Add registration end date	SFAMREG
ADD_GMOD_CODE	Add registration grade mode code	SFAMREG
ADD_INSM_CODE	Add registration instructional method code	SFAMREG
ADD_LEVL_CODE	Add registration level code	SFAMREG
ADD_PTRM_CODE	Add registration part of term	SFAMREG
ADD_RSTS_CODE	Add registration status code	SFAMREG

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
ADD_SSTS_CODE	Add registration with registration status code	SFAMREG
ADD_START_DATE	Add registration start date	SFAMREG
ADD_TMST_HRS	Add registration with time status hours	SFAMREG
ADMR_CODE	Admissions checklist code	SAAMAPP
ADMT_CODE	Admissions Code	SAAMAPP
APDC_CODE	Decision code	SAAMAPP
APDC_CODE_MOST_RECENT	Most recent application decision	SAAMAPP
APDC_DATE	Decision date	SAAMAPP
APDC_IND	Current Decision: Accept; Reject; Confirm	SAAMAPP
APST_CODE	Application status	SAAMAPP
APST_DATE	Application status date	SAAMAPP
ATHL_AID_IND	Athletic - Aid Indicator	SGAMSPT
ATTS_CODE	Attribute	SAAMAPP, SGAMSTU
ATYP_CODE	Address type code	SHANDIP
BLCK_CODE	Block code	SFAMREG, SGAMSTU
BLOCK_PROCESS_IND	Block registration processing indicator	SFAMREG
BLOCK_RSTS_CODE	Block registration status code	SFAMREG
BYPASS_REG_ELIG	Bypass registration eligibility check	SFAMREG
CAP_ORDER_DATE	Cap-Gown-Hood tickets order date	SHAMUCA
CAP_ORDER_IND	Cap order indicator	SHAMUCA
CAP_PICKUP_IND	Cap picked up indicator	SHAMUCA
CAP_RETURN_DATE	Cap-Gown-Hood Returned date	SHAMUCA
CAP_RETURN_IND	Cap returned indicator	SHAMUCA
CAP_SIZE	Graduation Cap Size	SHAMUCA
CAP_TYPE	Cap Type	SHAMUCA
CERT_CODE	Ceremony code	SHAMCAT, SHAMUCA
CERT_ORDER_DATE	Order date	SHAMUCA
CERT_PICKUP_DATE	Pickup date	SHAMUCA
CERT_RETURN_DATE	Return date	SHAMUCA
CHKL_SOURCE	Checklist source	SAAMAPP
CHRT_CODE	Cohort code	SAAMAPP, SGAMSTU
CKSR_CODE	Checklist source	SAAMAPP

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
CLAS_CODE	Class code	SFARMEG, SGAMSTU, SAAMAPP, SHAMDEG, SHAMCAT, SHAMDIP
CONFIRM	APDC IND, Student accept	SAAMAPP
CONFIRM_APDC_IND	Student accept	SAAMAPP
COPY_ACTC_CODE	Athletic Copy - Copy Sports Code	SGAMSPT
COPY_ATTR_COHORT	Copy attribute and cohort to new term	SGAMSTU
COPY_ATTRIBUTES	Athletic Copy - Copy All Attributes from Search Term	SGAMSPT

INTS_CODE	Interest code	SAAMAPP
LCUR_ADMIT_TERM	Learner admission term	SGAMSTU
LCUR_ADMT_CODE	Learner admission code	SGAMSTU
LCUR_CAMP_CODE	Campus	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_COLL_CODE	College	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
LCUR_CURRICULA	Which curricula to review: Primary, Secondary or All	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_DEGC_CODE	Degree	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_DEPT_CODE	Department	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_LEVL_CODE	Level	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_LFST_CODE	Field of study type	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_MAJR_CODE	Field of study code	SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LCUR_MATRIC_TERM LCUR_PROGRAM	Learner matriculation term Program	SGAMSTU SAAMAPP, SFAMREG, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI
LETR_CODE	Letter code	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA
LETR_DATE	Initiated date on the letter	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA
LETR_INIT_CODE	Letter initials code	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
LETR_PRINT_DATE	Date letter was printed	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA
LETR_WAIT_DAYS	Wait days on the new letter	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA
MANDATORY_IND	Admissions checklist mandatory indicator	SAAMAPP
NUMBER_TICKETS	Number of Tickets	SHAMUCA
POPSEL_APPLICATION_ID	Population Selection Application	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA, SFAMREG
POPSEL_CREATOR_ID	Population Selection Creator ID	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA, SFAMREG
POPSEL_SELECTION_ID	Population Selection ID	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA, SFAMREG
POPSEL_USER_ID	Population Selection User ID	SAAMAPP, SGAMSPT, SGAMSTU, SHAMDEG, SHAMCAT, SHAMDIP, SHAMUDI, SHAMUCA, SFAMREG
RATE_CODE	Student fee assessment rate code	SGAMSTU, SAAMAPP, SFAMREG
REG_CHECK_APPR	Indicator to check for approvals	SFAMREG
REG_CHECK_ATTS	Indicator to check for student attributes	SFAMREG
REG_CHECK_CAMP	Indicator to check for campus	SFAMREG
REG_CHECK_CAPC	Indicator to check for capacity	SFAMREG
REG_CHECK_CHRT	Indicator to check for cohort	SFAMREG
REG_CHECK_CLAS	Indicator to check for class	SFAMREG
REG_CHECK_COLL	Indicator to check for college	SFAMREG
REG_CHECK_CORQ	Indicator to check for corequisites	SFAMREG

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
REG_CHECK_DEGREE	Indicator to check for degree	SFAMREG
REG_CHECK_DEPT	Indicator to check for department	SFAMREG
REG_CHECK_DUPL	Indicator to check for duplicates	SFAMREG
REG_CHECK_HOLD	Indicator to check for holds	SFAMREG
REG_CHECK_LEVL	Indicator to check for level	SFAMREG
REG_CHECK_LINK	Indicator to check for linked courses	SFAMREG
REG_CHECK_MAJR	Indicator to check for fields of study	SFAMREG
REG_CHECK_MAXH	Indicator to check for maximum hours	SFAMREG
REG_CHECK_MEXC	Indicator to check for mutual exclusions	SFAMREG
REG_CHECK_MINH	Indicator to check for minimum hours	SFAMREG
REG_CHECK_PREQ	Indicator to check for prerequisites	SFAMREG
REG_CHECK_PROGRAM	Indicator to check for program	SFAMREG
REG_CHECK_REPT	Indicator to check for repeats	SFAMREG
REG_CHECK_RPTH	Indicator to check for repeat hours	SFAMREG
REG_CHECK_TIME	Indicator to check for time conflict	SFAMREG
REG_CURRENT_CRN	Currently in CRN	SFAMREG
REG_DATE	Registration date	SFAMREG
REG_FEE_ASSESSMENT	Process fees in batch or online	SFAMREG
REG_GRADE_MODE	Grade mode for currently registered CRN	SFAMREG
REJECT	ADPC IND, Student rejected	SAAMAPP
REJECT_ADPC_IND	Student rejected	SAAMAPP
RESD_CODE	Residence Code	SAAMAPP, SGAMSTU
RETURN_DATE	Tickets returned date	SHAMUCA
SAAT_CODE	Athletic - Attribute Code	SGAMSPT
SAEL_CODE	Athletic - Academic Eligibility	SGAMSPT
SBGI_INST_AWARD	Awarding institution	SHAMDIP
SEASON_USED_IND	Athletic - Season Used Indicator	SGAMSPT
SPST_CODE	Athletic - Status Code	SGAMSPT
STST_CODE	Student status	SGAMSTU
STYP_CODE	Student type code	SAAMAPP, SGAMSTU
TERM_CODE_APPL	Admissions application term	SAAMAPP
TERM_CODE_ATHL_COMP	Athletic - Compliance Term Code	SGAMSPT

**STVMECL****Mass Entry Column Validation Form**

<b>Mass Entry Code</b>	<b>Description</b>	<b>Mass Entry Forms Used</b>
TERM_CODE_ATHL_COPY	Athletic - Copy Compliance Term Code	SGAMSPT
TERM_CODE_CERT	Ceremony term	SHAMCAT, SHAMDIP, SHAMUCA, SHAMUDI
TERM_CODE_DEGREE_COMPLETION	Term the degree is completed	SHAMDEG
TERM_CODE_EFF	Learner effective term	SGAMSTU, SFAMREG
TERM_CODE_EFF_IND	Term code equal indicator	SGAMSTU
TERM_CODE_GRAD	Graduation term	SHAMDEG, SGAMSTU, SHAMCAT, SHAMDIP
TERM_CODE_REG	Registration term	SFAMREG
TICKET_MAILED	Tickets mailed date	SHAMUCA
TICKET_ORDER_IND	Ticket order indicator	SHAMUCA
TICKET_PICKUP_IND	Ticket picked up indicator	SHAMUCA
WITHDRAWN_IND	Student withdrew	SAAMAPP

**STVORIG****Originator Code Validation Form**

AUTO      Generated Automatically

 **Note**

Please note that STVORIG does not contain a system-required indicator. However, it is recommended that the value *AUTO* exist when CAPP compliance processing is used at your institution. If this value does not exist, batch compliance will not run successfully. ■

**STVPREV****Progress Evaluation Code Validation Form**

**STVPTRM      Part of Term Code Validation Form**

1      Full Term  
C      Combined Parts of Term

**STVRATP      Admissions Rating Type Validation Form**

0000      Admissions Rating

**STVRECR      Recruiter Code Validation Form**

000      Recruiter Not Assigned  
(for Tape Load Interface users only)

**STVRES D      Residence Code Validation Form**

0 †      Undeclared  
†*Note for clients in production prior to 1994.*  
If your institution is already using 0 (zero) for a value other than “Undeclared”, you must assign one value which is not otherwise being used as a system-required “Undeclared” value.

**STVRSTA      Recruiting Status Code Validation Form**

00      Undetermined - New Recruit  
(for Tape Load Interface users only)

**STVRSTS      Course Registration Status Code Validation Form**

RE      Registered  
DD      Delete  
DC      Drop Course  
WL      Waitlisted

**STVSBGI      Source/Background Institution Code Validation Form**

999999      Miscellaneous Institution

 **Note**

Please note that STVSBGI does not contain a system-required indicator. However, it is recommended that the value 999999 exist when AMCAS processing and/or transfer course processing is used at your institution. If this value does not exist, processing may not run successfully. It is also recommended that the value 999999 exist on SHATRNS so you can enter

a name for the institution when you are entering transfer work for a person. ■

**STVSTSP Student Study Path Status Code Validation Form**

AS Active Study Path Active and Allow Registration = checked (Yes) Y

**STVSTST Student Status Code Validation Form**

Value in database

AS Active Student Allow Registration = checked (Yes) Y  
 IS Inactive Student Allow Registration = unchecked (No) N

**STVSTYP Student Type Code Validation Form**

0 \* Undeclared

*\* Note for clients in production prior to 1994:*

If your institution is already using 0 (zero) for a value other than “Undeclared”, you must assign one value which is not otherwise being used as a system-required “Undeclared” value.

**STVTERM Term Code Validation Form**

# Validation Forms Menu System

---

The following page shows a diagram of the menu hierarchy for the Banner Student System and Accounts Receivable module validation forms. All of the validation forms are listed alphabetically and are grouped by submenu. Each submenu is listed with a notation as to which validation forms are included on it. To find which menu a form is on, check the alphabetic range in which it falls.

For example, to locate STVTERM, you see it falls between STVTELE and STVTRAC and would be listed on submenu \*STDVALD3F.

Use this menu system to view the validation forms used in the Banner Student System. Updates to validation forms can also be done by entering the name of the form you want and retrieving it directly in expert mode, or by using the subsystem of menus to navigate to the desired form. The validation forms are listed alphabetically. Updates and additions are made directly on the validation form.

# Validation Forms System Reference

---

This list references the system validation forms which are used by Banner Student System functional/application forms and their related modules.

# 3 Process Flows

## Banner Student System Overview Process Flow

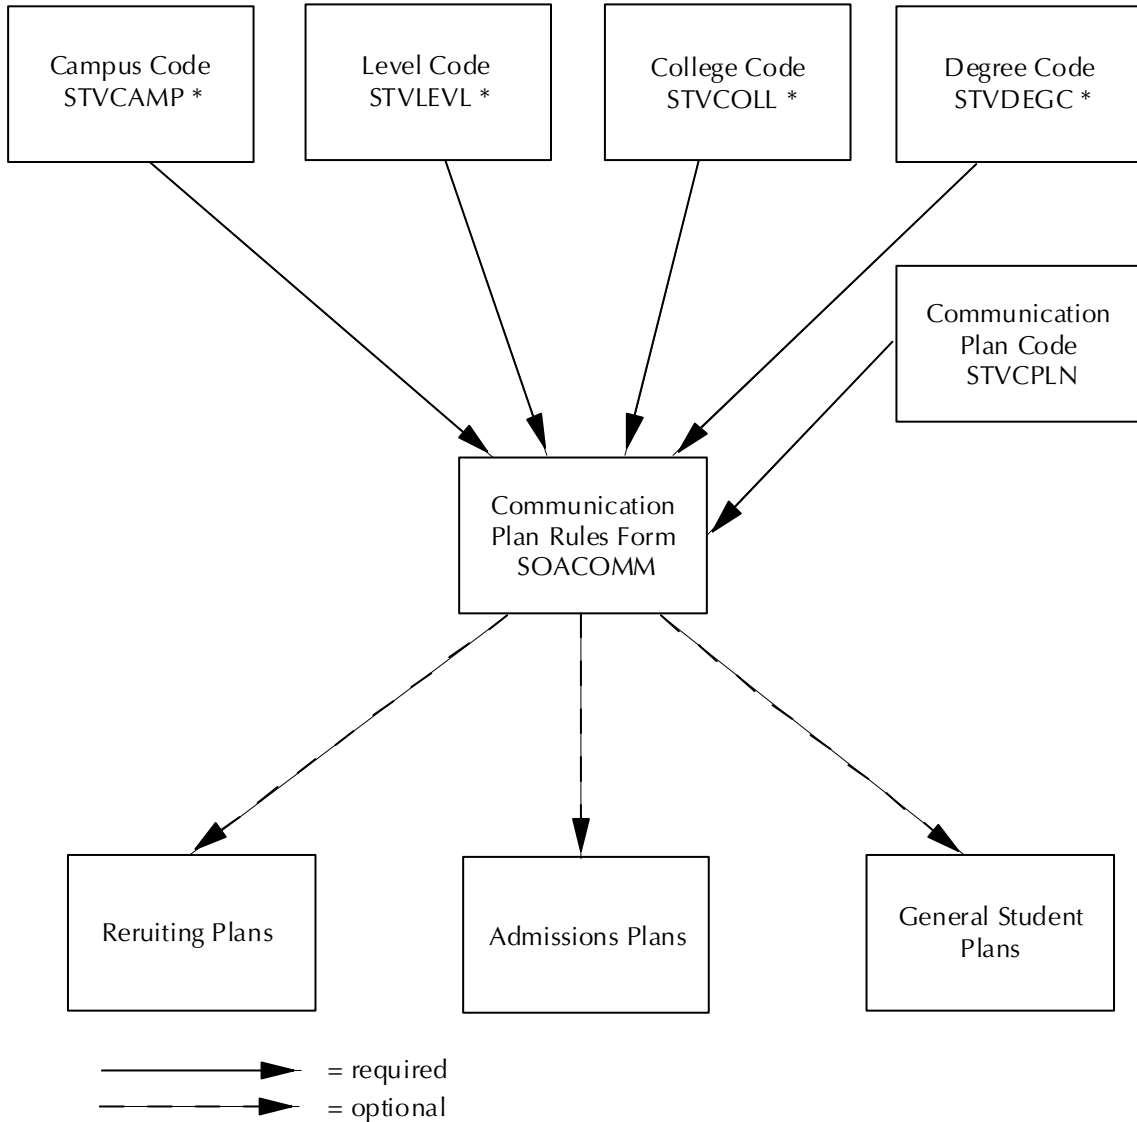

---

This process flow illustrates the high level relationships of the Banner® Student modules and the points at which data is shared with other Banner systems (Banner Advancement, Banner Human Resources, Banner Finance, and Banner Financial Aid).

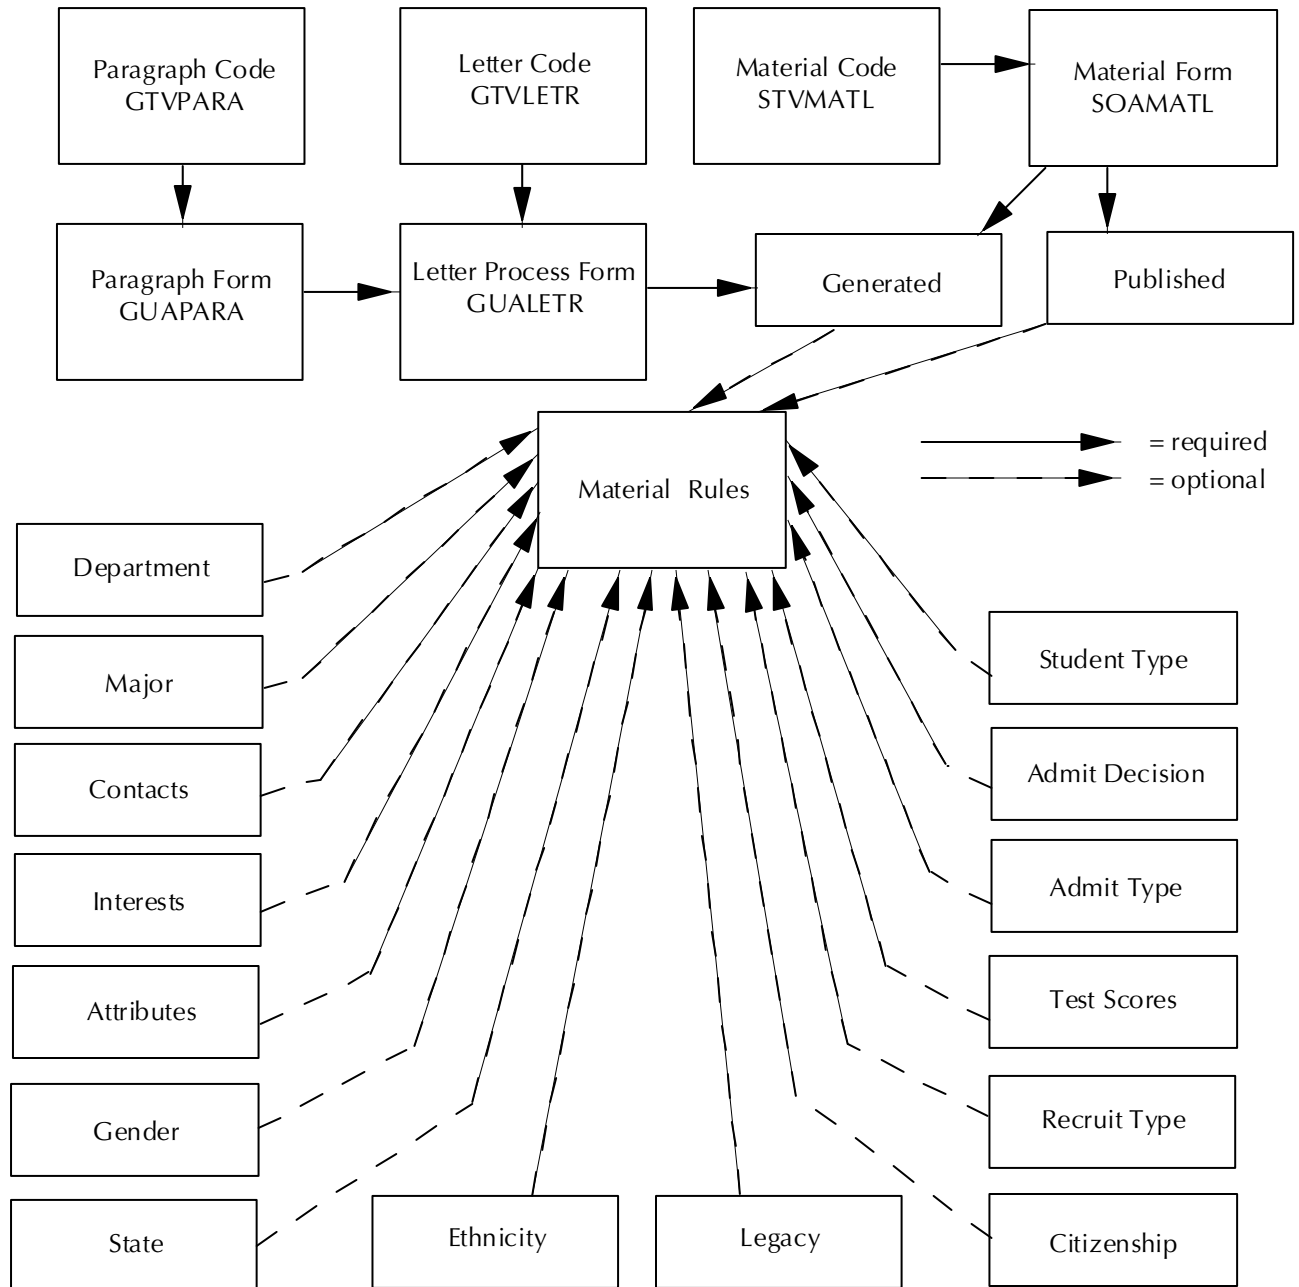

# Communication Plan Process Flows

## Establish Communication Rules

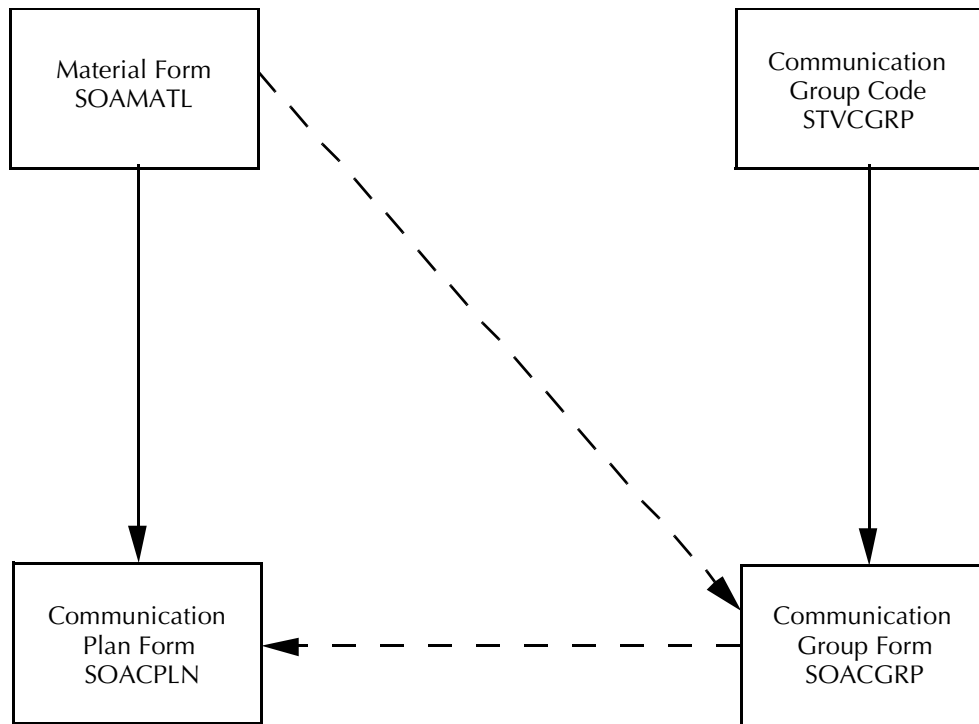

\* = At least one of the codes (campus, level, college, or degree) is required for a Communication Plan rule.

## Establish Materials and Rules

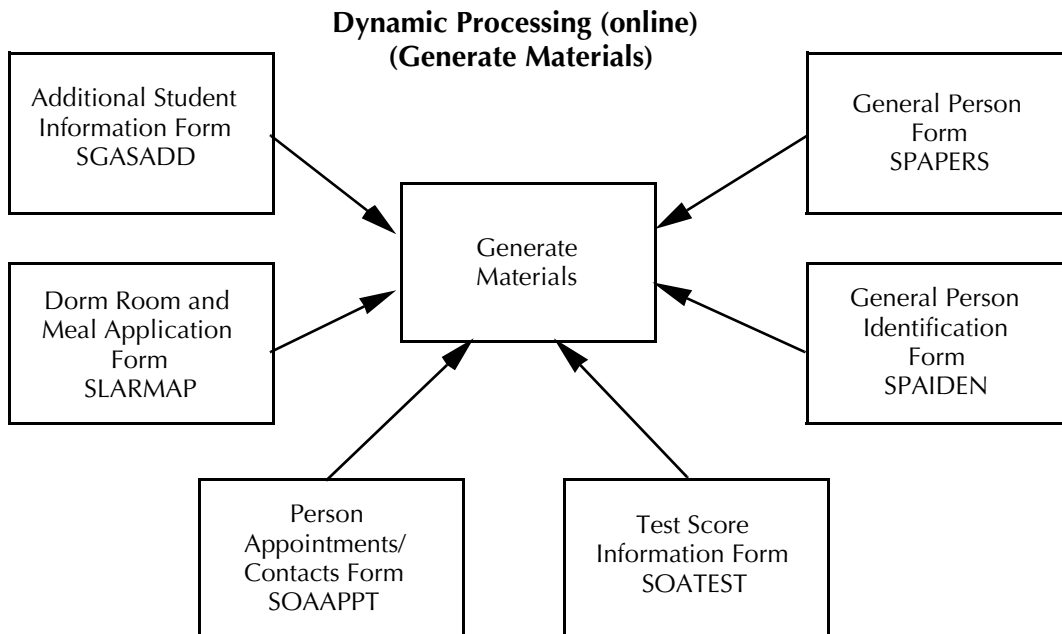

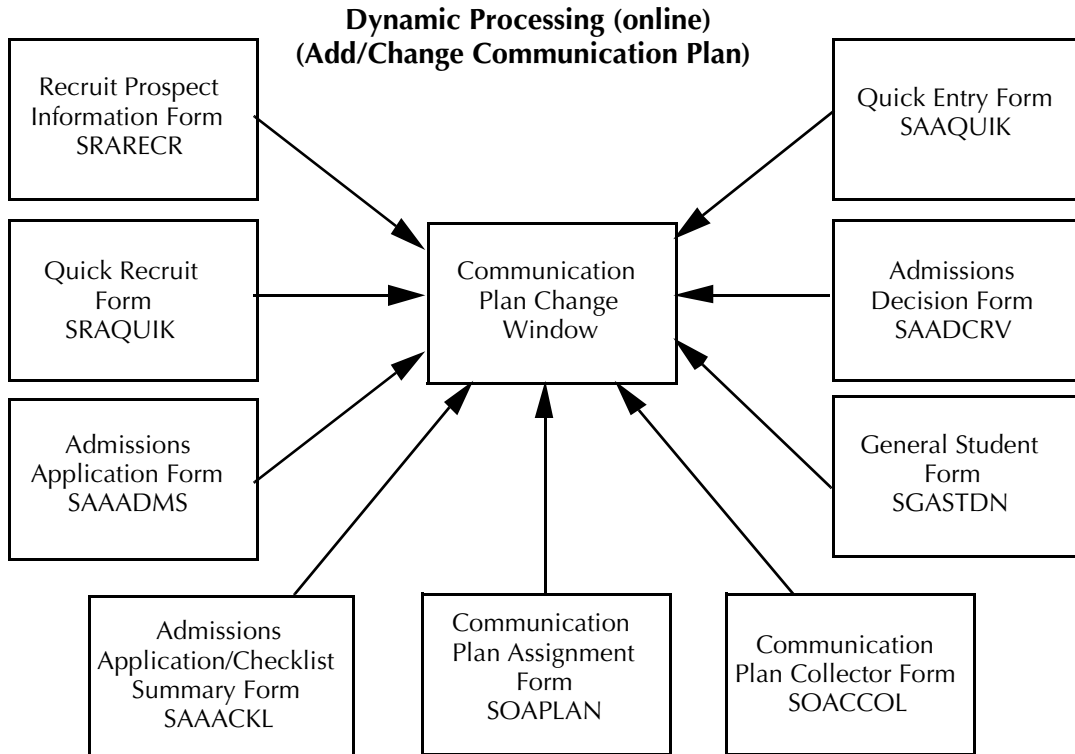

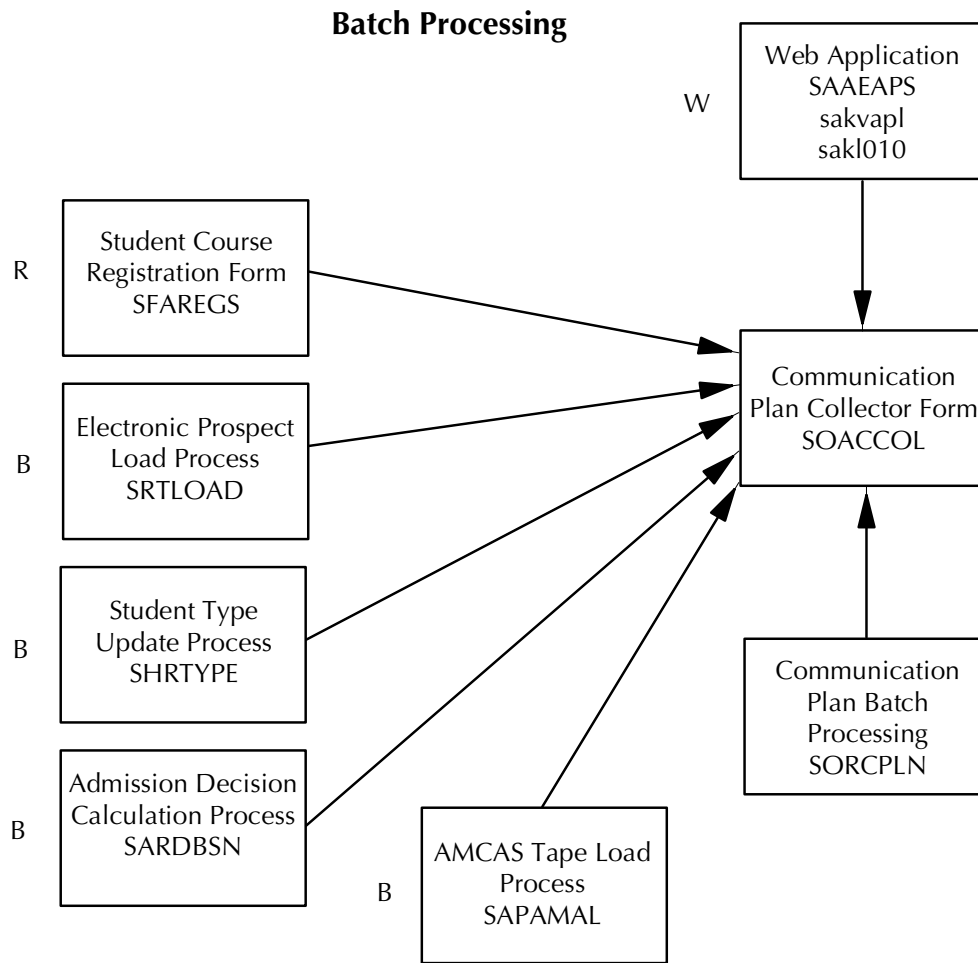

## Assign Materials to Communication Plans

## Processing Communication Plans Online

# Processing Communication Plans in Batch

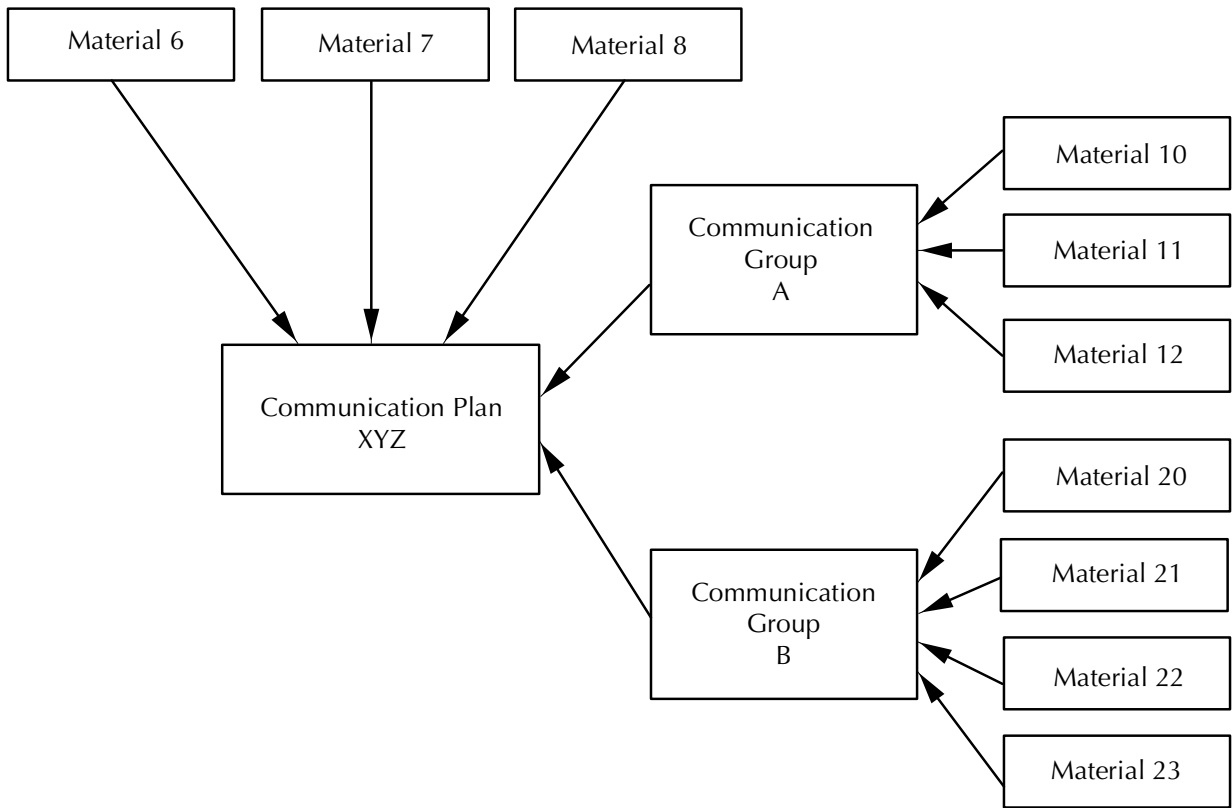

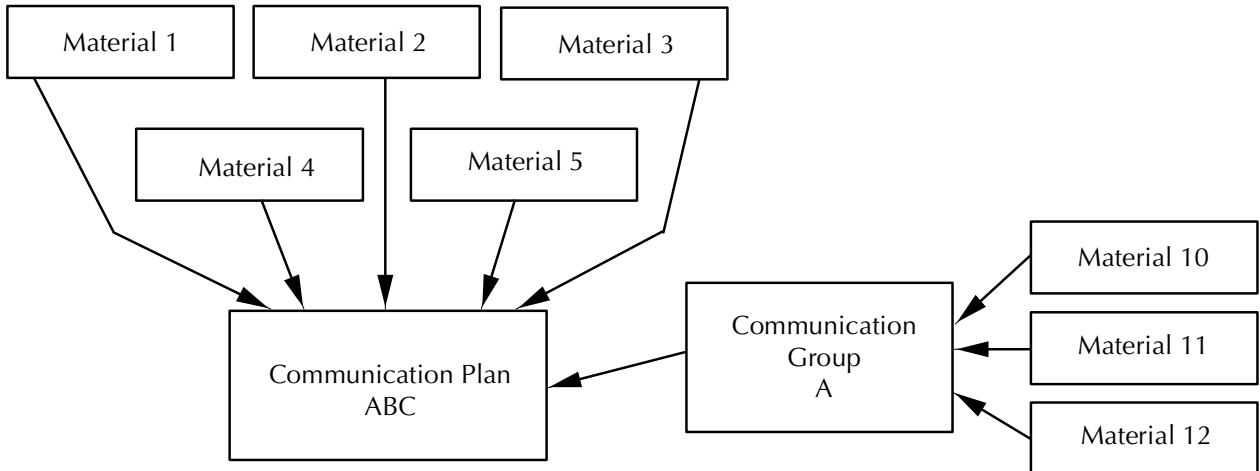

Source: W - Web  
R - Registration  
B - Batch updates

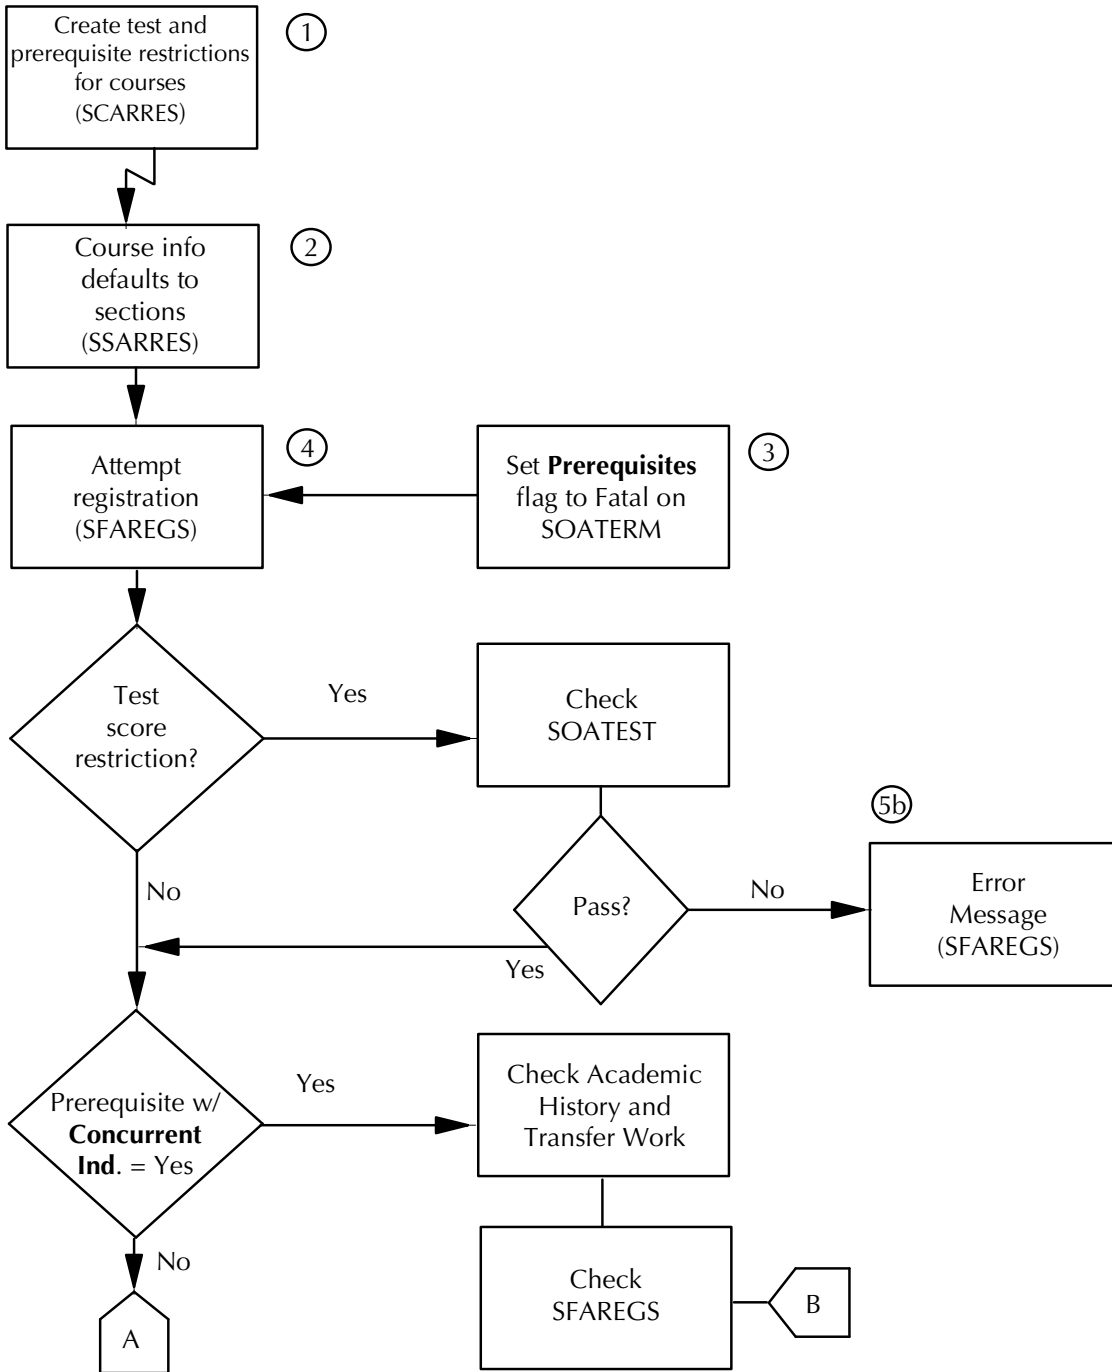

# Building Communication Plans

Communication Plans consist of:

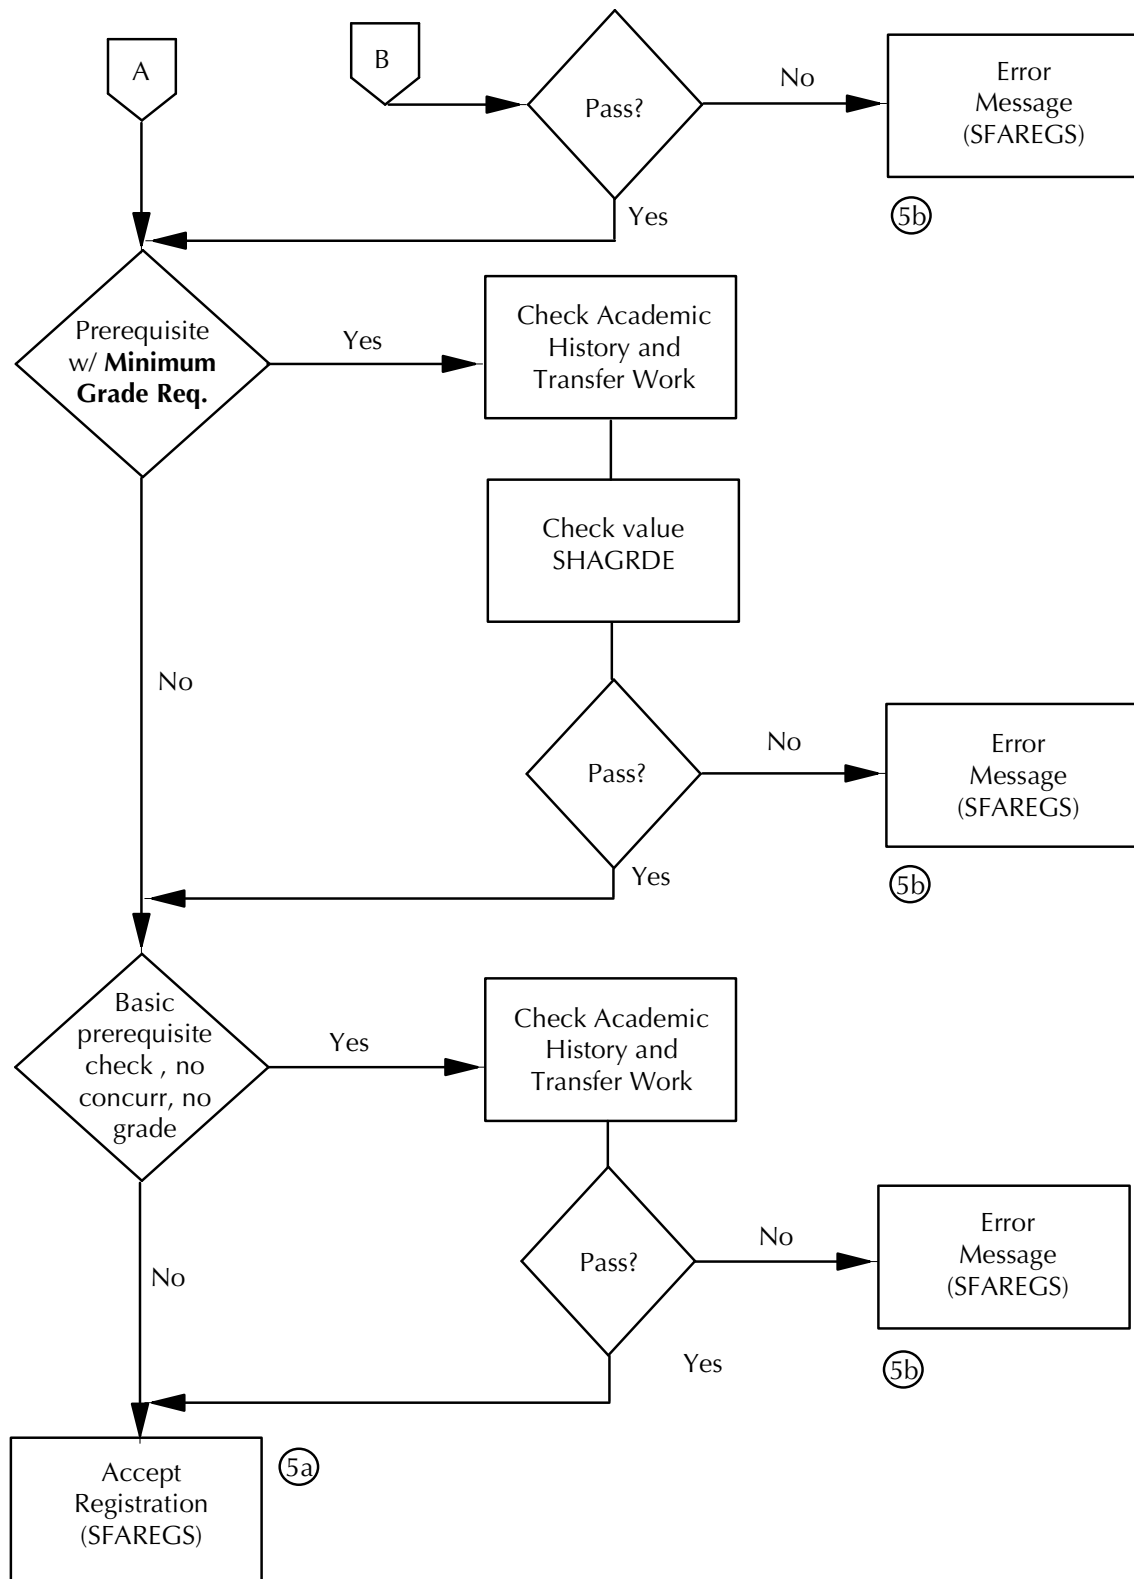

- Materials (published and/or generated) which are required
- Communication Groups which are optional and consist of Materials

# Test Score Restrictions and Prerequisites Process Flow

### Test Score Restrictions and Prerequisites Process Flow (continued)

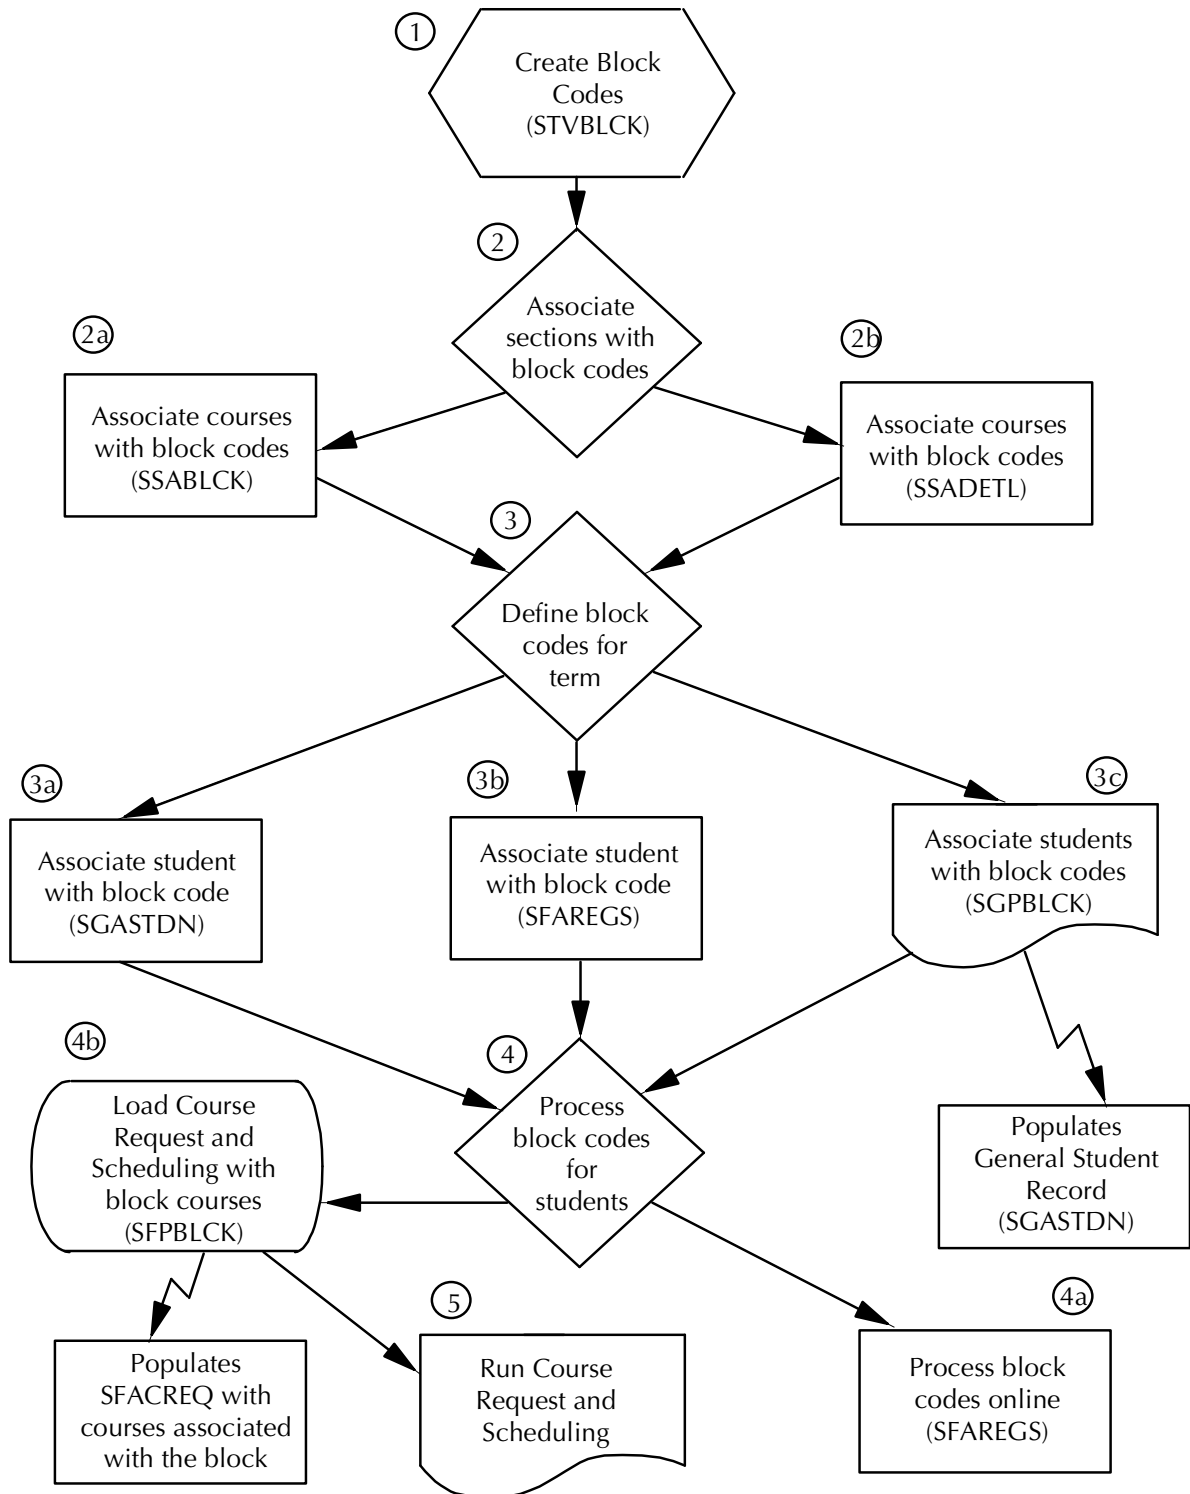

## Test Score Restrictions and Prerequisites Process Flow Narrative

The following steps are necessary when performing Test Score Restrictions and Prerequisite processing.

1. Create test score restrictions and prerequisites at the Catalog level in the Course Registration Restrictions Form (SCARRES).
2. The data created at the Catalog level in step 1 will default to the sections when they are created. Test score restrictions and prerequisites may be modified at the section level in the Schedule Restrictions Form (SSARRES).
3. The **Prerequisites** radio group on the Term Control Form (SOATERM) must be set to Fatal to check for test score restrictions and prerequisites.
4. During registration in the Student Course Registration Form (SFAREGS), if a section has test score restrictions and/or prerequisites, the system will check test scores, prerequisites, and grades, depending on the restrictions that exist for the section.
5. The restrictions are checked.
  - 5.1. If all required restrictions are met by the student, registration will be accepted.
  - 5.2. If the student fails any portion of the required restrictions check, an error message will be generated on the Student Course Registration Form (SFAREGS). These errors can be overridden.

# Block Scheduling Process Flow

## Block Scheduling Process Flow Narrative

The following steps are necessary when performing Block Scheduling processing.

1. Create block codes on the Block Code Validation Form (STVBLOCK).
2. Begin to associate sections of courses with the block codes. This may be done in one of two ways.
  - 2.1. On the Block Schedule Control Form (SSABLCK), enter a valid term and block code, and then enter the courses in the Block Schedule Section information that you would like to associate with the block code. You have now added sections to a block code for a term.
  - 2.2. On the Schedule Detail Form (SSADETL), enter the term and CRN you wish to associate with a block, and then add that block code to the course via the Block Schedule Code information. You have now added sections to a block code for a term.
3. Associate students with block codes in one of three ways.
  - 3.1. On the General Student Form (SGASTDN), add the block code to the **Block** field in the Additional Information block. You have now associated the student with a block code.
  - 3.2. On the Student Course Registration Form (SFAREGS), using the ID number in the Key Information for a student who is to be associated with a block code, enter the block code in the **Block Schedule** field in the Student Term window. You have now associated a student with a block code.
  - 3.3. Load the student block codes in batch via population selection and the Student Block Load Process (SGPBLCK). You have now associated a student with a block code.

This will populate the General Student Record on the General Student Form (SGASTDN).

4. Process the block codes in one of two ways.
  - 4.1. On the Student Course Registration Form (SFAREGS), using the ID number in the Key Information of a student who is to be processed with a block code, check the **Process Block** box and then perform a Next Block function. This will default those CRNs associated with the block into the student's Student Course Registration Form. All error checking will be controlled by the Term Control Form (SOATERM) and is performed upon saving this data.

### Note

To process block codes in batch, the user must load students with block codes into Course Request and Scheduling. This will be done by using a

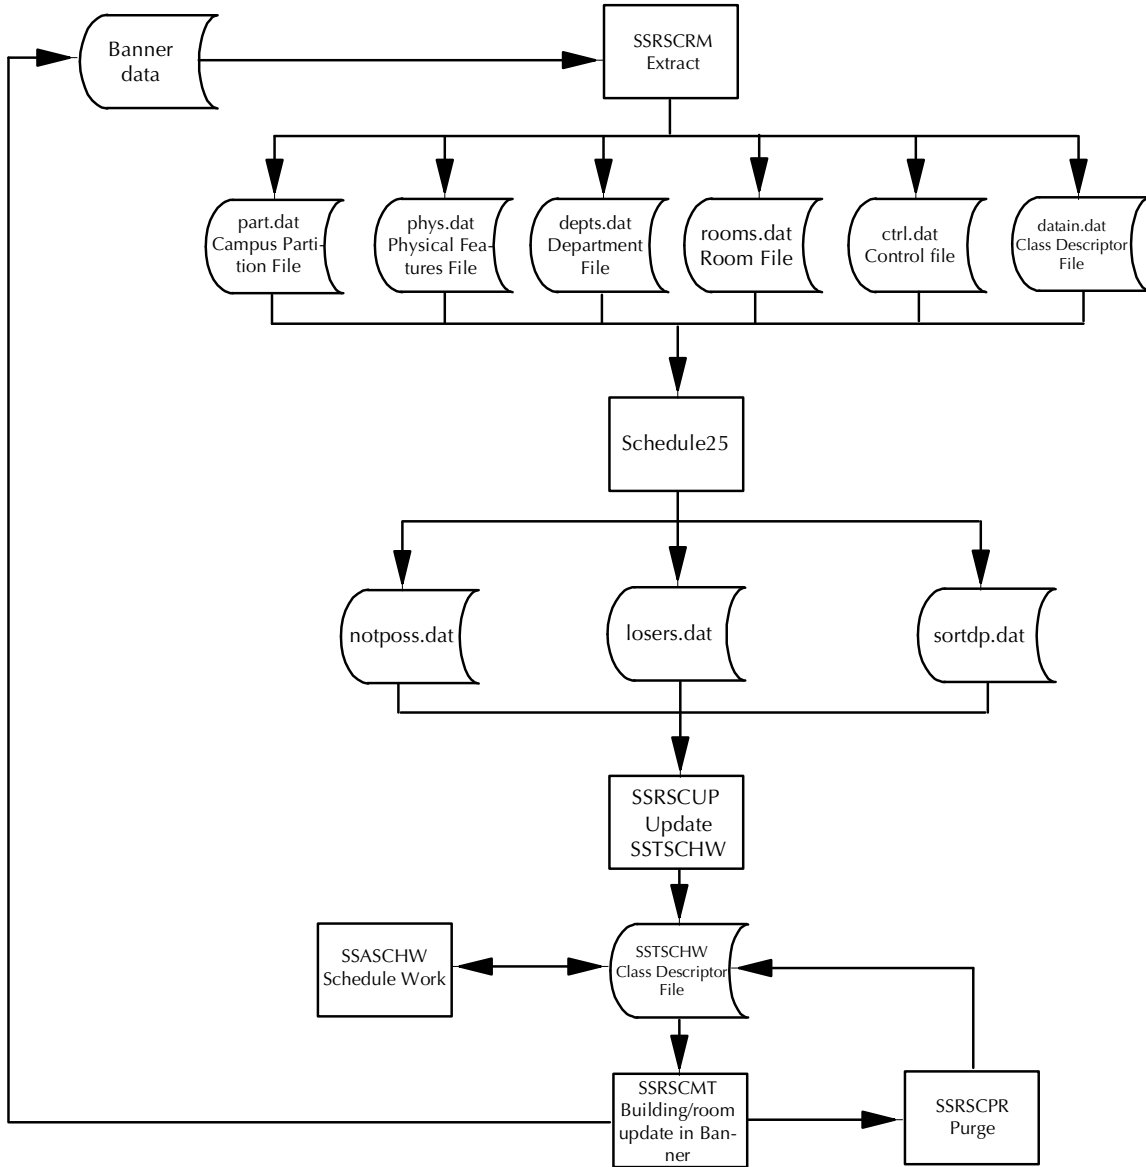

population selection and then running the Course Request Load Process (SFPBLCK). **Note:** The population selected must have a block code associated with it in order to be processed. ■

These steps will populate the Student Course Request Form (SFACREQ) with those courses associated with the block.

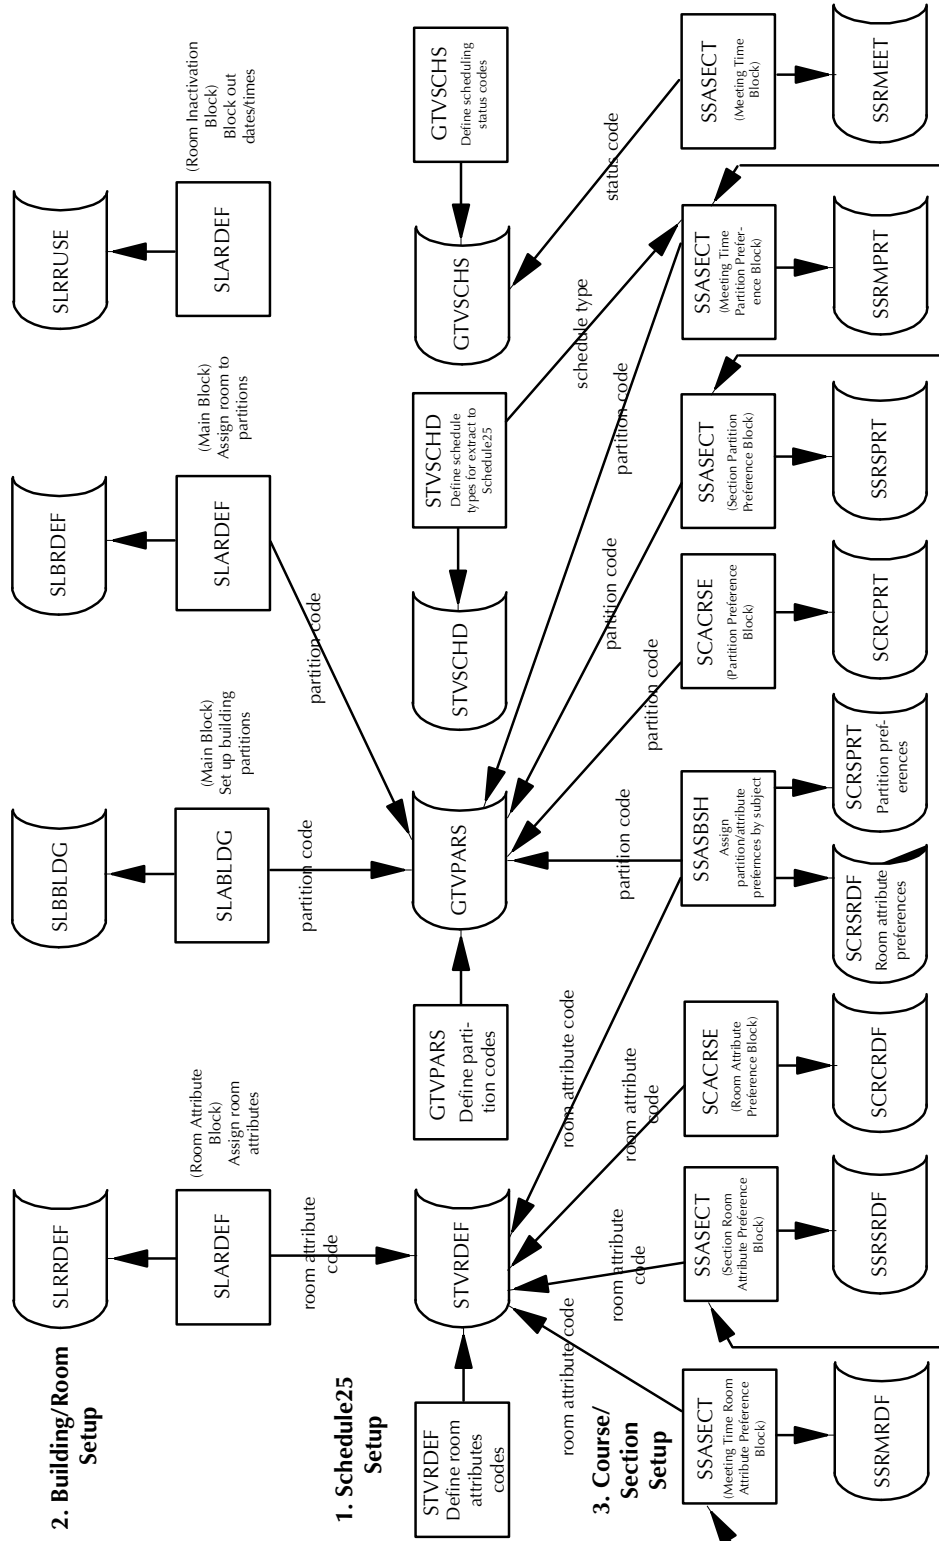

5. You are now ready to run Course Request and Scheduling.

# Admissions Process Flow

---

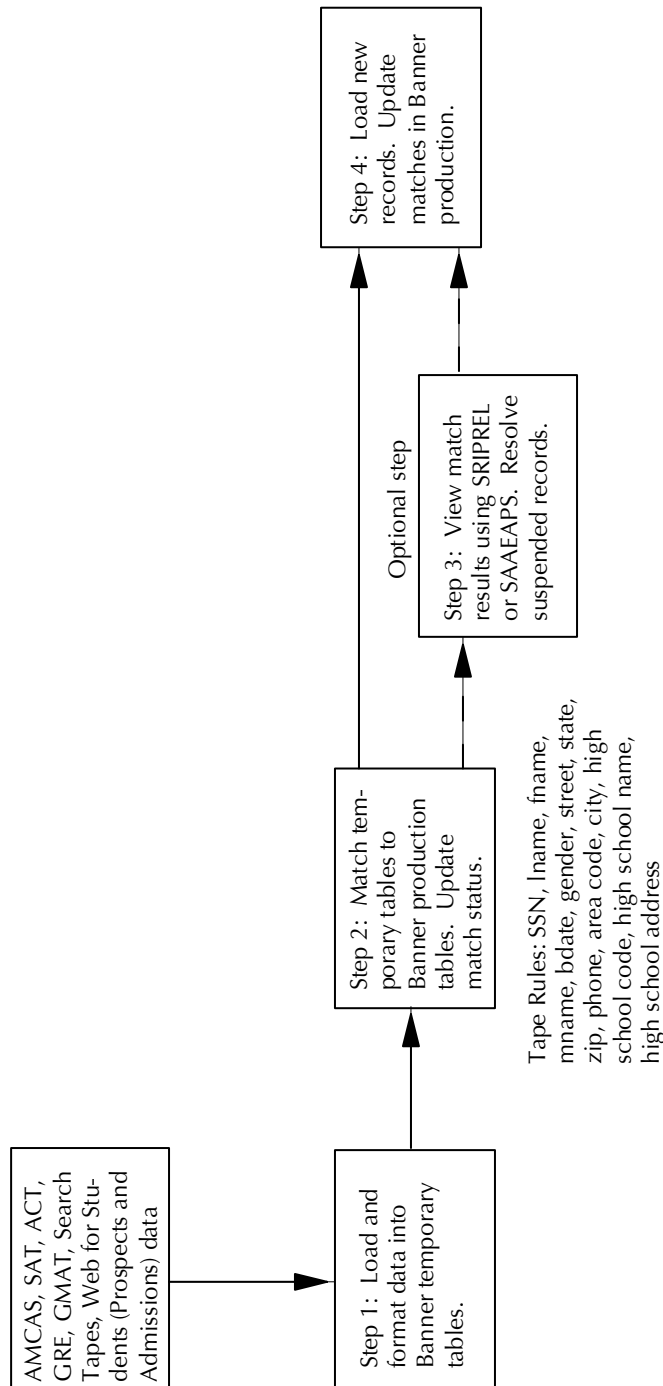

## Admissions Process Flow Narrative

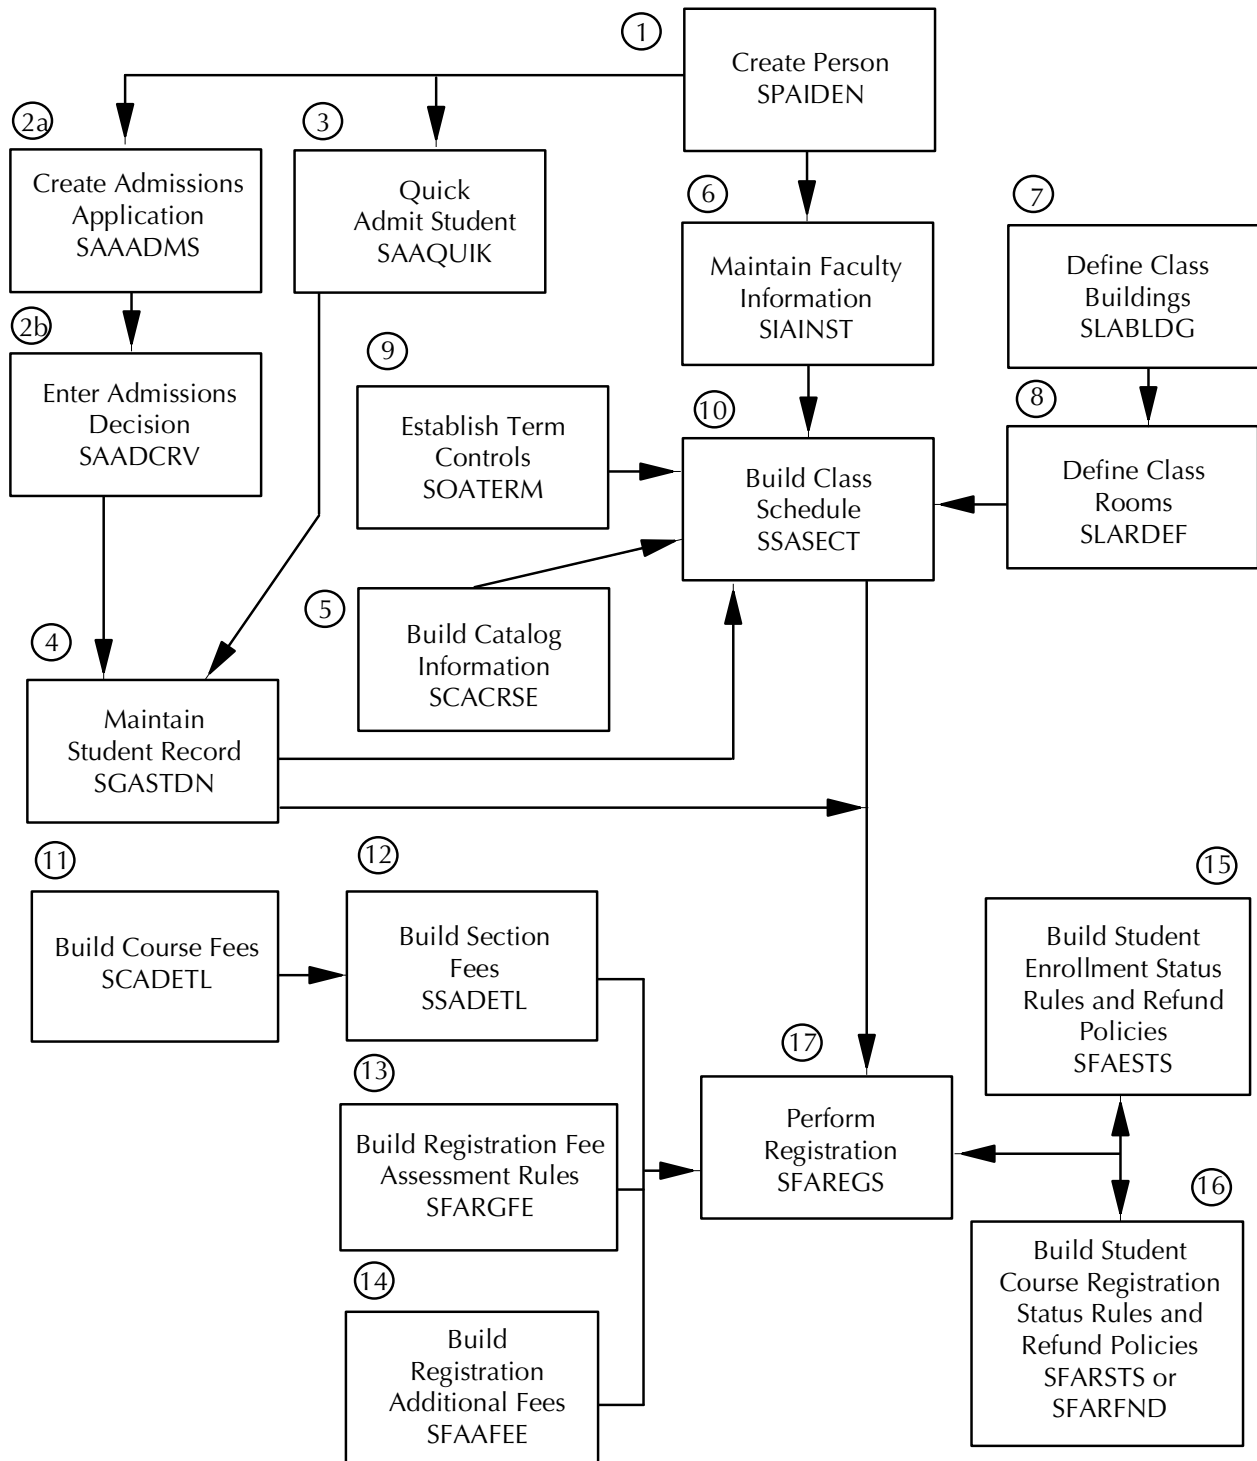

The following steps are necessary when processing Admissions information. Please note that all other processes in the Admissions module are optional.

1. Create a person on the system using the General Person Identification Form (SPAIDEN) to record an identification number, name, and address. This form defines persons (i.e., students, instructors, advisors) and non-persons (i.e., companies) and captures biographic/demographic information specific to persons and non-persons associated with the institution. A person must exist on the database in order to proceed any further with the admissions process.
2. Enter biographic information about a person on the General Person Form (SPAPERS). This form contains personal data such as birth date, sex, marital status, full legal name, and if a person is deceased.
3. Use the Admissions Checklist Rules Form (SAACHKB) to build admissions request checklist items that will be automatically generated when an application is entered on the system. Applicant criteria that matches checklist criteria will cause checklist items to be added to the applicant's checklist.
4. Create an applicant on the Admissions Application Form (SAAADMS) to establish an admissions record. User-defined rules for the required items that were built on SAACHKB will automatically be entered if the applicant matches those rules.
5. Use the High School Information Form (SOAHSCH) to build high school career information such as name, address, graduation date, subjects taken, course and overall GPA, class rank/size, and transcript date.
6. Use the Test Score Information Form (SOATEST) to build test score information required for admission to the institution. Scores may be entered manually, and system updates may be performed via tape load processes (i.e., tapes for SAT, ACT, GRE, GMAT test scores).
7. If an applicant has prior college experience, proceed to step #8. If the applicant has no prior college experience, proceed to step #9.
8. Enter prior college information on the Prior College Form (SOAPCOL) such as degrees, majors, minors, areas of concentration, number of hours, GPA, transcript date, and dates of attendance.
9. Enter an admissions decision on the Admissions Decision Form (SAADCRV). After an applicant accepts the institution's offer of admission and the decision has been entered on SAADCRV, a General Student record is created by the system. The student is now eligible to register.

# External Tape Load Process Flow

# Registration Process Flow

## Registration Process Flow Narrative

The following steps are necessary to prepare for Registration.

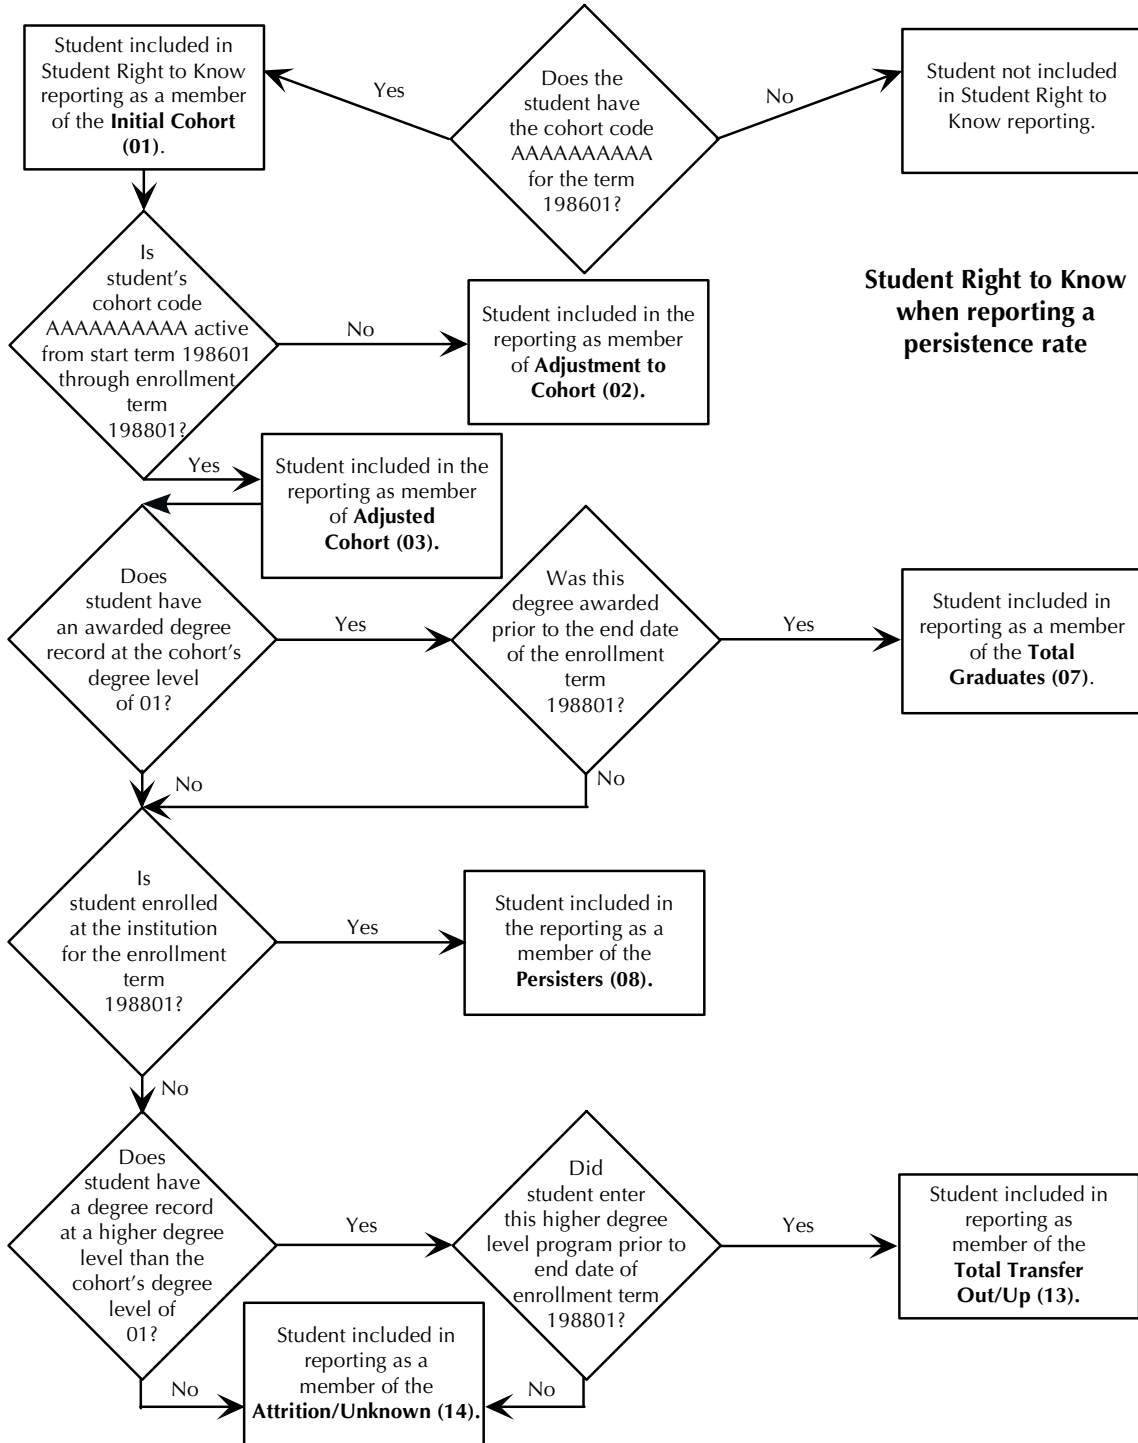

1. Create a person on the system using the General Person Identification Form (SPAIDEN) to record an identification number, name, and address. This form is used to define persons in the database. A person must exist on the system before being made an applicant or faculty member.
2. Create an applicant or enter an admissions decision in the system.
  - 2.1. Create an applicant on the Admissions Application Form (SAAADMS) to establish an admissions record. User-defined rules for the required items that were built on SAACHKB will automatically be entered if the applicant matches those rules. SAAADMS contains fields which indicate if an application decision has been made.
  - 2.2. Enter an admissions decision on the Admissions Decision Form (SAADCRV). (The Decision Calculator window of the form provides a means of automatically calculating the admissions decision based on the rules from SAADCSN.) After an applicant accepts the institution's offer of admission and the decision has been entered on SAADCRV, a General Student record (which is required for registration) is created by the system.
3. Enter a student into the system using the Quick Entry Form (SAAQUIK). This will automatically create a General Student record, which is required for registration, and can be used to create recruiting and/or admissions records.
4. Maintain an existing student record on the General Student Form (SGASTDN). The student record contains current information about a student, including comments, activities, and veteran information. The creation of this record is dependent upon the student's acceptance of an offer of admissions from SAADCRV or the quick entry processing of SAAQUIK.
5. Create and maintain course catalog information (title, department, credit hours) for the institution on the Basic Course Information Form (SCACRSE). Courses must be added to the catalog via SCACRSE.
6. Use the Faculty/Advisor Information Form (SIAINST) to enter and maintain information such as status, category, staff type, contract, workload rule(s), college, and department for a member of the faculty. A faculty member, like a student, must be entered into the system via SPAIDEN. Faculty members must also have an active status in order to be assigned to teach a course.
7. Use the Building Definition Form (SLABLDG) to build and maintain data about all the buildings used in Location Management for classroom assignments. Data may also include location, attributes, categories, and comments.

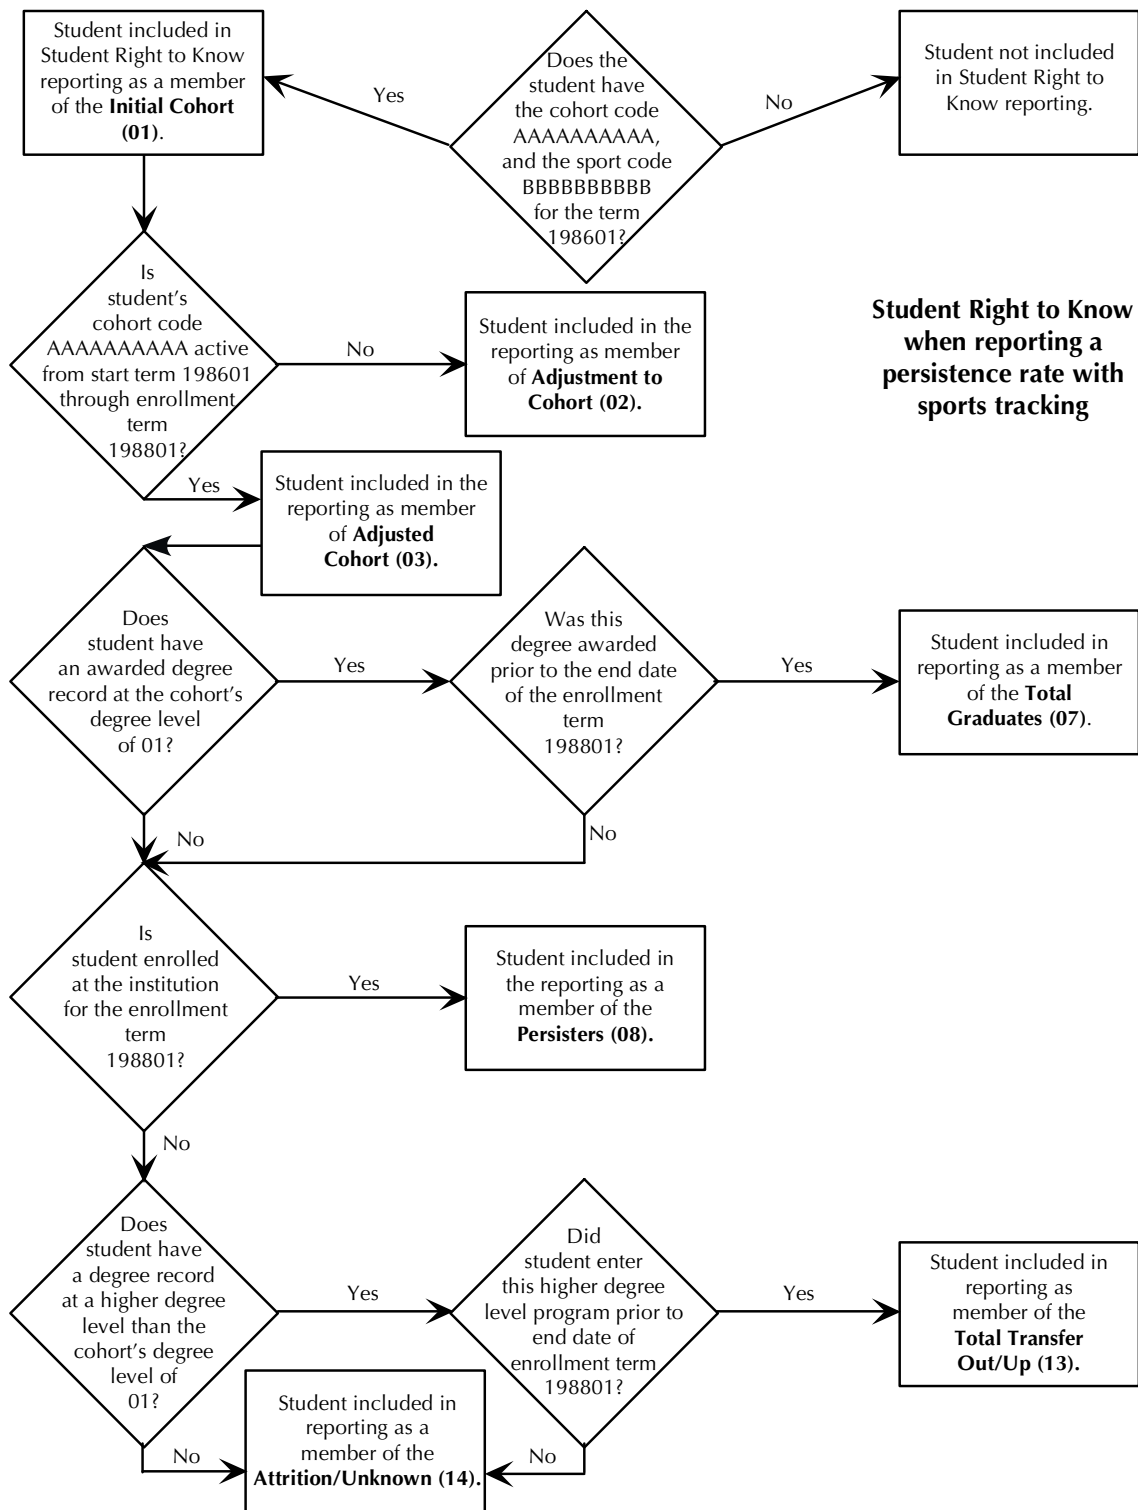

8. Use the Room Definition Form (SLARDEF) to define classrooms in the buildings previously defined on SLABLDG.
9. Use the Term Control Form (SOATERM) to establish controls for fee assessment, tracking by CRN, refunding options, online assessments, registration error checking, and part-of-term information for a specific term. These controls affect schedule, registration, and registration fee assessment.
10. Use the Schedule Form (SSASECT) to build and maintain the schedule of classes according to definitions and restrictions defined in the Course Catalog. SSASECT creates sections of courses which are defined in the catalog. These sections are used to register the students for classes. The Schedule form also tracks class information such as beginning and ending time, building, room, number of sessions, instructor workload, reserved seats, seats remaining, and waitlists.
11. Use the Course Detail Information Form (SCAETL) to build and maintain course level fee information.
12. Use the Schedule Detail Form (SSAETL) to build and maintain section level fee information for use in student billing.
13. Use the Registration Fees Process Control Form (SFARGFE) to build the institution's registration fee assessment policy by student, course level, and campus for student billing.
14. Use the Registration Additional Fees Control Form (SFAAFEE) to enter additional fees, fee codes, and amounts to be charged at registration for student billing.
15. Build student enrollment status rules and refund policies by term on the Enrollment Status Form (SFAESTS). SFAESTS interacts with the Course Registration Status Form (SFARSTS) or the Registration Fee Assessment Refund by Total Rules Form (SFARFND) (if refunding by total).
16. Build student course registration status rules and refund policies by term on the Course Registration Status Form (SFARSTS). SFARSTS interacts with the Enrollment Status Form (SFAESTS) or the Registration Fee Assessment Refund by Total Rules Form (SFARFND) (if refunding by total).
17. Register a student for course sections, perform adds, drops, and withdrawals, and print student schedules or bills on the Student Course Registration Form (SFAREGS). This form also assesses the charges related to the registration and passes them to the Accounts Receivable module.

# Student Right to Know Process Flows

## Data Process Flow

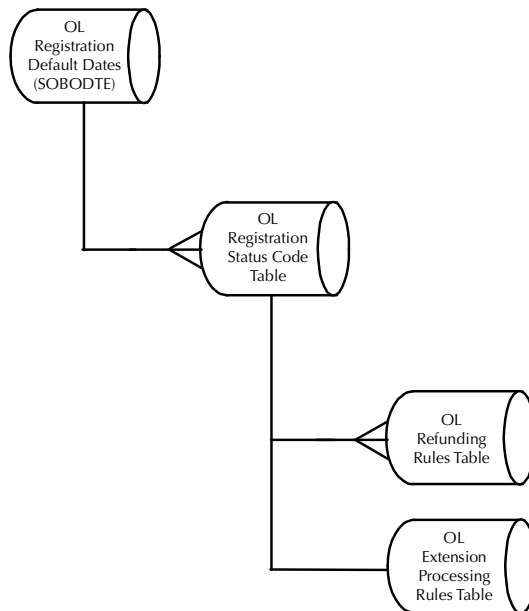

# Overall Process Flow

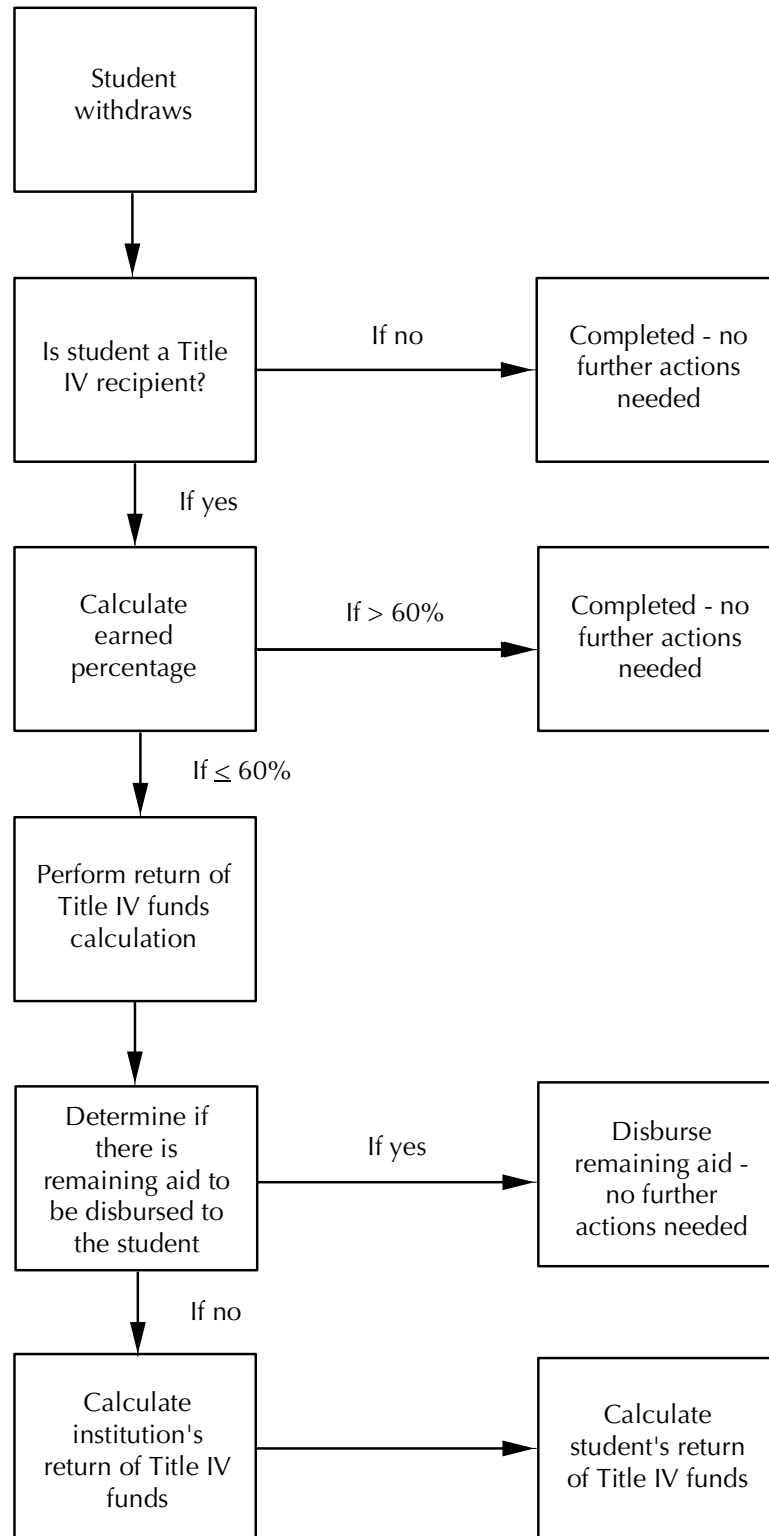

## Rules Use Process Flow

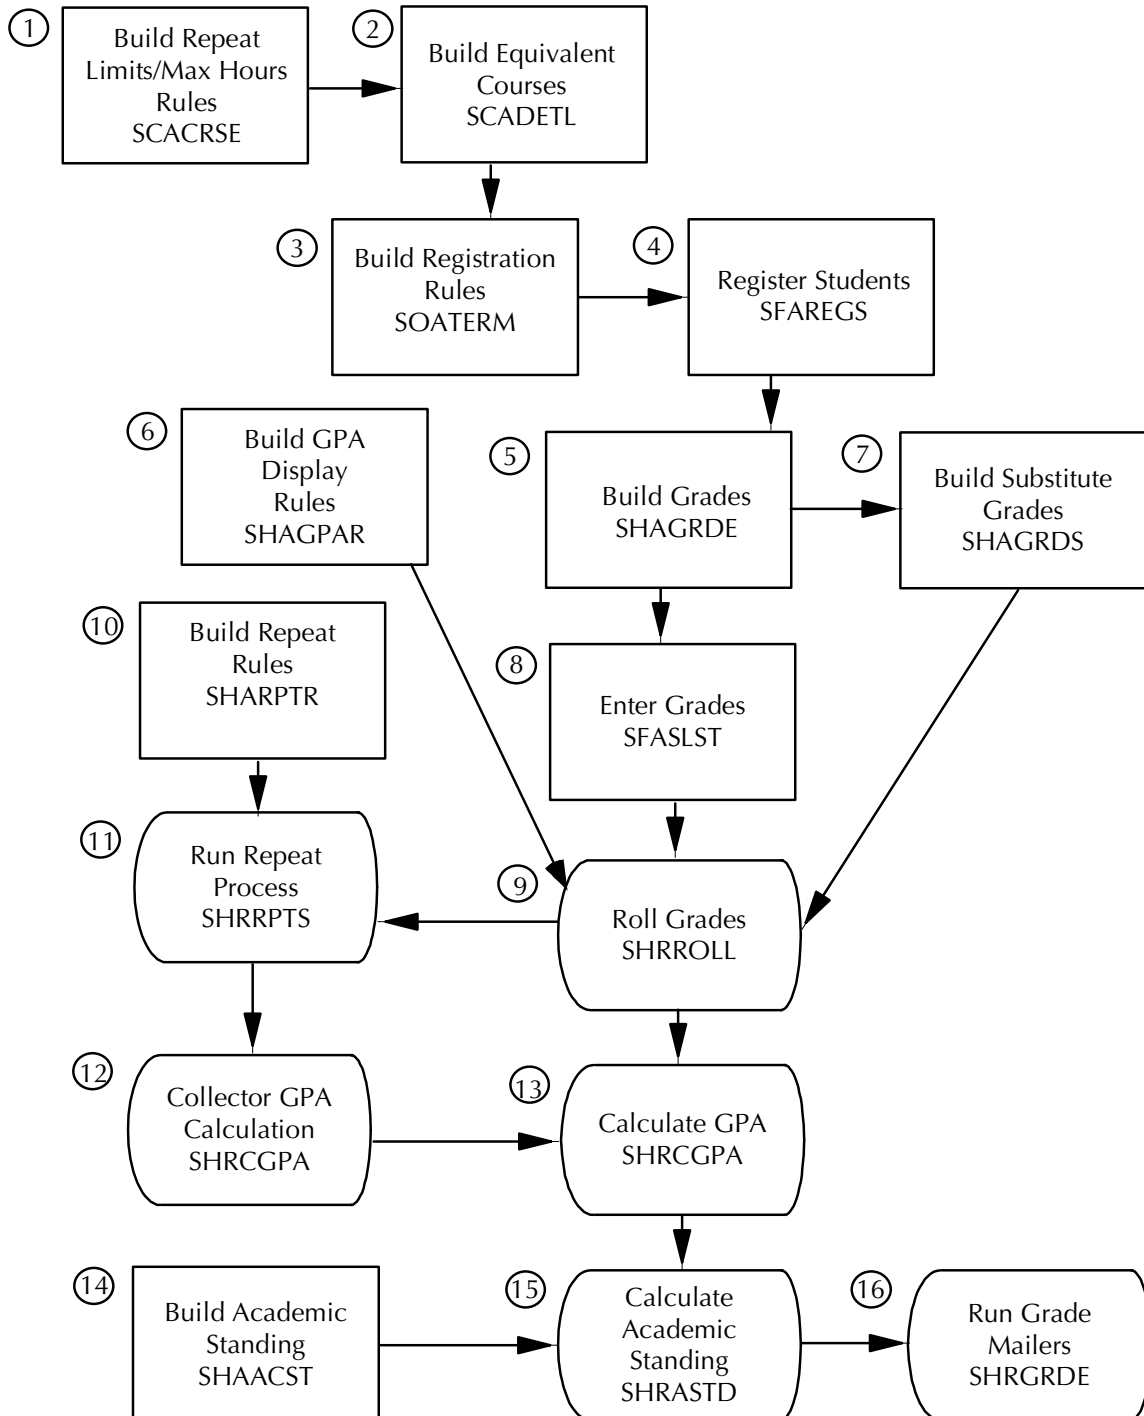

## Rule Tables Process Flow

# Return of Title IV Funds Process Flow

# Academic History Repeat Processing Flow

## Academic History Repeat Processing Flow Narrative

*The following steps should be performed at the Catalog level to activate repeat processing.*

1. Build Repeat Limit and Repeat Maximum Hours rules using the Basic Course Information Form (SCACRSE). These rules should be created for the institution's entire catalog.
2. Establish equivalent courses on the Course Detail Information Form (SCADETL). These rules should be established for all courses which have equivalents.

*The following steps should be performed at the beginning-of-term to activate repeat processing.*

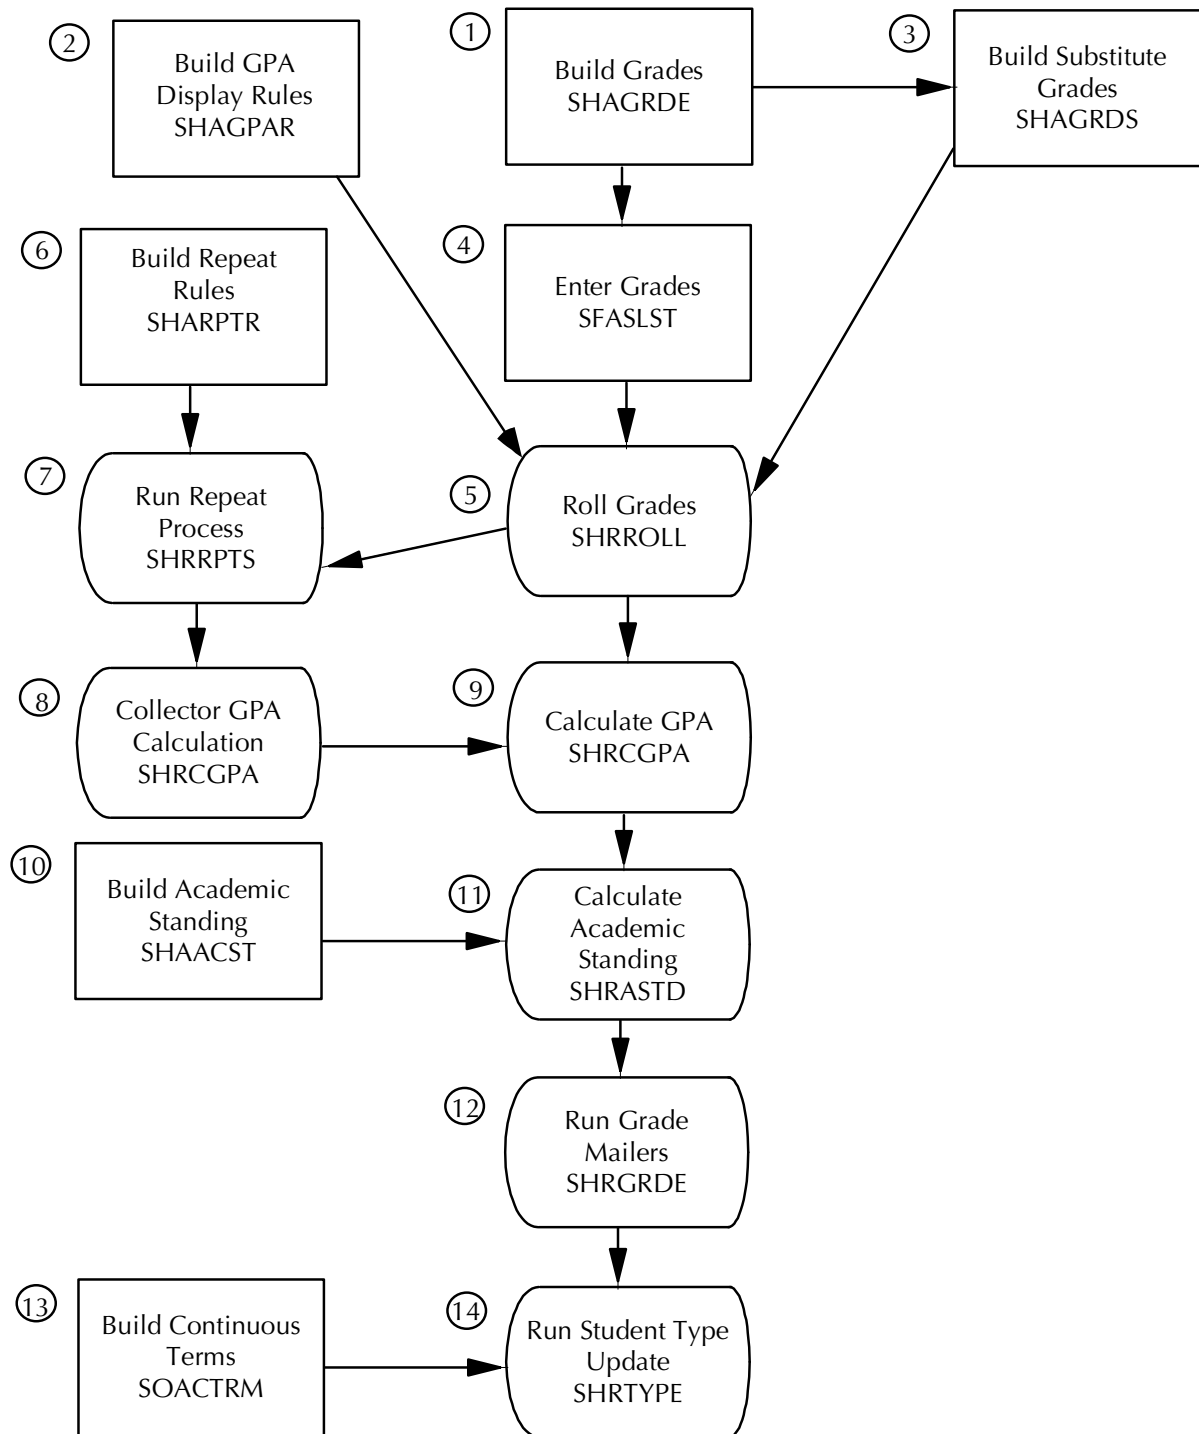

3. Build registration rules on the Term Control Form (SOATERM), and set all the flags (radio groups) on this form according to institutional policy.
4. Register students for the term on the Student Course Registration Form (SFAREGS). Override any registration errors (such as repeat errors), if desired.

*The following steps should be performed at the end-of-term to activate repeat processing.*

5. Build grades using the Grade Code Maintenance Form (SHAGRDE). The grade, including the information to determine which hours it counts in: earned, attempted, or passed, and whether it counts in the GPA, is defined on this form. Valid grading modes are also identified.
6. Build display rules using the GPA Display Rules Form (SHAGPAR). Display rules control whether GPA and quality point values will be rounded or truncated and how many digits to the right of the decimal will display in forms, on reports, and in self-service. Display rules can be built for specific course levels and/or campuses. Default display rules cause GPA and quality point values to be truncated to two digits after the decimal.
7. Build substitute grades using the Grade Code Substitution Form (SHAGRDS). For example, if a student taking a course with a pass/fail grading mode is given a B grade, that B may be substituted with a P grade.
8. Enter grades in the Class Roster Form (SFASLST).
9. Roll grades to Academic History using the Grade Roll to Academic History Process (SHRROLL), or by setting the **Rolled** check box on the Class Roster Form (SFASLST) to checked or Y and saving the change.
10. The Repeat/Multiple Course Rules Form (SHARPTR) is used to set up rules to determine what courses are considered repeats and how they will be used in the GPA calculation.

11. Run the Repeat/Equivalent Course Check Process (SHRRPTS) to flag courses that are repeated based on the rules set up on the Repeat Course Rules Form.
12. Run the Calculate GPA Process (SHRCGPA) in collector mode to re-calculate GPAs for students who took repeated courses.
13. Run the Calculate GPA Process (SHRCGPA) to calculate GPAs based on the term and the selected group of students. Groups of students can include only those whose academic histories have been rolled, or all the students for the term.
14. Academic standing rules relating to the institution's policies in probation and Dean's List are set up on the Academic Standing Rules Form (SHAACST).
15. Run the Calculate Academic Standing Process (SHRASTD) to calculate the academic standing for the selected term and group of students.
16. Produce grade mailers in batch mode by using the Grade Mailer Process (SHRGRDE). Student's grades must have either been entered manually or through the Grade Roll to Academic History Process.

# Academic History End of Term Flow

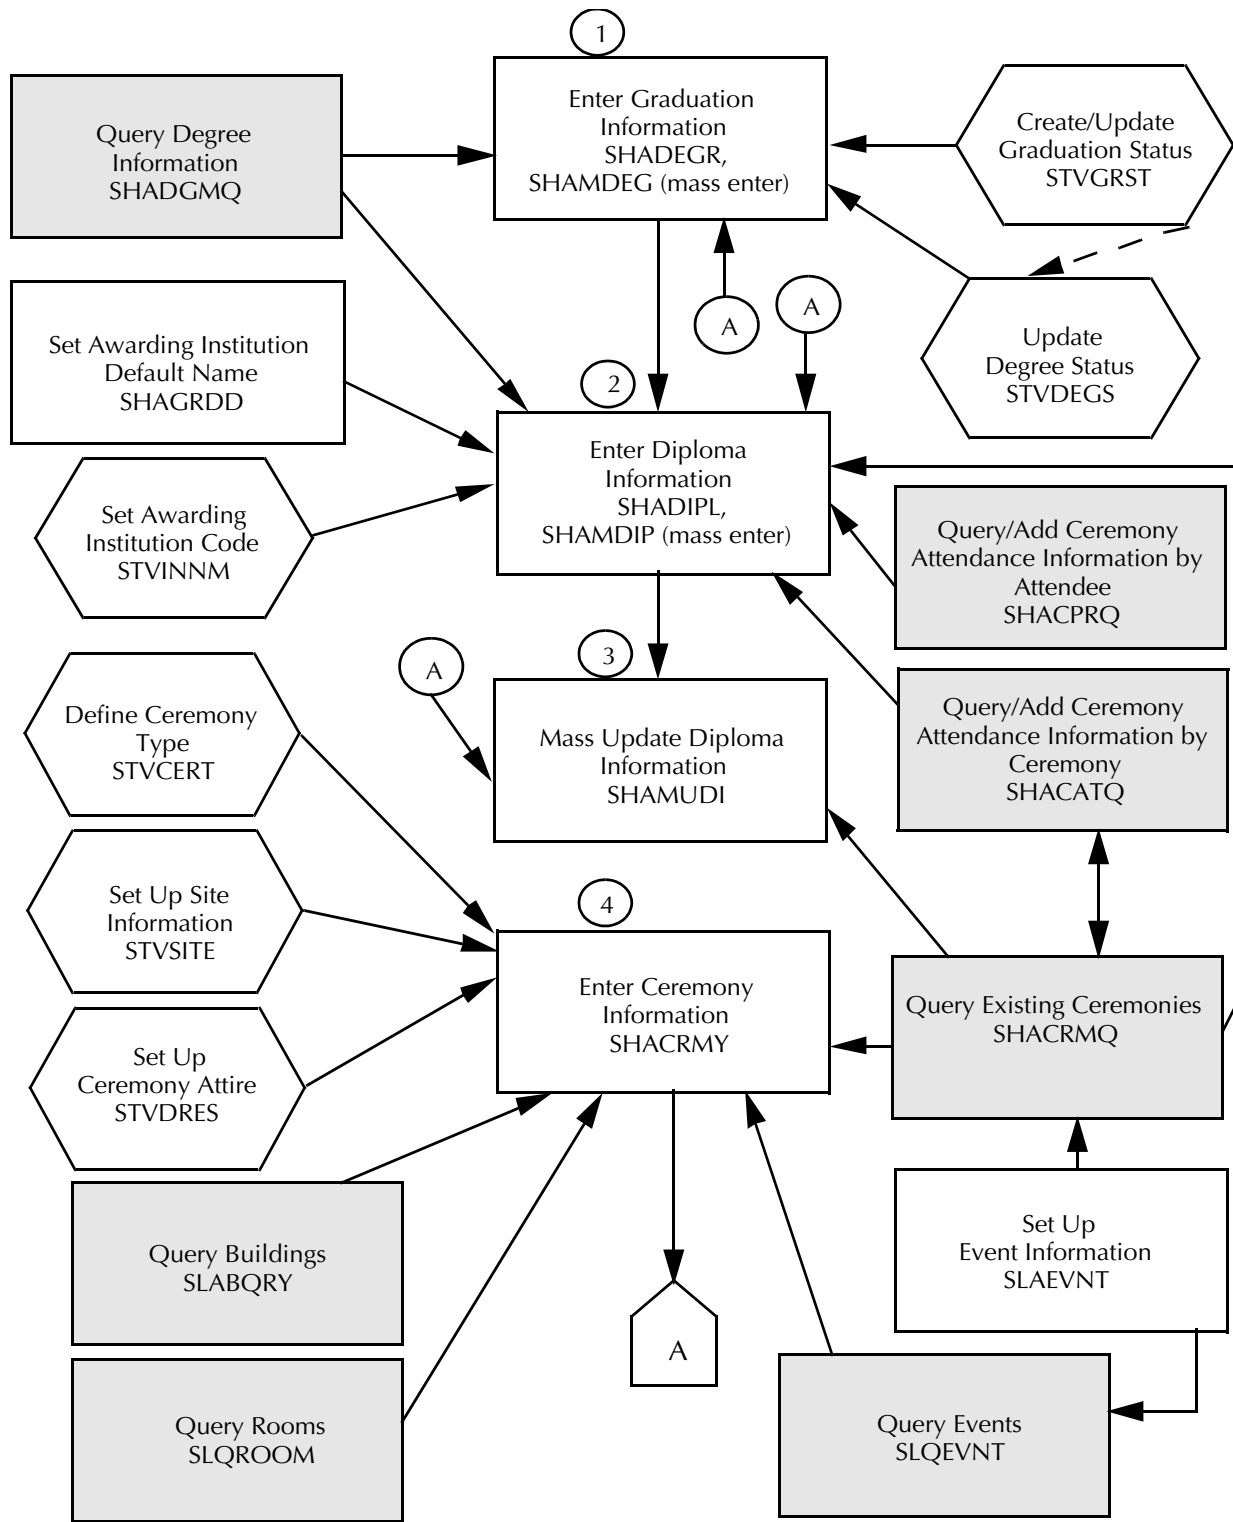

## Academic History End of Term Flow Narrative

The following steps should be performed at end-of-term.

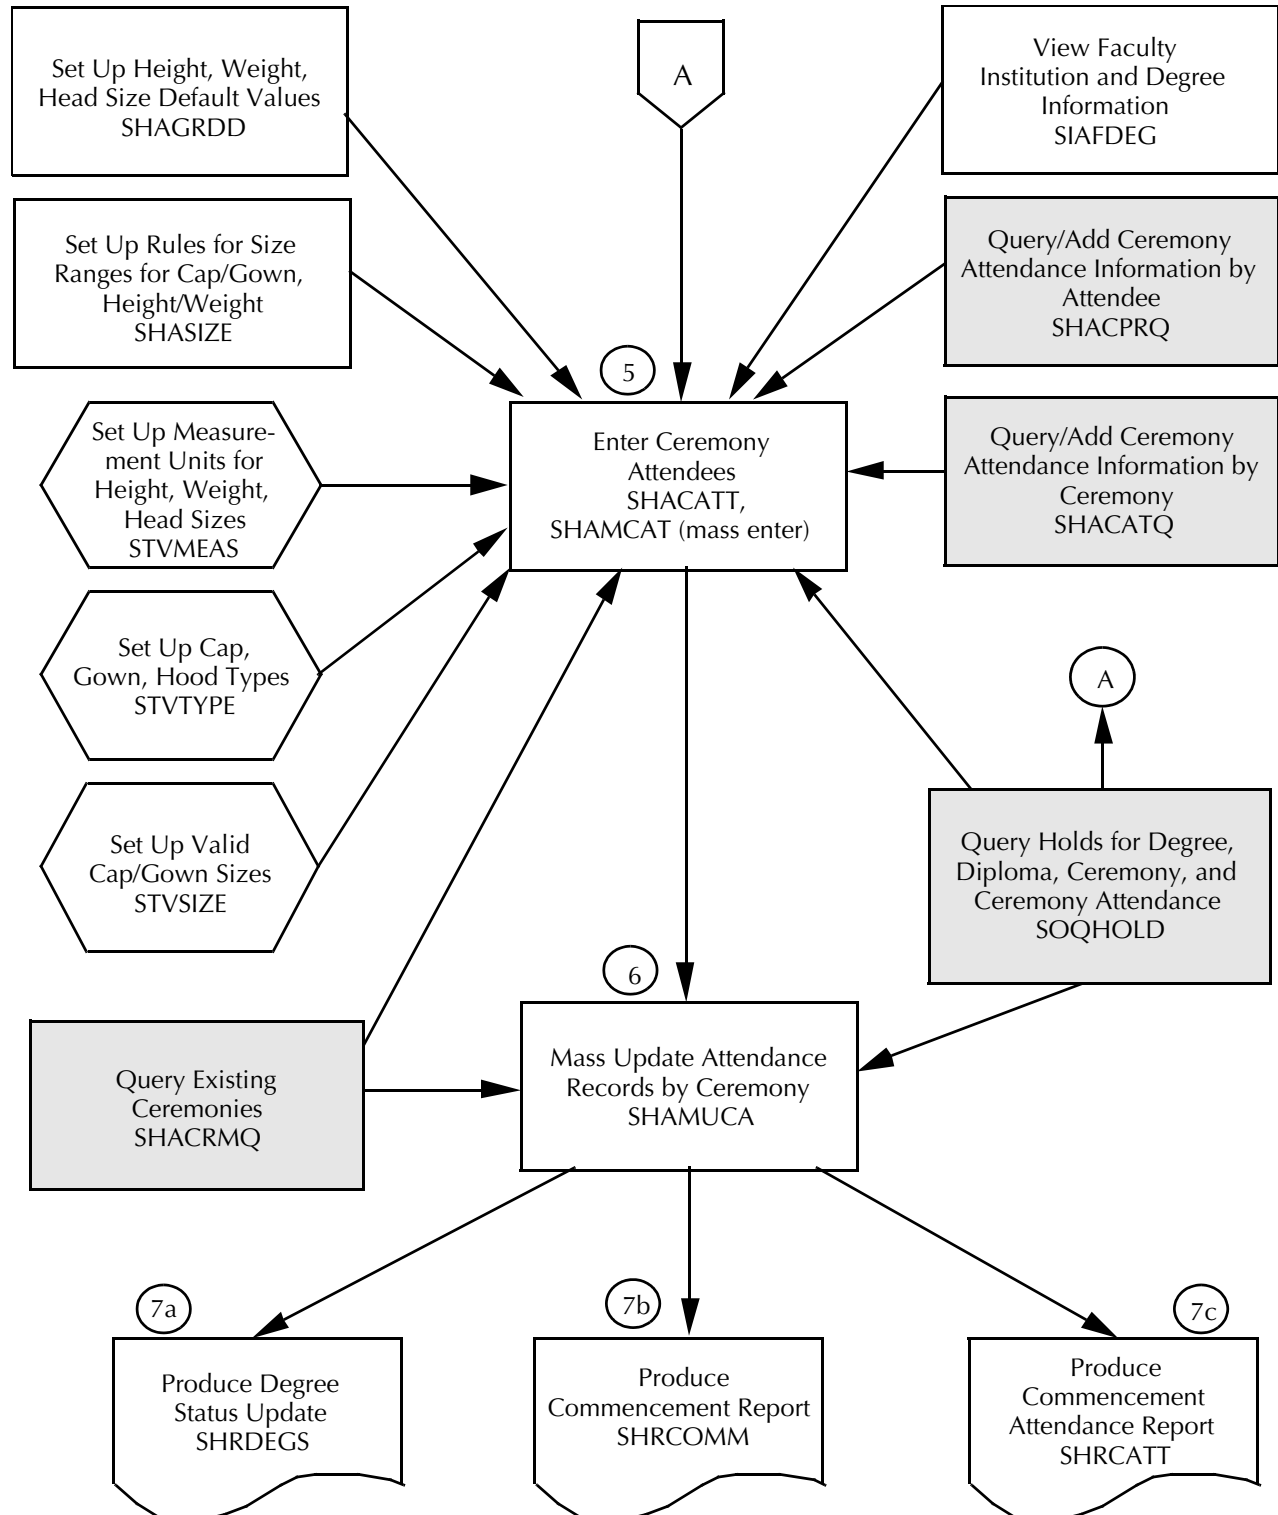

1. Build grades using the Grade Code Maintenance Form (SHAGRDE). The grade, including the information to determine which hours it counts in: earned, attempted, or passed, and whether it counts in the GPA, is defined on this form. Valid grading modes are also identified.
2. Build display rules using the GPA Display Rules Form (SHAGPAR). Display rules control whether GPA and quality point values will be rounded or truncated and how many digits to the right of the decimal will display in forms, on reports, and in self-service. Display rules can be built for specific course levels and/or campuses. Default display rules cause GPA and quality point values to be truncated to two digits after the decimal.
3. Build substitute grades using the Grade Substitution Maintenance Form (SHAGRDS). For example, if a student taking a course with a pass/fail grading mode is given a B grade, that B may be substituted with a P grade.
4. Enter grades in the Class Roster Form (SFASLST).
5. Roll grades to Academic History using the Grade Roll to Academic History Process (SHRROLL), or by setting the **Rolled** check box on the Class Roster Form (SFASLST) to checked or Y and saving the change.
6. The Repeat/Multiple Course Rules Form (SHARPTR) is used to set up rules to determine what courses are considered repeats and how they will be used in the GPA calculation.
7. Run the Repeat/Equivalent Course Check Process (SHRRPTS) to flag courses that are repeated based on the rules set up on the Repeat Course Rules Form.
8. Run the Calculate GPA Process (SHRCGPA) to re-calculate GPAs for students who took courses.
9. Run the Calculate GPA Process (SHRCGPA) to calculate GPAs based on the term and the selected group of students. Groups of students can include those whose information has been fed into a collector file, only those whose academic histories have been rolled, or all the students for the term.
10. Academic standing rules relating to the institution's policies in probation and Dean's List are set up on the Academic Standing Rules Form (SHAACST).
11. Run the Calculate Academic Standing Process (SHRASTD) to calculate the academic standing for the selected term and group of students.

12. Produce grade mailers in batch mode by using the Grade Mailer Process (SHRGRDE). Student's grades must have either been entered manually or through the Grade Roll to Academic History Process.
13. Build continuous term rules on the Continuant Terms Rule Form (SOACTRM). These rules allow you to determine which terms constitute consecutive enrollment.
14. Run the Student Type Update Process (SHRTYPE) to automatically update the student type on the general student record based on the rules created on the Continuant Terms Rule Form (SOACTRM).

# Academic History Graduation Flow

## Academic History Graduation Flow (continued)

## Academic History Graduation Flow Narrative

The following steps should be performed for graduation processing.

1. Enter graduation information (term, year, date, status, fee, etc.) for a student on the Degrees and Other Formal Awards Form (SHADEGR) or on the Mass Entry Graduation Form (SHAMDEG). The student must have a degree record on the Degrees and Other Formal Awards Form (SHADEGR) before graduation information can be entered on the Mass Entry Graduation Form (SHAMDEG).
  - Query the Degree Summary Form (SHADGMQ) to display summary information about all the degrees which a student is seeking or which have been awarded.
  - Use the Graduation Status Validation Form (STVGRST) to create and update graduation statuses which update the student's degree record.
  - If the student's degree status is to be automatically updated when the graduation status is entered or modified, it will be substituted on the Degree Status Code Validation Form (STVDEGS), and the degree record will be updated.
2. Enter diploma information (fee, name, address, awarding institution, ordered/mailed/pickup dates, ceremony, etc.) for a student on the Diploma Form (SHADIPL) or on the Mass Entry Diploma Form (SHAMDIP). The student must have a degree record on the Degrees and Other Formal Awards Form (SHADEGR) before a diploma record can be created.
  - Use the Graduation Default Control Form (SHAGRDD) to set up awarding institution default values, which are used on the Diploma Form (SHADIPL).
  - Use the Awarding Institution Validation Form (STVINNM) to create, update, insert, and delete awarding institution codes representing the school, college, or institution which is awarding the diploma.
  - Use the stand alone Ceremony Query Form (SHACRMQ) to display all existing ceremonies for an institution.
  - View the ceremony attendance information by attendee on the Ceremonies By Attendee Query Form (SHACPRQ). View the ceremony attendance information by ceremony on the Ceremony Attendance Query Form (SHACATQ).
  - Query the Degree Summary Form (SHADGMQ) to display summary information about all the degrees which a student is seeking or which have been awarded.
3. Use the Mass Update Diploma Form (SHAMUDI) to update the diploma information (ceremony, term, awarding institution, ordered/mailed/pickup dates, etc.) for a group of students without going to each individual student diploma record.

A student is not required to attend a ceremony in order to receive their diploma. If they are attending a graduation ceremony, continue through the remainder of the process.

- Use the stand alone Ceremony Query Form (SHACRMQ) to display all existing ceremonies for an institution.
4. Use the Ceremony Form (SHACRMY) to create and maintain ceremony information. There are no restrictions as to what constitutes a ceremony, although graduation is an obvious example.
- Define the ceremony types via the Ceremony Validation Form (STVCERT).
  - Define the site codes for the ceremonies on the Site Code Validation Form (STVSITE).
  - Define the dress code and type of attire on the Ceremony Dress Validation Form (STVDRES). View the ceremony attendance information by ceremony on the Ceremony Attendance Query Form (SHACATQ).
  - Use the stand alone Ceremony Query Form (SHACRMQ) to display all existing ceremonies for an institution.
  - The ceremony information may be associated with the event information in the Location Management Module by entering data in the **Event** field. If an existing event from the Event Form (SLAEVNT) is entered, event data will default in and cannot be changed on SHACRMY. If the **Event** field is left blank, the user is able to enter the event information.
  - Use the Building Query Form (SLABQRY) to display available locations for events. Use the Room Query Form to display available rooms for events. Use the Event Query Form (SLQEVNT) to display existing system scheduled events.
5. Enter the attendees for the ceremony on either the Ceremony Attendance Form (SHACATT) or the Mass Entry Ceremony Attendance Form (SHAMCAT). The person does not need to be a student to attend a ceremony. A record will exist for each unique ceremony that the attendee will attend. Attendee record information includes cap, gown, and hood, types and sizes, order, pickup, and return dates, ceremony attendance fee information, and ticket information.
- If the non-student attendee is a faculty member, use the Faculty Degree Information Form (SIAFDEG) to examine the faculty member's institution and degree information for information such as hood type to be ordered.
  - Use the Graduation Default Control Form (SHAGRDD) to set up height, weight, and head size values, which are used on the Ceremony Attendance Form (SHACATT).
  - Use the Attendee Size Classification Rules Form (SHASIZE) to create a table of sizes and ranges which is utilized by the Ceremony Attendance Form (SHACATT) to determine ceremony attendee cap or gown size, based on the attendee's height, weight, and head size. When these rules are established,

they default the appropriate cap or gown size into the Attendee Information section of SHACATT when cap and/or gown type is present.

- Use the Measurement Validation Form (STVMEAS) to indicate the valid unit of measurement for height, weight, and head size for ceremony attendees.
  - Use the Academic Dress Type Validation Form (STVTYPE) to indicate the valid types for cap, gown, and hood orders for ceremony attendees.
  - Use the Academic Dress Size Validation Form (STVSIZE) to indicate the valid size for cap and gown for ceremony attendees.
  - Use the stand alone Ceremony Query Form (SHACRMQ) to display all existing ceremonies for an institution.
  - View the ceremony attendance information by attendee on the Ceremonies By Attendee Query Form (SHACPRQ). View the ceremony attendance information by ceremony on the Ceremony Attendance Query Form (SHACATQ).
6. Use the Mass Update Ceremony Attendance Form (SHAMUCA) to perform mass updates of attendance records by ceremony for information such as: ordered, mailed, pickup, and return dates, cap type, gown type, hood type, number of tickets and diploma pickup date.
- Use the stand alone Ceremony Query Form (SHACRMQ) to display all existing ceremonies for an institution.
7. Run the necessary reports.
- 7.1. Run the Degree Status Update Report (SHRDEGS) to update the degree status and/or the student status for all those students whose current degree status is pending to awarded. The update of degree status is controlled via the parameter selected values.

For example, the user supplies the current degree status as well as the new degree status. Only those students with the current degree status will be selected for processing. Other optional selection parameters include: Graduation Term, Graduation Year, Graduation Status, Degree Code, Campus, and Level.

- 7.2. Run the Commencement Report (SHRCOMM) to produce a list of students by degree award status code, their degrees, majors, and any institutional or departmental honors associated with the degree.

A graduation date must exist in the **Graduation Date** field on the Degrees and Other Formal Awards Form (SHADEGR) in order to be included in the report. The report also includes graduation information. The parameter selections which support this include: Graduation Term Selection, Graduation Year Selection, and Graduation Status Selection.

- 7.3.** Run the Commencement Attendance Report (SHRCATT) to display the ceremony information and list those persons who are attending the ceremony. The user may request that the report also display the information on caps, gowns, and hoods, which may be used by the institution to place their orders.

The parameter selection options which may be specified include: Print only students, non-students, or all, Print the cap, gown, and hood detail, Print the cap, gown, and hood order totals, List only those persons who have no cap, gown, or hood information, List only those persons who have not picked up their order, and List only those persons who have not returned their order.

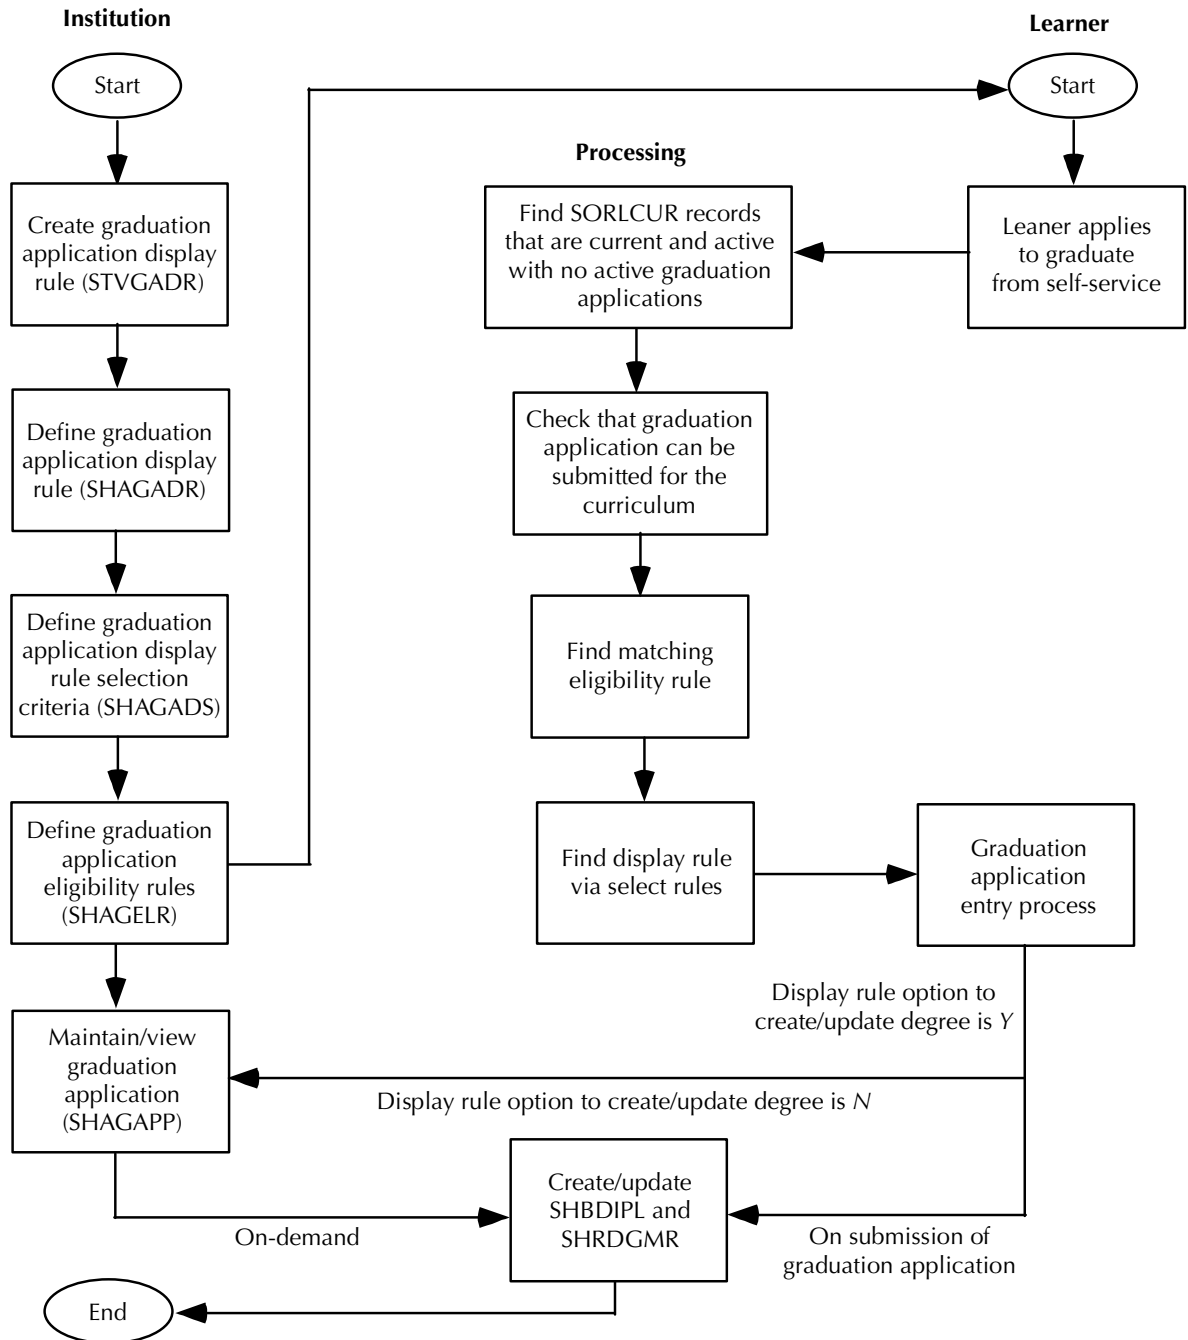

**Note**

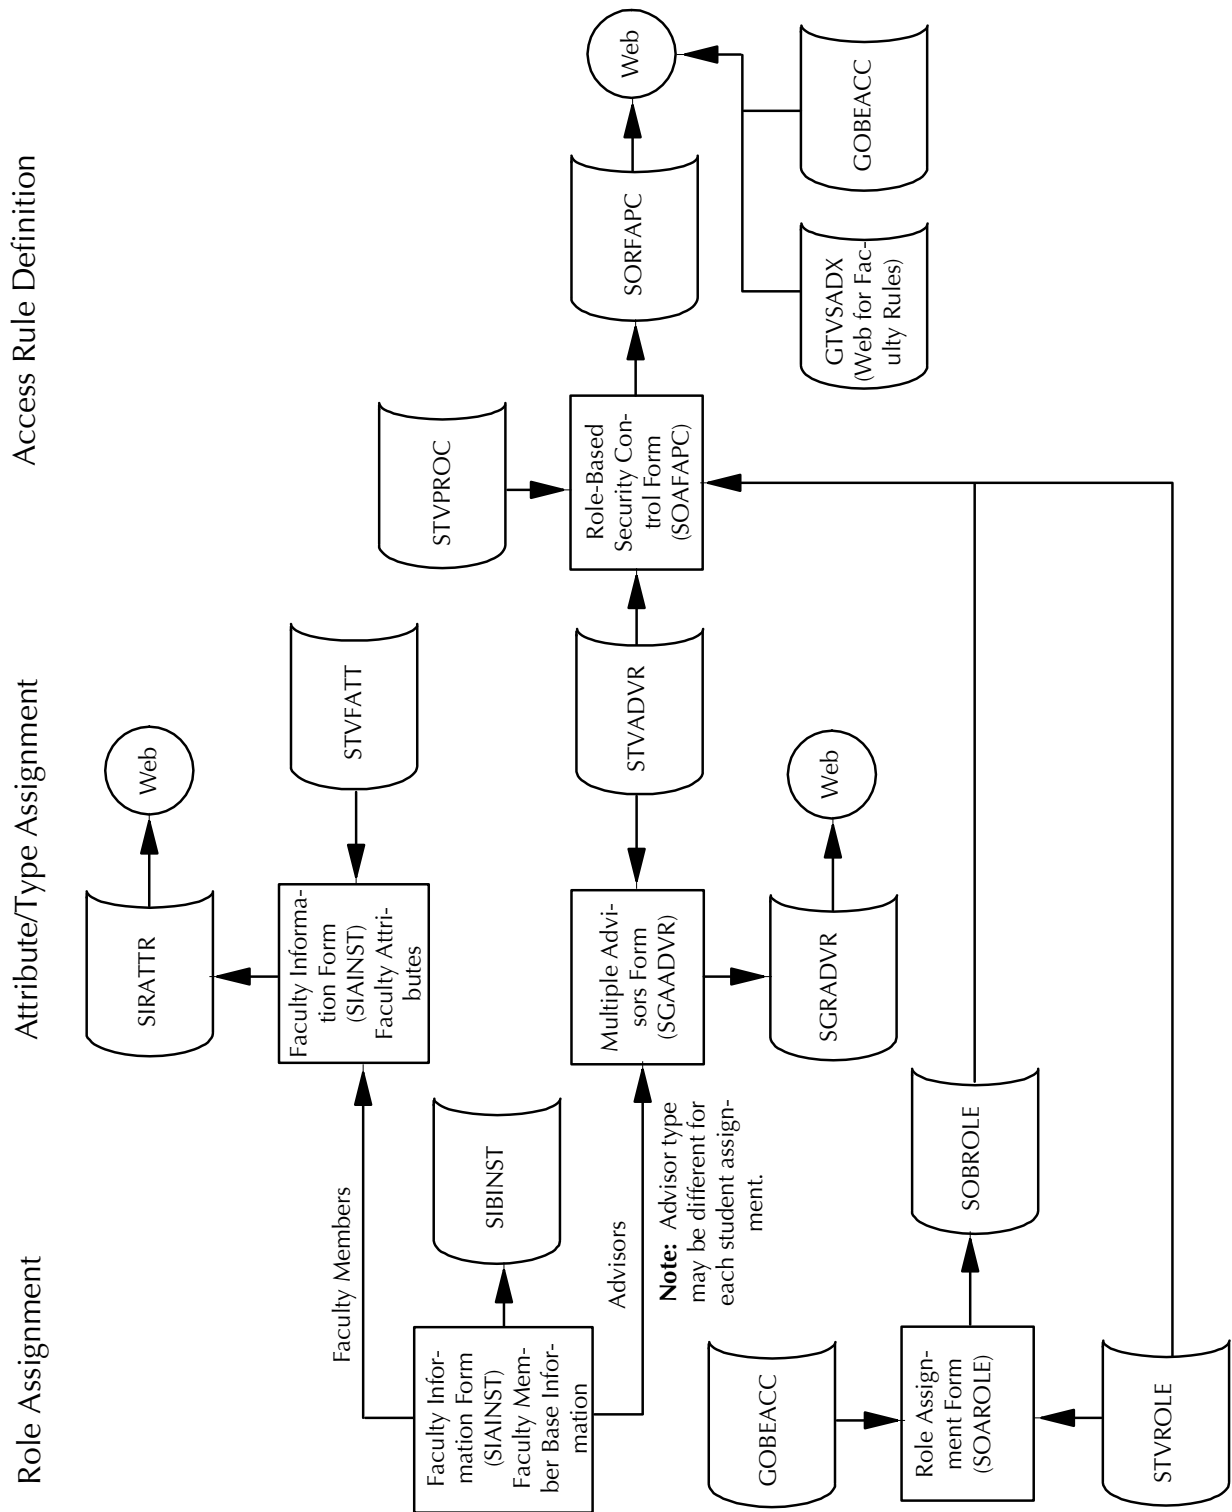

The Holds Query-Only Form (SOQHOLD) is accessed from most of the graduation forms. Hold information may be queried for students with graduation holds on their records that affect degree, diploma, ceremony, and ceremony attendance status. ■

# Graduation Application Process Flow

# Electronic Gradebook Process Flow

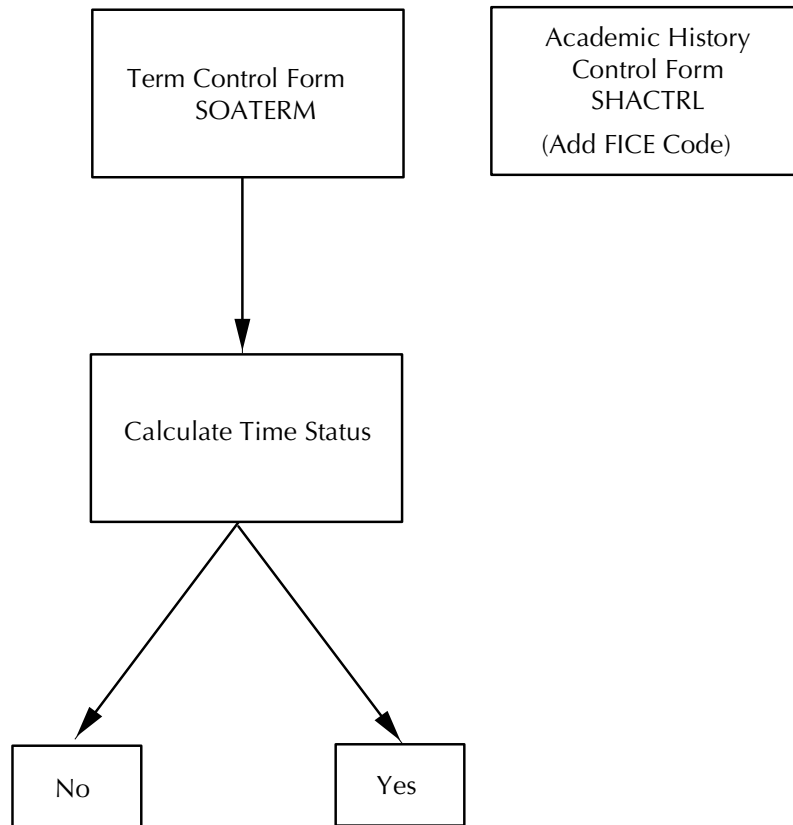

# National Student Clearinghouse (NSC) Process Flows

---

## Establish Time Status Rules and NSC Equivalencies

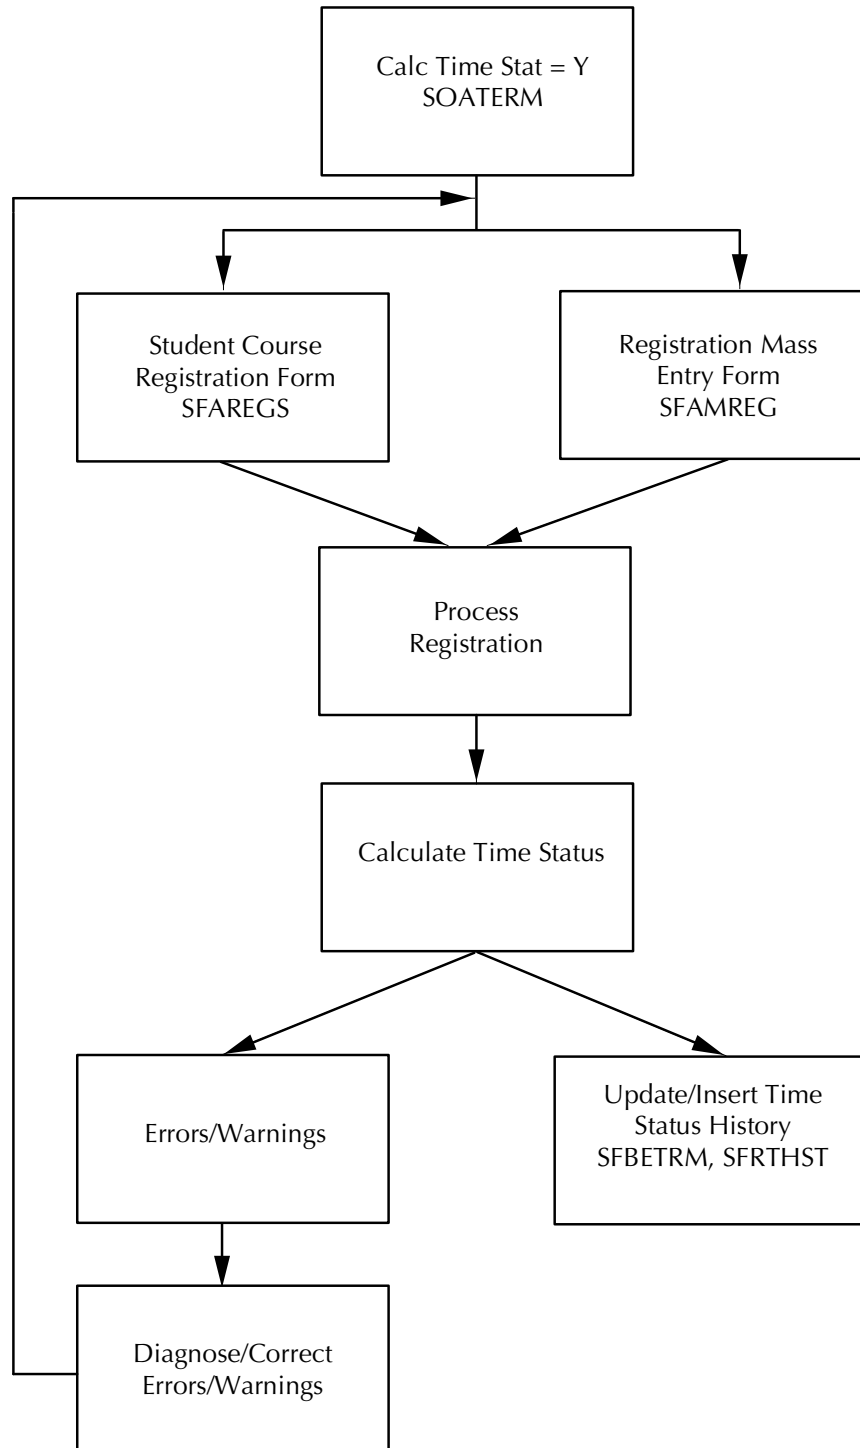

## Establish Term Control for Calculating Time Status and Academic History FICE Code Control

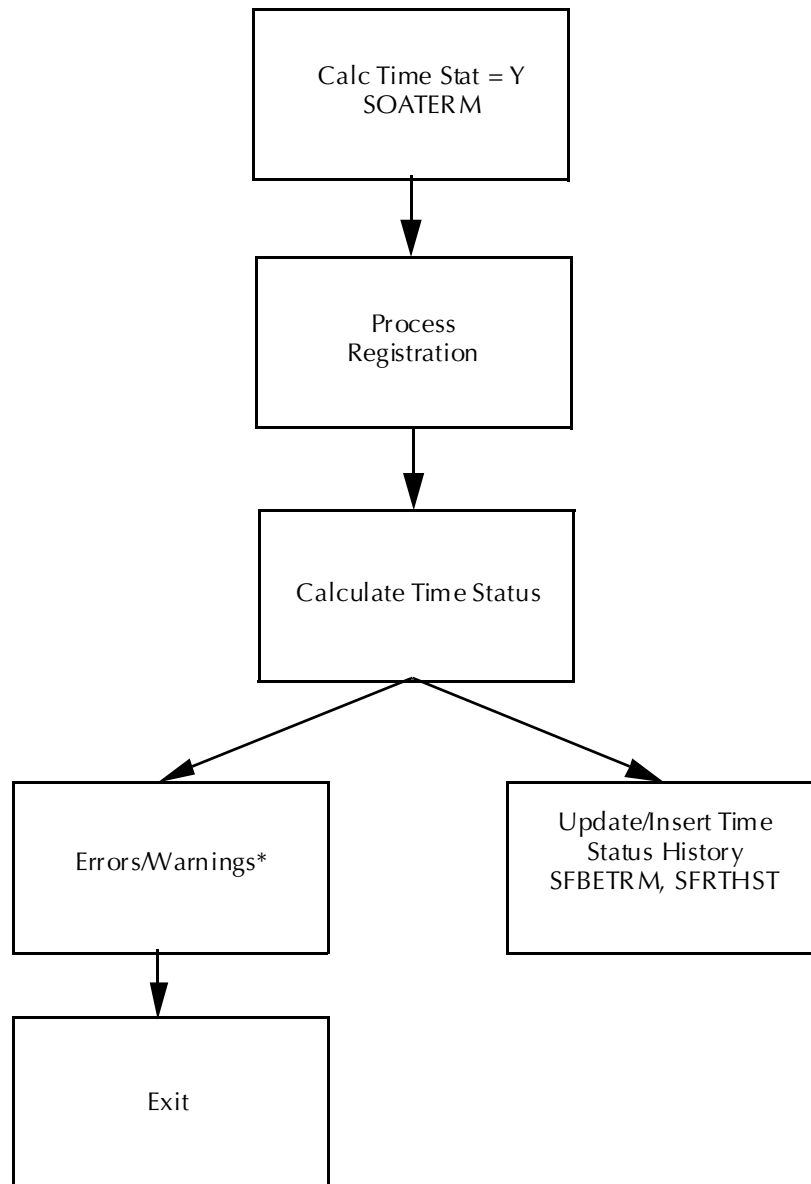

# Calculate Time Status and Update/Insert Time Status History Records

## Option 1 - Dynamic Processing - SFAREGS and SFAMREG

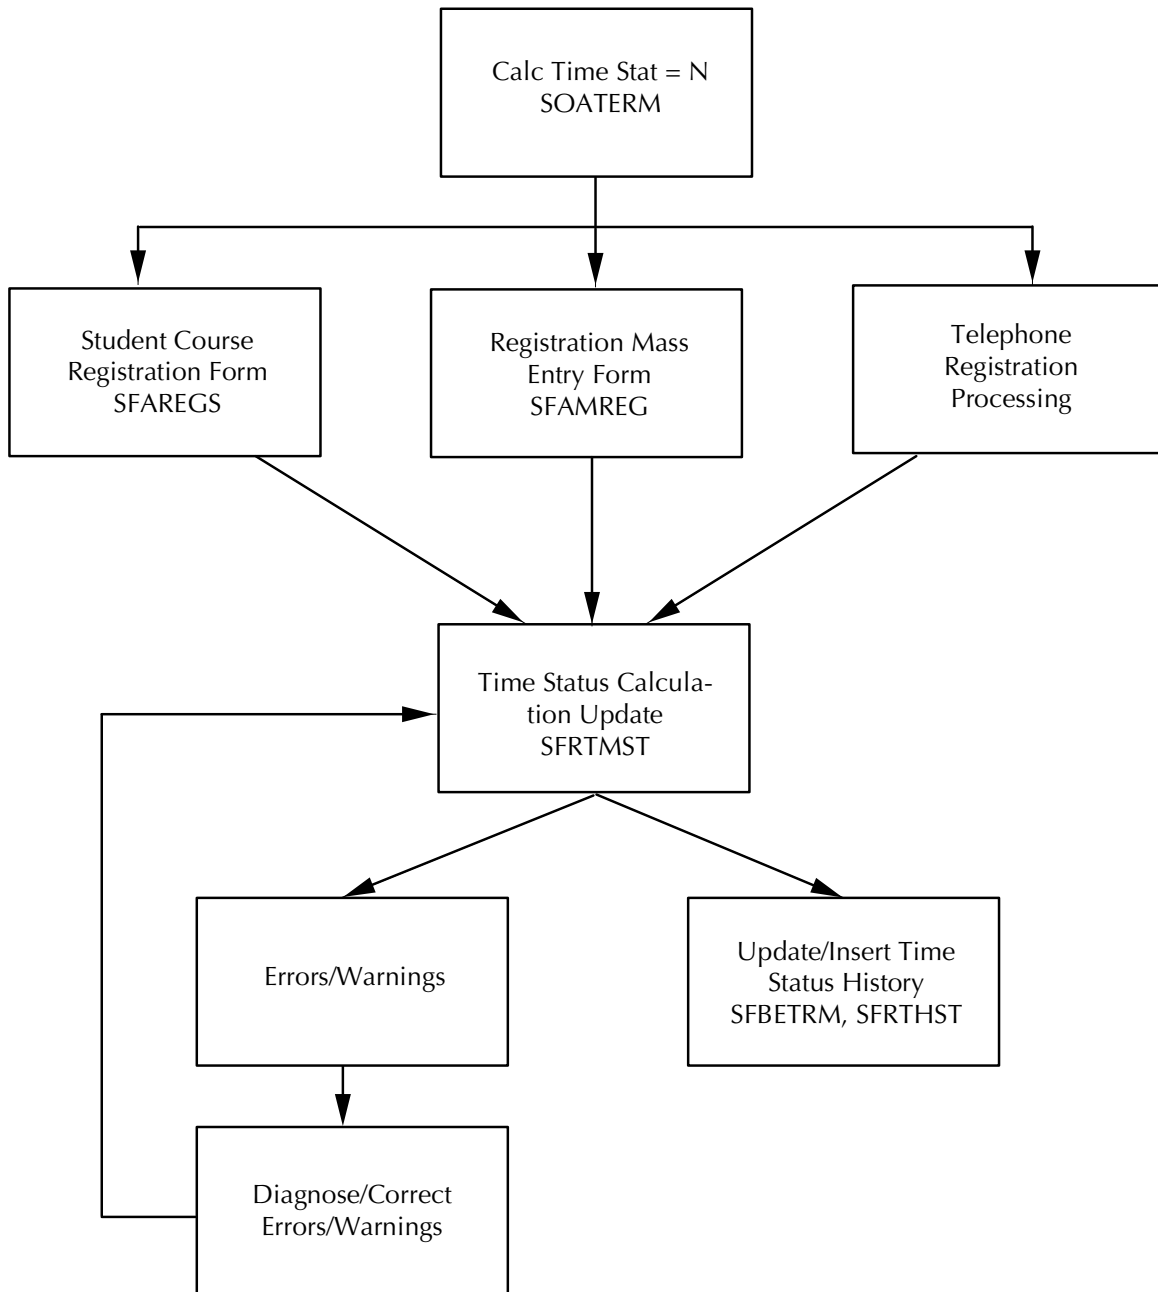

## Option 1 - Dynamic Processing - Telephone Registration Processing

\* Online display of errors/warnings related to calculation of time status is inactivated in Telephone Registration Processing. These errors/warnings can later be identified, diagnosed, and corrected by running the Clearinghouse Extract Process (SFRNSLC) in the report of missing/invalid data mode and the Time Status Calculation Update Process (SFRTMST). Additional errors not related to the calculation of time status can be identified, diagnosed, and corrected by running the Clearinghouse Extract Process (SFRNSLC) in the report of missing/invalid data mode.

## Option 2 - Batch Processing

## Option 3 - Batch Processing During Peak Registration Periods; Dynamic Processing During Off-Peak Registration Periods

Refer to the Process flows for Option 1: Dynamic Processing and Option 2: Batch Processing.

1. During peak registration activity the **Calculate Time Status** flag on SOATERM should be unchecked or set to *N*.
2. Process registration changes on all appropriate forms according to institutional policies and procedures.

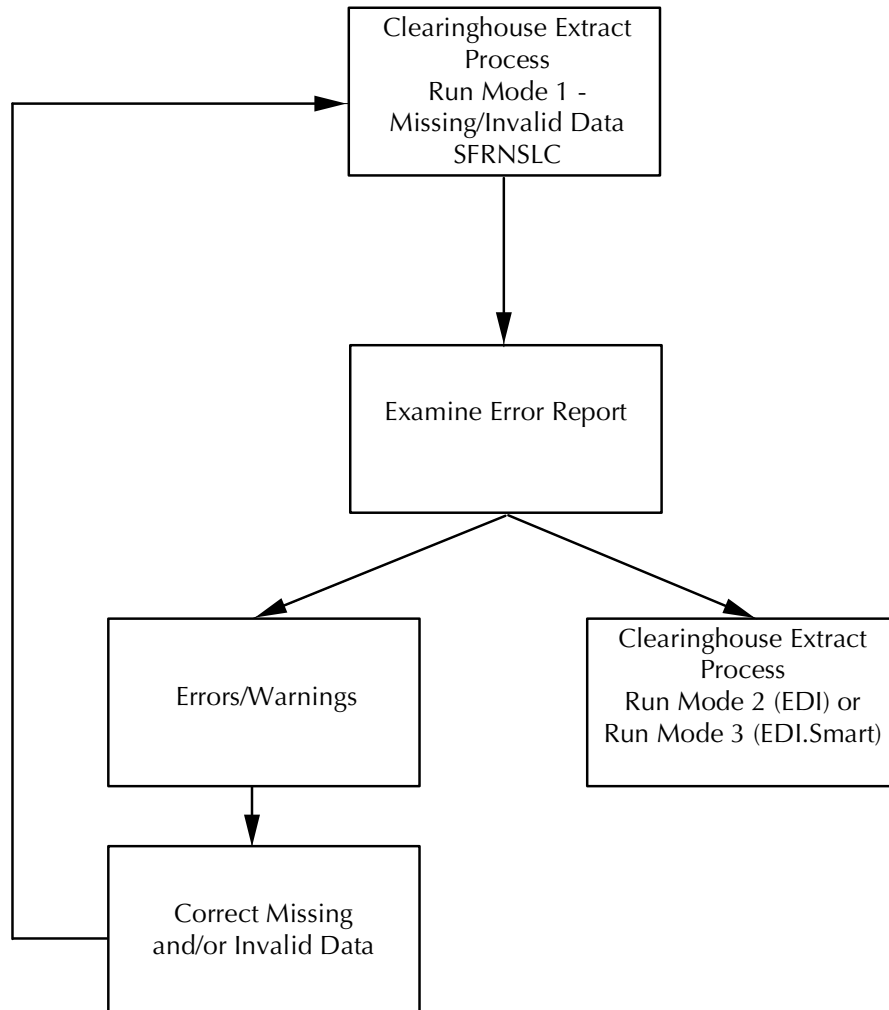

### **Note**

On SFAREGS, these changes could include updates to student information only, and not necessarily changes (add/drop/delete) of actual courses. ■

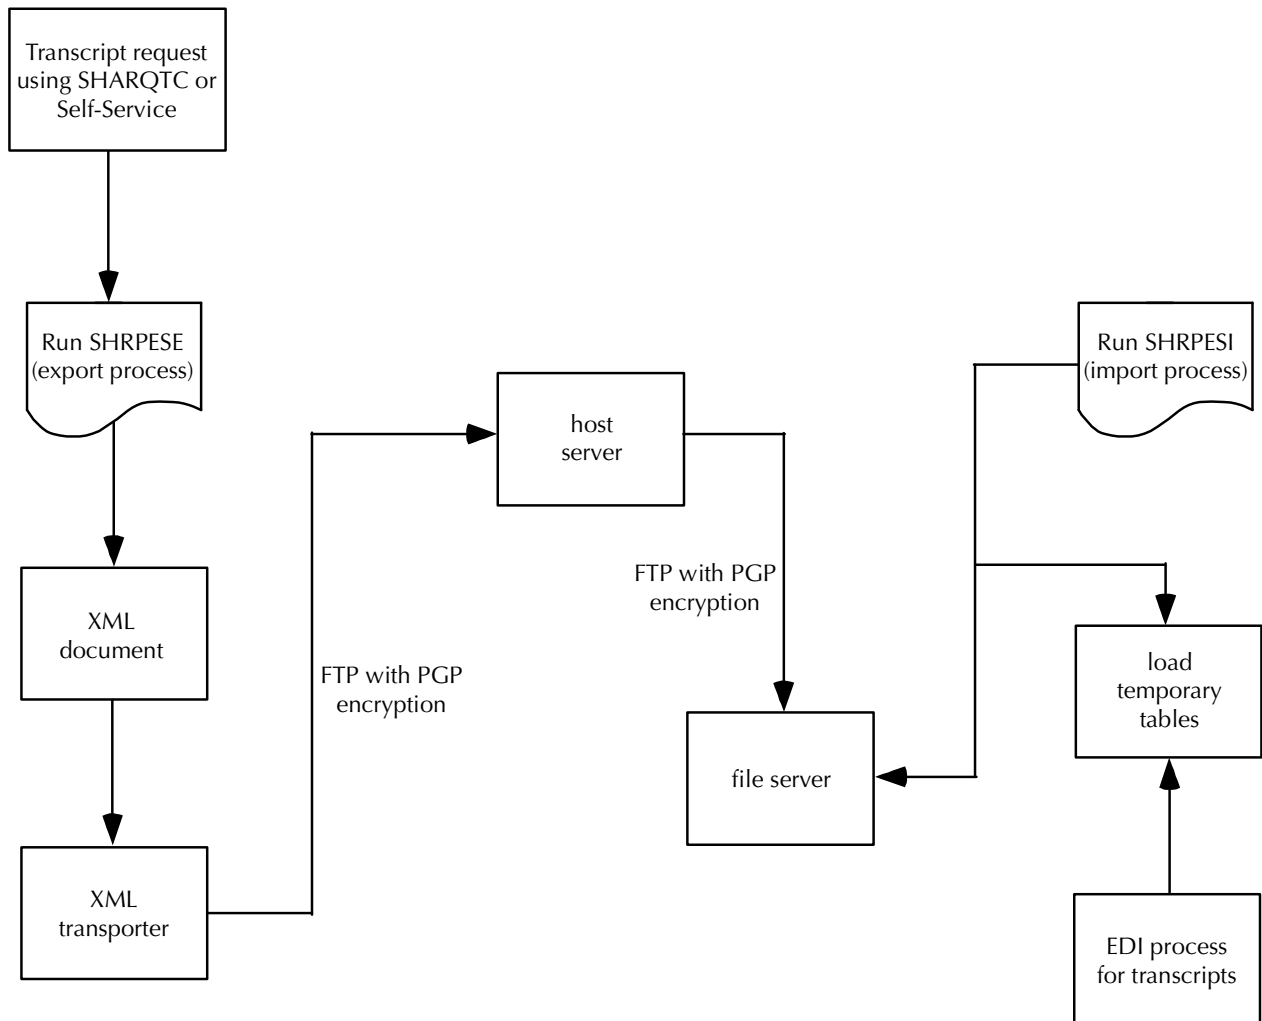

3. At the designated times, and possibly on a nightly basis, calculate time status and update/insert time status history records with the Time Status Calculation Update Process (SFRTMST). Review the report from that process for any errors or warnings, and correct those errors or warnings as needed and appropriate, and rerun SFRTMST.
4. Continue with step 2, and execute step 3 as needed and desired. The frequency of step 3 will be determined by the desired detail of student time status history changes that is required for institutional reporting and research, and required to report accurate enrollment information as of specific dates when reporting to the Clearinghouse.
5. When peak registration periods are completed, set the **Calculate Time Status** flag on SOATERM to checked or *Y*.
6. Continue processing registration changes on all appropriate forms according to institutional policies and procedures.
7. When errors or warnings are encountered in online processing in SFAREGS and SFAMREG diagnose and correct errors, if necessary. (**Note:** Diagnosis of certain errors may not occur until one or both of the batch processes have been run.)

# 4 Catalog

## Catalog Procedures

---

### Building or Changing a Course Catalog

Once you have compiled all the data you need to create a catalog for your institution, you'll need to enter it into Banner® using the Catalog module.

You use the Basic Course Information Form (SCACRSE) to enter the minimum information needed for a catalog entry:

- the course title,
- department, and
- credit hours.

You maintain any additional information concerning a course (such as corequisites, fee information, and text) on the Course Detail Information Form (SCADETL). Any changes made to the Course Catalog may be kept as a historical record.

### Course Contact Hours

The **Contact (Hours) Low** and **Contact (Hours) High** fields contain the totals of the **Lecture**, **Lab**, and **Other** fields in the Hours section of the Basic Course Information Form (SCACRSE). The default calculation may be overridden. Course contact hours high are calculated using lecture/lab/other hours low when the corresponding high hours are not entered. The first **Or/To (Hours Indicator)** entered for the **Lecture/Lab/Other Hours** fields defaults to the **Or/To (Hours Indicator)** for the **Contact (Hours)** fields.

### Open Learning Registration and Course Catalog

Open learning registration provides learners with the ability to register for a class based on start/end dates rather than a term. This date-based approach is optional and works with Banner Student's registration processing for enrollment and administrative purposes.

The differences between traditional courses and open learning courses are as follows:

- A traditional course is a part-of-term based class that is defined by and conducted within a term structure.

- An open learning course, while still contained within a term, can be any class offering where:
  - section level controls are required,
  - registration records are processed at the student level versus the class level,
  - fees are to be calculated based on the duration of the class,
  - course content delivery is other than classroom-based.

This may include but is not limited to:

- open entry/open exit classes,
- distance education classes,
- continuing education classes,
- classroom-based classes,
- independent study classes,
- practicums,
- apprenticeship classes,
- or any combination of these.

Open learning allows you to do the following in the Catalog module:

- Run reports using date ranges in place of term.
- Create a rudimentary syllabus (made up of student learning objectives, required materials for the course, and technical requirements).
- Use an expanded course title (up to 100 characters).
- Store the URL for course content.
- Search for courses based on criteria other than term.
- Use free format text to store and display course descriptions and college and/or department text.
- Specify dates when registration is accepted outside of the current parts-of-term defined on SOATERM. (For open learning courses only.)
- Define instructional methods for courses.
- Specify the duration of the course (the amount of time to be given to the student to complete the course) for the course and section levels to determine the expected course completion date for the learner.
- Create a single course for both traditional and open learning class offerings. The delivery method of the course is established when the individual section records are created.

# Set Up New Course for Traditional and Open Learning Registration

Before setting up new courses, make sure all course-related rules and validation codes have been defined in Banner.

1. Access the Basic Course Information Form (SCACRSE), and enter the subject code, course number and effective term in the Key Block.
2. Use Next Block to access the Course Information block, and enter all applicable information including course high/low hour information.
  - Check the **Continuing Education** checkbox if the course is considered as a continuing education course.
  - Enter the duration and duration units if the course could be offered as an open learning course. If the course will not be offered in an open learning format, duration is not required and will not be accepted for traditional sections.
3. Use Next Block to access the Course Level window, and add applicable course level code information. For example, if the course is considered to be a continuing education course and has been designated as such in the Course Information block, assign a level for continuing education to the course in this window.
4. Use Next Block to access the Grading Mode window, and enter applicable grading modes for the course. Make sure that one mode is designated as the default.
5. Use Next Block to access the Schedule Type window, and enter applicable schedule types for the course. The schedule type codes are entered in the **Schedule** field or selected using the List of Values from STVSCHD.

If the schedule type has been created with an attached instructional method, the instructional method will also display when the schedule type code is added. This is optional, as the schedule type/instructional method relationship can be established when creating the individual sections. It is possible to override or delete the attached instructional method.

6. Save the course. This causes the associated table entries to be created.
7. Access the Course Syllabus Form (SCASYLB) if course syllabus information (long course title, URL, learning objectives, technical requirements and/or required materials) is associated with this course for display on the Web.

## **Note**

Unlike other course default information, course syllabus information will not be displayed for the section. It is necessary to copy all or some of this information to the individual sections, as syllabus information may not be desired for all sections of the same course. The section syllabus copy process is accomplished using the **Copy** button. ■

## Update Existing Course for Open Learning Registration

Before updating existing courses, make sure all course-related rules and validation codes have been defined in Banner.

1. Access the Basic Course Information Form (SCACRSE), and enter the subject code, course number and effective term in the Key Block.
2. Use Next Block to access the Course Information block, and enter the duration and duration units for the course. This information will be used in the registration process to calculate the student's expected completion date based on the date the student elects to start the course.
3. Save the course. This causes the associated table entries to be updated.
4. Access the Course Syllabus Form (SCASYLB) if course syllabus information (long course title, URL, learning objectives, technical requirements and/or required materials) is associated with this course for display on the Web.

### Note

Unlike other course default information, course syllabus information will not be displayed for the section. It is necessary to copy all or some of this information to the individual sections, as syllabus information may not be desired for all sections of the same course. Again, the section syllabus copy process is accomplished very easily using the **Copy from Course** button. ■

## Creating a Continuing Education Catalog Entry

You enter and maintain catalog entries for CEU course offerings on the Course Information Form (SCACRSE). You must check the **Continuing Education** box to designate that this offering is only available as a CEU course.

The Course Level window can only contain valid CEU levels which have been established on the Level Code Validation Form (STVLEVL). A course cannot be both a CEU and a non-CEU course. Whenever the **Continuing Education** box changes, the **Level (Code)** field in the Course Level window is checked by the system, to insure that the levels are Continuing Education levels.

Banner automatically calculates the continuing education units associated with the CEU course offering. This is done by leaving the **CEU or Credit** field blank and entering the total contact hours associated with the course. The total contact hours will then be divided by ten to generate the CEUs.

Here is an example of the CEU calculation:

Lecture	15.00
Lab	5.00
Other	5.00
Total	25.00
System calculated CEUs:	2.5

You may override the system-calculated CEU value. Ranges of CEUs and contact hours can be maintained on CEU course offerings. Billing hours must also be specified on CEU courses. If no billing hours exist, then a zero must be entered.

## Maintaining Faculty Workload

The Schedule Type window on the Basic Course Information Form (SCACRSE) can be used to specify the faculty workload information by schedule type for each course offering. An adjusted workload which is used when the course section enrollment meets or exceeds the overload enrollment may also be specified here.

Schedule Type		Workload	Over-Enrollment	Adjusted Workload
A	Lecture	3.00	33	3.25
B	Lab	2.00	14	2.30

For any class session with a schedule type of A, the default workload for an instructor teaching the session will be 3.00. If more than 32 students are enrolled, then the workload will automatically be displayed on the Schedule Form (SSASECT) as 3.25.

## Building Registration Restrictions on Courses

After you have added a course to the system, use the Course Registration Restrictions Form (SCARRES) to build restrictions on who may register for the course.

### Note

Course and section restriction rules created prior to Release 8.0 are handled as follows. The **(Field of Study) Type** field on SCARRES and SSARRES will be set to a default of *MAJOR* when a current course or section restriction rule exists for a major (STVMAJR). Since only the field of study type of *MAJOR* was previously considered, all registration restriction rules will function as before. Processing checks the primary and secondary curriculum elements. ■

You may restrict a course to include or exclude students specifically by:

- department,
- field of study (major),
- class,
- level,
- degree,
- program,
- campus,
- college,
- student attribute, and
- cohort.

The restriction controls are used to enter and maintain the restriction indicators associated with the restrictions for a course. The only values that can be selected in the **Include Exclude** radio groups are *Include* for include restrictions and *Exclude* for exclude restrictions. An inclusion restriction means a course may be offered only for the values displayed for that restriction. An exclusion restriction prohibits the offering of a course for the specified restrictions.

To end restrictions:

- Select the **Maintenance** button and choose the End Restrictions option, or use Duplicate Item from that restriction section (such as Department Restriction), and those restrictions are ended for the term in the Key Information.

To modify restrictions:

- Select the **Maintenance** button and choose the Copy Restrictions option, or use Duplicate Record from the appropriate section to create a new effective term record for the term in the Key Information. This new effective term record may be modified at the your discretion.

## Campus Restrictions

Use the Campus Restriction section of the Course Registration Restriction Form (SCARRES) to create rules to restrict registration of a course by campus. The course may be included or excluded to a single campus or a group of campuses. These campus restriction rules function in the same manner as the class and level restrictions which exist on the form.

An inclusion restriction indicates that registration for the course is only permitted for those students whose campus value equals the campuses in the Campus Restriction section. An

exclusion restriction prohibits the registration of the course for those students whose campus value equals the campus in the Campus Restriction section.

For example, AUTO 123 has a campus registration restriction rule to include campus 1. This means that only those students whose campus value is equal to 1 in the Student Information window on the Student Course Registration Form (SFAREGS) will be able to register for the course.

The course MATH 500 has a campus registration restriction rule to exclude campus 2 and campus 3. This means that a student whose campus value is equal to either 2 or 3 will be prevented from registering for the course.

These campus restrictions default to the schedule information and are maintained on the Schedule Restrictions Form (SSARRES). Additional restrictions may then be added or modified at the section via the Schedule Restrictions Form (SSARRES). The campus restriction checking is controlled by a the **Campus (Restriction Severity)** registration error flag on the Term Control Form (SOATERM).

## Test Score and Prerequisite Restrictions

You may also restrict courses by test score restrictions and prerequisites. Use the Catalog Prerequisite and Test Score Restrictions Form (SCAPREQ) to set up course test score and prerequisite restrictions and course area prerequisite restrictions. Use the Schedule Prerequisite and Test Score Restrictions Form (SSAPREQ) to set up section test score and prerequisite restrictions and section area prerequisite restrictions.

The combined prerequisite and test score restriction processing enables you to establish specific tests and minimum scores, courses and minimum grades, or combinations of these which must be attained prior to registering for the course.

You may specify multiple conditions using the AND (A) and OR (O) connectors along with parentheses. For test restrictions, **Test Code** and **Test Score** are required. For basic prerequisite checking, **Subject** and **Course** are required. If grade checking is to be performed for a subject and course, then **Grade** and **Level** are also required. Grade checking will check for the numeric value on the Grade Code Maintenance Form (SHAGRDE). If a student is permitted to take a course and the prerequisite for the course in the same term, the flag in the **Concurrency** field should be set to *Yes* from the pull-down list.

Restrictions and prerequisites set at the course level on the Course Registration Restrictions Form (SCARRES) and the Catalog Prerequisite and Test Score Restrictions Form (SCAPREQ) will default to the schedule information and are maintained on the Schedule Restrictions Form (SSARRES) and the Schedule Prerequisite and Test Score Restrictions Form (SSAPREQ) respectively. These restrictions and prerequisites may then be added to or modified for the section via SSARRES and SSAPREQ.

Test score and prerequisite restrictions are examined on the Student Course Registration Form (SFAREGS) when the student attempts to register for the course. This restriction

checking is controlled by the **Prerequisites (Course Severity)** radio group on the Term Control Form (SOATERM).

The student's test information must be maintained on the Test Score Information Form (SOATEST). Prerequisite course restrictions will automatically check graded courses in registration, academic history, and transfer work. The student's same term registration will only be checked if the **Concurrency (Indicator)** on SCAPREQ or SSAPREQ is set to *Yes* for the course being checked.

 **Note**

Ungraded courses in registration will be unchecked and will generate an *In Progress* error in registration. This error is different from the *Not Satisfied* error. ■

**Example:**

The following is an example of a test score and prerequisite restriction.

- Math 400 requires a student to have taken the SAT math test and have received a minimum score of 500.
- Or, they must have successfully completed Math 300.
- Or, they must have received a minimum score of 425 on the math SAT and completed Math 200 at the undergraduate level and received a grade of A.

These restrictions would be set up as follows:

TEST (Code, Score) and PREREQUISITE (Subject, Course, Level, Grade, and Concurrency)

A/O	'('	Code	Score	Subj	Crse	Level	Grade	Concurrency	)'
	(	S01	500						)
O	(			MATH	300				)
O	(	S01	425						)
A				MATH	200	01	A		)

 **Note**

Level 01 is undergraduate, and Test Code S01 is SAT math. ■

If the **Prerequisites (Course Severity)** radio group on SOATERM is set to check these restrictions, and the student attempts to register for Math 400, the student's test information on SOATEST, as well as the student's academic history and transfer course work, are examined to see if the student meets any of the three requirements. If the student does meet the required restrictions, then the registration will be processed. If none of these restrictions are met, then an error message is generated on SFAREGS, and an override may be performed.

**Example:**

The following is an example using stacked parentheses to create prerequisite restrictions on SCAPREQ and SSAPREQ.

This example assumes a prerequisite of ((ENGL 101 or ENGL 102) AND (ENGL 103 or ENGL 104)) OR (LITR 101 and LITR 103).

- The student must have successfully completed ENGL 101 or 102 with a grade of C AND ENGL 103 or ENGL 104 with a grade of C.

OR

- The student must have successfully completed LITR 101 and LITR 103 with a grade of C.

These restrictions would be set up as follows:

TEST (Code, Score) and PREREQUISITE (Subject, Course, Level, Grade, and Concurrency)

A/O	'('	Code	Score	Subj	Crse	Level	Grade	Concurrency	')
	(								
	(			ENGL	101		C		
O				ENGL	102		C		)
A	(			ENGL	103		C		
O				ENGL	104		C		)
									)
O	(			LITR	101		C		
A				LITR	103		C		)

Test score and prerequisite restrictions are edited by an SQL Editor that parses the entered data in the same format used to apply the restrictions within the registration process. This allows you to know immediately if the syntax of the statement you created will be executable and so prevents possible prerequisite execution errors.

## Using All Field of Study Types with Restrictions

The **All Field of Study Types** checkbox on SCARRES and SSARRES is used to indicate whether all field of study types should be considered for the field of study code entered.

When this field *is* checked, a field of study code must be entered in the **(Field of Study) Code** field to activate the restriction rule. A message is displayed that the rule cannot be saved without a field of study code. All field of study types (*MAJOR, MINOR, CONCENTRATION*, and so on) will be considered for any field of study codes that are entered. You cannot enter a specific field of study type in the **Type** field when the **All Field of Study Types** checkbox is checked. The user is taken to the **Code** field to select the field of study value.

When the checkbox is *not* checked, you can access the **Type** field and enter field of study types. Multiple field of study type rules can exist, but they must be unique. At least one field of study code must be entered in the **(Field of Study) Code** field to activate the restriction rule. Once a field of study type rule exists, the **All Field of Study Types** checkbox is not accessible.

You can either check the **All Field of Study Types** checkbox, or enter one or more values in **(Field of Study) Type field**, but you cannot do both. If you enter more than one value in **(Field of Study) Type field** (*MAJOR, MINOR, CONCENTRATION*, and so on) you must set the **Include Exclude** radio group for each type. (Each field of study is independently included or excluded.)

## Using Field of Study Type Codes with Restrictions

The **(Field of Study) Type** field displays the learner field of study type code and the associated description from GTVLFST, such as *MAJOR, MINOR, CONCENTRATION*. When a field of study type is entered in the **Type** field, a field of study code must also be entered in the **(Field of Study) Code** field to activate the restriction rule. A message is displayed that the rule cannot be saved without a field of study code. The field of study type for the code entered will be checked during processing. When a field of study type exists in the **Type** field, you cannot access the **All Field of Study Types** checkbox.

The field of study type (in the **Type** field) is associated with the **Include Exclude** radio group. Multiple field of study codes can be included in or excluded from the rule for each particular field of study type. When a field of study type is selected, a field of study code must exist. Only one inclusion or exclusion can exist per field of study type.

Include and exclude options can be modified at any time on SCARRES for any valid, active, field of study type restriction rule when the header term is equal to the from term for the rule. A rule with an existing field of study type allows you to add a new, unique, field of study type rule. Otherwise, the **Maintenance** button must be used to end or copy the rule. Once a field of study rule has been saved, the field of study type cannot be changed.

### Example 1:

Valid Rule: One include/exclude rule per field of study type allowed.

Include/Exclude	Field of Study Type	Field of Study Code
Include	MINOR	MATH
		SPAN
		CHEM
Exclude	CONCENTRATION	ENGL
Include	CERTIFICATE	YOGA

**Example 2:**

Valid Rule: One include/exclude rule per field of study type allowed.

<b>Include/Exclude</b>	<b>Field of Study Type</b>	<b>Field of Study Code</b>
Include	MINOR	MATH ENGL

**Example 3:**

Invalid Rule: Multiple include/exclude rules per field of study type not allowed.

<b>Include/Exclude</b>	<b>Field of Study Type</b>	<b>Field of Study Code</b>
Include	MAJOR	MATH
Exclude	MAJOR	ENGL

**Example 4:**

Valid Rule: One include/exclude rule when **All Field of Study Types** is checked allowed.

<b>Include/Exclude</b>	<b>Field of Study Type</b>	<b>Field of Study Code</b>
Include	<b>All Field of Study Types</b> checked (set to Y)	MATH ENGL SPAN

or

<b>Include/Exclude</b>	<b>Field of Study Type</b>	<b>Field of Study Code</b>
Exclude	<b>All Field of Study Types</b> checked (set to Y)	MATH ENGL SPAN

**Example 5:**

Invalid Rule: Only one rule can exist when **All Field of Study Types** is checked. The **Type** field rule (*MAJOR*) cannot be created at the same time. (The **Type** field is not available for data entry when the **All Field of Study Types** field is checked.)

<b>Include/Exclude</b>	<b>Field of Study Type</b>	<b>Field of Study Code</b>
Include	<b>All Field of Study Types</b> checked (set to Y)	MATH ENGL SPAN
Exclude	MAJOR	BUSI

## Sample Rules for Field of Study Codes and Types

Here are some rules for how field of study codes and field of study types can be used with restriction rules.

- When the **(Field of Study) Type** field is null and the **All Field of Study Types** checkbox is checked, all field of study types (*MAJOR*, *MINOR*, *CONCENTRATION*, and so on) are considered for the entered field of study codes.
- When the **(Field of Study) Type** field is not-null, the **All Field of Study Types** checkbox cannot be checked, and the specific field of study type entered in the **Type** field will be considered for the field of study codes that are entered.
- When the **All Field of Study Types** checkbox is unchecked, the **(Field of Study) Type** field is null, and the **(Field of Study) Code** field is null, no field of study restriction rule exists.
- Only a single field of study rule can exist when the **All Field of Study Types** checkbox is checked. However, multiple field of study codes can be entered.
- Multiple, active field of study type rules can be created (*MAJOR*, *MINOR*, *CONCENTRATION*), as long as each field of study type that is entered is unique.

The **Field of Study** severity flag on SOATERM is used with registration error checking. Although any number of field of study type restrictions can exist on a section restriction rule (*MAJOR*, *MINOR*, *CONCENTRATION*, and so on), there is only one registration override flag associated with field of study. This means that when one field of study restriction is overridden during registration processing, no further registration error checking will be performed on any remaining fields of study.

### **Example:**

On SSARRES, CRN 10012 has multiple field of study restrictions for *MINOR*, *CONCENTRATION*, AND *CERTIFICATE*.

On SOATERM the **Field of Study** error checking is set to *FATAL*.

On SFAREGS, a student registers for the CRN and does not meet any of the multiple field of study restrictions. The first restriction that is encountered appears as a fatal error.

```
10112    ART    311    Field of Study Restriction - .000    400.000    RE    UG
                               CONCENTRATION
```

If the operator overrides the *CONCENTRATION* error, no further error checking is performed for field of study restrictions on this course for this student.

## Ending Field of Study Type Rules

Each field of study restriction rule must be ended independently on SCARRES. If multiple rules exist and the **Maintenance** button is used to end a restriction, only the field of study type in context is ended.

### **Example:**

Field of study type rules exist for *CONCENTRATION*, *MAJOR*, and *MINOR*. Only the *MAJOR* rule is to be ended. Scroll through **(Field of Study) Type** rules until *MAJOR* is displayed, and use the **Maintenance** button to end the restriction. Only the *MAJOR* restriction is ended. The *CONCENTRATION* and *MINOR* restrictions remain active.

If only one rule exists, whether it is a field of study type (such as *MAJOR*) or all field of study types (per the **All Field of Study Types** checkbox), that rule can be ended as well by using the **Maintenance** button.

## Building Schedule Restrictions on Courses

After you have added a course to the system, you can use the Catalog Schedule Restrictions Form (SCASRES) to build restrictions on when sections can be created for a course. You may restrict courses that are used on the Schedule Form (SSASECT) by including or excluding courses for specific terms or campuses.

The term restriction control is used to enter and maintain the restriction indicator associated with the term restrictions for a course. The only values that can be selected in the **Include Exclude** radio group are *Include* for include restrictions and *Exclude* for exclude restrictions. An inclusion restriction means a course may be offered only for the terms displayed in the Term Restriction section of the form. An exclusion restriction prohibits the offering of a course for the specified terms.

The campus restriction control is used to enter and maintain the restriction indicator associated with the campus restrictions for a course. The only values that can be entered in the **Include Exclude** radio group are *Include* for include restrictions and *Exclude* for exclude restrictions. An inclusion restriction means a course may be offered only for the campuses displayed in the Campus Restriction section of the form. An exclusion restriction prohibits the offering of a course for the specified campuses.

## Mutually Exclusive Courses

Institutions can track courses that are similar to other courses in content but are not considered to be equivalent courses. These courses can be defined in Banner at the catalog level as mutually exclusive courses. Students who have taken courses in this category can be prevented from registering for other associated courses. This functionality builds on existing equivalent course processing. It is similar to repeat processing but does not use repeat hours or repeat limit error checking. Mutual exclusion error checking is used

instead. This processing is used in Banner Student baseline, Banner Student Self-Service, and Voice Response.

## Implementation Steps

Use the following steps to set up mutually exclusive courses and track them through registration error checking and override processing.

1. Set up registration error checking severity for mutually exclusive courses on the Term Control Form (SOATERM).
2. Define mutually exclusive courses on the Mutual Course Exclusion Form (SCAMEXC).
3. Set up custom error messages on the Registration Error Messages Form (SFARMSG) if you wish, or use the delivered default error message for mutually exclusive courses.
4. Set up a registration permit-override code for mutually exclusive courses on the Registration Permit-Override Validation Form (STVROVR). This is optional.
5. Set up registration permit-override rules on the Registration Permit-Override Control Form (SFAROVR) where the rules include mutually exclusive courses. This is optional.
6. Perform individual registration processing in Banner Student baseline on the Student Course Registration Form (SFAREGS), in Banner Student Self-Service, and/or in Banner Voice Response, and review any mutual exclusion errors.
7. Perform mass registration processing in baseline on the Registration Mass Entry Form (SFAMREG), and review any mutual exclusion errors.
8. Define additional mutually exclusive courses as needed on the Mutual Course Exclusion Form (SCAMEXC) after registration has occurred.
9. Run the Registration Admin Messages Report (SFRRGAM) to identify any affected students who have already registered for those courses before they were defined as mutual exclusions.

## Set up Registration Error Checking for Mutually Exclusive Courses

Registration error checking can be set up for mutually exclusive courses on the Term Control Form (SOATERM). Use the **Mutual Exclusion** radio group in the Student Options in the Registration Error Checking window. This can be set to *Fatal* to prevent registration or *No Check* to not have error checking occur.

When a mutually exclusive course exists, registration processing performs validation for all sections of the course against the catalog record and the student's academic history, transfer coursework, and in-progress courses. If no mutual exclusions exist in the student's record, registration is allowed. If a mutual exclusion exists, an error message is displayed (when error checking is set to *Fatal*), and registration is not allowed.

- When academic history and transfer coursework are evaluated, and a mutually exclusive course is found, an error is generated if the student attained the minimum grade.
- When in-progress courses are evaluated, and a mutually exclusive course is found, an error is generated. (A course is considered to be “in-progress” until it is graded, at which time the grade is evaluated.)

When mutual exclusions are defined on SCAMEXC after registration has begun, the SFRRGAM report should be run to identify students who are affected by the changes. If these students then make changes to their schedules, they will receive mutual exclusion errors on any existing registration records that are part of the newly defined mutual exclusion groups.

 **Note**

Mutual exclusion error checking takes place independently of repeat hours checking and repeat limit error checking. It is controlled solely by the mutual exclusion error checking set up on SOATERM. ■

## Define Mutually Exclusive Courses

Existing courses can be associated with similar courses by defining them as mutually exclusive at the catalog level. Mutually exclusive courses are treated as reciprocal in nature, the same way equivalent courses are. Once a course has been defined as a mutual exclusion, it cannot also be defined as an equivalent. Registration error checking validates the mutually exclusive courses when a student registers for those courses. Mutually exclusive courses carry the minimum grade by level. A mutually exclusive course cannot be taken if the minimum grade has already been achieved for any course in the group.

The Mutual Course Exclusion Form (SCAMEXC) is used to define courses as mutually exclusive. These course definitions are stored in the Mutually Exclusive Course Definitions Rule Table (SCRMEXC). You can enter the subject, course, and effective term in the Key Block, and then set up the course that is mutually exclusive to that course in the Mutually Exclusive Course Definitions block. Multiple courses can be defined as mutual exclusions. You can also modify an existing mutually excluded course, or you can delete a mutually excluded course. The levels for the grade and the passing grade, which come from the Grade Code Maintenance Form (SHAGRDE), are also entered in this block. If the level is not valid for the course, a warning is displayed, but you can still enter the record.

Rules are created for an effective term in the Key Block and can be copied and ended for a term range in the Mutuality Exclusive Course Definitions Block. The from and to term information defaults in for the course from the Key Block. Use the **Maintenance** button to

create a new effective term and to copy and end the from and to term information for the course. Remember that the end term is included in the term range. For example, if a course is defined as a mutual exclusion from start term 200820 to end term 200920, term 200920 is included in the mutual exclusion definition time period. If you do not want to include term 200920, use the previous term as the end term for the mutual exclusion definition.

You do not need to set up reciprocal definitions for courses. When two courses are associated and one is mutually exclusive to the other, registration processing will recognize that the relationship exists for both courses. For example, ENGL 1005 is defined as mutually exclusive to LIT 1007 on SCAMEXC. If a student has completed ENGL 1005, that student is not permitted to register for LIT 1007. The reverse is also true. If a student has completed LIT 1007, that student is not permitted to register for ENGL 1005.

Courses can be defined as mutually exclusive for the effective term, subject, course number, level from SHAGRDE for the grade to be used, passing grade, and start and end terms. A check is performed on the level entered to make sure it is valid for the course as defined on SCACRSE. The passing grade is inclusive and is the lowest grade a student can have that restricts registration for a mutually exclusive course. For example, LIT 1007 and ENGL 1005 are mutually exclusive. The passing grade for the mutually exclusive course is “D”. A student who receives a “D” for ENGL 1005 would not be allowed to register for LIT 1007. A student who receives an “F” for ENGL 1005, however, would be allowed to register for LIT 1007.

When a student tries to register for a course that has associated mutually exclusive courses, the student’s academic history record and transfer coursework are checked to see if he/she has successfully completed any of the courses defined on SCAMEXC, based on the lowest grade allowed. In-progress courses are also checked for compliance with the courses defined on SCAMEXC. (A course is considered to be in-progress until grades are entered, whether or not those grades have been rolled to history.) If any courses are found that are defined as mutual exclusions, the registration for that course will fail, and an error will be displayed.

A course grouping can be defined as either equivalent courses or mutually exclusive courses. The grouping cannot be defined as both. Edit checking occurs on SCAMEXC to ensure that courses being entered as mutual exclusions do not already exist as equivalencies. Edit checking occurs on SCADETL to ensure that courses being defined as equivalencies do not already exist as mutual exclusions.

 **Note**

Courses cannot be defined as mutual exclusions at the CRN level. They are defined at the catalog level. Registration error checking validates the catalog record. Therefore, when a course is defined as a mutual exclusion, all sections of the course carry that definition. When a course is associated with a mutually excluded course, all sections of the course carry that association. ■

## Course Detail Error Checking

The Course Information Detail Form (SCADETL) performs an edit check that prevents a user from defining an equivalent course if the same course is already defined as a mutual exclusion. When a conflicting entry is found, a mutual exclusions error message, *\*Error\* Mutual Exclusions exist for this course. Courses may not be mutually exclusive and equivalent*, is displayed. The error appears when the user attempts to navigate out of the row (such as going to an empty row to create a new record) or when the user attempts to save the record.

When a course is defined as an equivalent or a mutual exclusion, that qualification is in effect for all terms within the effective term range and for all terms for which the start and end terms are inclusive. When an error occurs, the user should check for overlapping equivalencies or courses defined as mutual exclusions for the effective terms and the start and end term ranges.

## Set up Registration Error Messages for Mutually Exclusive Courses

If a student attempts to register for a mutually exclusive course when he/she has already taken the associated course, a registration error message is displayed. The default error message that is delivered for the Registration Error Message Rules Table (SFRRMSG) and displayed on the Registration Error Messages Form (SFARMSG) is *Mutual Exclusion with %1% %2%*, where %1% represents the subject code, and %2% represents the course number. This error message can be customized on SFARMSG by modifying the *MEXC* error message row. The mutual exclusion error message is displayed in the **Message** field on the Student Course Registration Audit Form (SFASTCA).

## Use Registration Error Overrides with Mutually Exclusive Courses

Use the **Mutual Exclusion** checkbox on the Registration Permit-Override Control Form (SFAROVR) to designate that mutual exclusion errors can be overridden for a registration permit-override rule. You can create a standalone override code for mutual exclusion errors on the Registration Permit-Override Validation Form (STVROVR) if you wish. This code can then be used to set up a specific mutual exclusion permit-override rule on SFAROVR. Or, you can use existing override codes from STVROVR to set up your override rules on SFAROVR and include mutual exclusions in those rules as needed.

## Use Registration Processing with Mutually Exclusive Courses

When registration is performed on the Student Course Registration Form (SFAREGS), error checking for the term is determined by the severity level set on SOATERM. When a student registers for a mutually exclusive course and has already taken the associated course, an error is displayed from SFARMSG. When the error checking is set to *Fatal*, the record must be deleted or overridden in order to continue with registration. When

registration is performed in Banner Student Self-Service, and the same scenario occurs, registration is not allowed, unless an override has been entered through Banner Faculty and Advisor Self-Service or Student baseline.

Mutual exclusion error checking looks for equivalent courses in the student's academic history, transfer coursework, and in-progress coursework. When a completed equivalent course is found and a mutually exclusive course exists, the student cannot register for the mutually exclusive course. For example, if a student completed ENGL 1004 with a passing grade, and ENGL 1004 is defined as an equivalent to ENGL 1005, and ENGL 1005 is defined as mutually exclusive with LIT 1007, that student is prevented from registering for LIT 1007.

## Use Mass Registration Processing with Mutually Exclusive Courses

When mass registration is performed using the Registration Mass Entry Form (SFAMREG), mutual exclusion errors will be displayed in the **Message** field in the Results window. The message that is displayed comes from SFARMSG. The message displayed can be the default message that is delivered or a customized message of your choice.

The **Mutual Exclusion** radio group in the Student Options in the Error Checking window can be set to *Fatal* or *No Check* for mass registration error checking.

## View Mutually Exclusive Courses in Self-Service

When students view courses through the catalog in Banner Student Self-Service, the detailed course and class section information indicates when courses are defined as mutually exclusive on SCAMEXC.

Mutual exclusion registration error checking is performed in Self-Service. The default error message from SFARMSG is displayed during registration, but this error message can be customized at your institution.

## Use Voice Response Registration

Voice Response processing recognizes mutual exclusion errors during telephone registration as part of registration error checking.

## Identify Students Affected by Courses Defined after Registration

The Registration Admin Messages Report (SFRRGAM) can be used to identify students who are affected when courses are defined as mutual exclusions during registration or after registration has occurred. If these students make changes to their schedules, they will receive mutual exclusion errors on any existing registration records that are part of the

newly defined mutual exclusion groups. SFRRGAM displays the mutual exclusion errors from the SFRRMSG table on the output.

## Repeat/Equivalent Course Rules

Repeat/Equivalent Course processing is controlled by the **(Repeat) Limit** and the **(Repeat) Maximum Hours** fields on the Basic Course Information Form (SCACRSE). You can specify that a course may be repeated for only a specified maximum number of hours, as well as the existing repeat limit. This is done using the **(Repeat) Maximum Hours** and **(Repeat) Limit** fields on SCACRSE. These fields are invoked in the Registration module according to the status of the registration error flags on the Term Control Form (SOATERM) and are calculated in Academic History according to the Repeat/Equivalent Course Rules Form (SHARPTR).

### Note

The **Repeat Status (Code)** field on SCACRSE does not control any processing. It is informational only. ■

### **Example 1:**

Using both Repeat Limits and Repeat Maximum Hours in Repeat processing works like this:

Repeat Limit	3
Repeat Maximum Hours	Null

The course may be taken up to four times for an unlimited number of credits.

### **Example 2:**

Repeat Limit	Null
Repeat Maximum Hours	12

The course may be taken up to as many times as desired, as long as the credit hours do not exceed 12.

### **Example 3:**

Repeat Limit	3
Repeat Maximum Hours	10

Using a three credit hour course, if the course is taken four times, as allowed by the Repeat Limit, this would exceed the Repeat Maximum Hours of 10 (three credits multiplied by four occurrences equals twelve), so the fourth occurrence would not be allowed.

Please see the Repeat/Equivalent Course Rules section in the “Academic History Procedures” for a detailed explanation and more examples of Repeat processing.

## Tuition Fee Waivers

To indicate that a course should not have the customary tuition and fee charges, check the **Tuition Waiver** box on the Basic Course Information Form (SCACRSE). This indicates to the system that this course is exempt from tuition and fees which are overrideable when the **Override** box is checked on the Registration Fees Process Control Form (SFARGFE). If this field is checked, all rules on SFARGFE which are overrideable will be ignored during fee assessment. If this field is not checked, all rules on SFARGFE apply.

If it is determined by your institution that a fee other than the customary tuition and fees should be charged for this course, check the **Tuition Waiver** box and assign a fee code on the Course Detail Information Form (SCADETL). You must enter an amount when assigning a fee code. A flat fee or a per credit hour fee may be charged. This determination must be made by your institution when entering the fee code.

This information will default to each of the sections created for this course. This information may be modified on section-by-section basis.

### Note

Once a waiver has been created for a section and enrollment has begun, the **Tuition Waiver** box should not be changed, so that fees are assessed correctly. ■

## Banner Course Data Extract Capabilities

Data extract capabilities allow flexibility for processing. A utility program is used to extract course information from the Banner database. Extracted course data are written to an XML file and conform to the IMS Enterprise Information Model 1.01.

The IMS Enterprise Information Model describes data structures that are used to provide interoperability of Internet-based Instructional Management systems with other enterprise systems used to support the operations of an organization. These structures provide the basis for standardized data bindings that allow software developers and implementers to create instructional management processes that interoperate across systems developed independently by various software developers. In other words, use of the IMS model facilitates third party interfaces.

### Overview

This section describes the basic integration components of SunGard® Higher Education software that enables users to extract course data for presentation to third parties.

## Course Data Extract Processing

Banner extract processing will extract your course data and provide it in an XML format readable to third parties using IMS standards. The Course Catalog IMS Extract (SCRIMS) creates the IMS Properties object and the IMS Course Group Data Object.

### Course Data

This section outlines the course-related data elements passed between Banner and the partner systems.

### Course Data Details

Item	Banner Source	IMS Data Element
Course Identifier	SCBCRSE_SUBJ_CODE concatenated with SCBCRSE_CRSE_NUMB	SOURCEDID.ID
Course Title	SCBCRSE_TITLE	DESCRIPTION.SHORT
Full Course Description	SCRTEXT_TEXT	DESCRIPTION.FULL
Course Department	SCBCRSE_DEPT_CODE	ORG.ORGUNIT
Course Active Indicator	Set to 0 (Not Accepting Enrollments). Cannot enroll in Banner course; enrollment occurs in Banner course section.	ENROLLCONTROL.ENROLLACCEPT
Course Enrollment Indicator	Set to 0 (Target system cannot enroll).	ENROLLCONTROL.ENROLLALLOWED
Course Begin Date	STVTERM_START_DATE Start date of the minimum effective term.	TIMEFRAME.BEGIN
Course End Date	STVTERM_END_DATE End date of the maximum effective term.	TIMEFRAME.END
Academic Year	STVACYR_DESC	TIMEFRAME.ADMINPERIOD
Source ID	GUBINST_NAME concatenated with "Banner" TYPEVALUE of 1 (Instruction), 3 (Course)	SOURCEDID.SOURCE
Institution Name	GUBINST_NAME	ORG.ORGNAM
Institution FICE Code	SHBCGPA_INST_FICE	ORG.ORGID

Item	Banner Source	IMS Data Element
Delivery Mode	STVSCHD_DESC	EXTENSION DELIVERY MODE
Data Source	GUBINST_NAME concatenated with “Banner”	DATASOURCE

## IMS Properties Object

The XML file created by the extract program contains an IMS Properties Object. This object contains basic packaging and control data that the target system(s) use to determine the source, timing, and type of event that generated the data package. This basic information and control data facilitate the exchange of data between systems.

## The IMS Course Group Data Object

The Course Catalog IMS Extract (SCRRIMS) also creates an IMS Course Group Data Object. This object contains course code, course title, full course descriptions, course start and end dates, and course delivery mode. The collection of these IMS Course Data Objects is a reflection of your institution’s course catalog for the selected academic year.

## SCRRIMS Program Parameters

When you run the Course Catalog IMS Extract (SCRRIMS), you are prompted to enter the academic year for which course catalog information will be extracted. Valid values come from the Academic Year Validation Form (STVACYR).

## SCRRIMS Program Outputs

The Course Catalog IMS Extract (SCRRIMS) runs through job submission. and creates up to three separate files that are written to the standard job submission subdirectory. If job submission results are written to a personal job submission directory, these results will usually also be written there.

The three files created by SCRRIMS are:

<b>File</b>	<b>Description</b>
<code>scrims_&lt;oneup&gt;.log</code>	This is a standard job submission log report. If the process is successful, the log report contains a success completion message.  If the process fails, the log may include error messages that will assist in diagnosing problems.
<code>scrims_&lt;oneup&gt;.lis</code>	This is the standard listing report, which includes the standard report control page. This page lists the current version number of the process and the parameters used to run the process.
<code>scrims_&lt;oneup&gt;.xml</code>	This is the XML file that will be imported into a partner's database.

## America's Learning Exchange with Banner

America's Learning Exchange (ALX) no longer has an active website ([www.alx.org](http://www.alx.org)). The United States Department of Labor has discontinued support for uploading course data to the ALX website. Institutions may continue to use the SCRIMMS process to extract course data to send to any third party that accepts course information in XML format.

## Catalog Extract and Load Processing

This processing allows a receiving institution to automatically extract catalog records from a sending institution and then load those records into their own database. This aids in the creation and setup of catalog records from multiple transfer institutions within the receiving institution's database. This functionality is a base for self-service transfer credit modeling, which can assist receiving institutions with processing prospective transfer students and reducing paper work and coordination by admissions and advising staffs.

Catalog extract and load processing provides the ability to:

- Exchange the necessary course catalog data for transfer articulation purposes.
- Extract course catalog data into a file that can be transmitted to an external institution.
- Import external catalog data into the appropriate transfer articulation data structures.
- Update existing but previously imported transfer articulation data.
- Store course descriptions and course attributes for transfer courses.
- Copy transfer course data from one institution to another.

## Exchanging Data for Transfer Articulation

Course catalog data can be exchanged for use with transfer articulation. Maintaining transfer course data represents a large portion of the effort required for transfer articulation, because institutional equivalents of transfer courses cannot be defined until the transfer course data exists within the receiving school's database. This streamlined exchange using the extract and import of catalog data between institutions significantly reduces the amount of manual data entry.

## Extracting Data for File Transmission

Course catalog data can be extracted into a file that can be transmitted to an external institution. Course catalog data elements have been identified that need to be exchanged between institutions for transfer articulation purposes. These data elements can be extracted from the sending institution's database and written to a file that can be sent to and retrieved by the receiving institution.

### Note

This functionality takes into account the work being done by PESC on an XML schema for course catalog data transmissions. When fields in the Postsecondary Electronic Standards Council (PESC) Course Catalog XML schema contain enumeration lists, values not on those lists will not be included in the extract. ■

The Course Catalog Data Extract Process (SCRCATE) produces a course catalog data extract file with specified results. The Course Catalog package (`bwckctlg.sql`) in Student Self-Service contains a link that produces query results in an XML format that can be saved to a user's desktop.

Different types of extract files can be created by SCRCATE:

- Extract file of course catalog data that includes all courses from a specific level and catalog year and can be displayed on an unsecured page of the institution's website, sent to a third party (such as another institution or a Web-based repository of catalog data), or stored on a server to be transmitted upon request.
- Extract file of course catalog data that is limited to the courses from a specific college, department, or subject for administrative and/or departmental review.
- Extract file of course catalog data that is limited to those courses that are returned by the criteria entered using the unsecured Search for Courses Web page.

## Importing External Data for Transfer Articulation

External catalog data can be imported into the appropriate transfer articulation data structures. The Transfer Catalog Data Import Process (SHRTCIM) imports course catalog data from other institutions into Banner. Extract files received from other institutions can be imported into the tables behind the Transfer Institution Catalog Entry Form (SHATATC). Data does not need to be entered manually.

Here are some different examples of how the batch import process could be used in Update Mode:

- A new institution is being set up for transfer articulation processing. All records in a course catalog extract file are new to the system. (No transfer course records exist for the institution.) SHRTCIM is run in Update Mode to import all records into the system.
- A new course catalog extract file is obtained from an institution from which the receiving school has not had any transfer applicants in several years. All existing records in the system are at least five years old. SHRTCIM is run in Update Mode to import all records from the extract file, even though many already exist with an earlier effective term.

## Updating Existing Imported Data

Existing, previously imported transfer articulation data can be updated. When SHRTCIM is run in Audit Mode, a report is generated that shows which incoming courses are completely new, which are exact matches of existing records, and which are partial matches of existing records. You can choose to protect certain existing records from being updated by the import process, because they match data that exists in the extract file being imported.

Here are examples of how SHRTCIM could be run multiple times in Audit Mode:

- One or more incoming records are found to be duplicates of existing records based upon several elements including effective term, subject, course number, and level. The user needs to be able to protect those courses from being updated when the import process is run again in Update Mode.
- Several incoming records are found to be similar to existing records based upon subject and course number only. Some elements (such as effective term, level or credit hour range values) of the existing records differ from those of the incoming record. The user needs to be able to decide whether to include or exclude such records when the process is run again in Update Mode.

## Storing Course Details, Descriptions, and Attributes

Course details, descriptions, and attributes for transfer courses can be stored on the Transfer Institution Catalog Entry Form (SHATATC) and the Transfer Course Articulation Form (SHATATR) to assist with the review of transfer courses and assignment of institutional equivalents. Until PESC delivers the course catalog schema, only 2000 characters of the course description will be captured and transmitted.

- On SHATATC, course detail and description information can be maintained in the Transferring Course Block. Course attribute information can be maintained in the Course Attributes block. This data can be collected to help in the determination of which courses are institutional equivalents. The **Protect from Import** field in the

Course Details section is used to protect selected records from being updated by the Transfer Catalog Data Import Process (SHRTCIM).

- On SHATATR, course detail and description information can be maintained in the Transferring Course Block. Course attribute information can be maintained in the Attributes section. This data can be collected to help in the determination of which courses are institutional equivalents. The **Protect from Import** field in the Details section is used to protect selected records from being updated by the Transfer Catalog Data Import Process (SHRTCIM).

Course attributes can be crosswalked on SOAXREF using the value of *STVATTR* on *STVXLBL* and can then be used in the extract export file.

## Copying Data to Another Institution

Transfer course data can be copied from one institution to another. Copy functionality can be used when separate institution codes are being set up for different campuses of the same school. Use the Transfer Institution Catalog Entry Form (SHATATC) and the Transfer Course Articulation Form (SHATATR) to copy transfer course data from a default institution code to another institution code for a specific program.

### Using the Default Institution and Copy Options

You can use the Edit function from the **Program** field on SHATATC and SHATATR to display a list of unique program codes for which transfer courses have been defined for the institution code entered in the Key Block. (The Programs Defined for Institution item in the Option List can also be used.)

You can enter a value in the **Default Institution** field on SHATATC and SHATATR and perform a Next Block to copy all existing transfer course records associated with the **Default Institution** value into the tables for the STVSBGI code entered in the **Institution** field, subject to certain limitations. The limitations are that in order for a transfer course record to be copied, its level code must be valid according to the records in the Transfer Levels block of the Transfer Articulation Institution Form (SOABGTA).

Since it cannot be assumed that effective terms for different transfer level codes defined in the Transfer Level block of SOABGTA are the same from institution to institution, transfer level effective terms play an important role in determining the effective term of transfer courses when they are defaulted from one institution to another. Please see the example below for more details.

Institution A and Institution B have the following transfer levels defined on SOABGTA with the corresponding effective terms:

Transfer Level Codes	Effective Term Codes	Effective Term Codes
	Institution A	Institution B
CE	199010	N/A
GR	199510	199310
UG	200010	200510

Institution A has several courses defined at each transfer level shown above. All of the CE level courses have an effective term of 199010, all of the GR courses have an effective term of 199510, and all of the UG courses have an effective term of 200010. In other words, each transfer course's effective term matches the effective term of its level as defined on SOABGTA.

When a user defaults the courses from Institution A to Institution B, the expected results are:

- None of the CE level courses are copied, because that level is not valid for Institution B.
- All of the GR level courses are copied with an effective term of 199510, because that was the earliest (known) effective term for those courses. The system cannot assume the courses were effective in 199310.
- All of the UG level courses are copied with an effective term of 200510, because that is the earliest effective term for UG courses at Institution B.

If values are entered in both the **Program** and **Default Institution** fields before a Next Block function is performed, this indicates the intent to copy only those course records from the default institution that have been defined for that program. In this case, a warning message is displayed that only those courses defined for that program will be copied, and the **Default Institution** function cannot be used again. You have the option to cancel the copy process, which will roll back all of the changes and remove the value from the **Program** field. You also have the option to continue, in which case only those records defined for the program will be copied.

If records exist with a value defined in the **Minimum Grade** field that has not been defined in SHATGRD for the new institution, the *Invalid Grade code exists* warning message will be displayed. You have the option to cancel the copy process, which will roll back all of the changes and allow you to define the missing grade codes in SHATGRD. You also have the option to continue, in which case the records will be copied, but with a null value in the **Minimum Grade** field.

If records exist in the Comments block and/or Course Attributes block for the transfer courses being defaulted from one institution to another, you are prompted once to decide if the system should copy those records as well.

## Course Catalog Data Extract Process (SCRDATE)

This Java process is used to extract course catalog data and create an XML output file of that data. An institution can post the output file on an unsecured page of its website where people seeking the data can download it to their workstations. Similarly, the output file can be sent to a third-party organization that hosts a Web-based repository of course catalog data.

The process uses the same search parameters that are available on the Search for Courses page in Banner Student Self-Service, as well as additional parameters. These additional parameters allow users to determine if the output file should include course description data and/or course attributes. This process calls the SP\_CATALOG\_EXPORT process API, which contains all of the logic required to return the correct records and data fields.

The XML output file for the extract process includes the fields listed in the table below. The HTML output file for the extract contains a subset of those fields such as subject, course number, and course short title. Additional fields can be included in the HTML file by modifying the stylesheet template. The stylesheet can be configured at your institution to display the fields you choose. To modify the stylesheet, do the following:

1. Extract the stylesheet using the command: `jar -xvf scrdate.jar bwckctlg.xml`
2. Modify the stylesheet to display the selected fields in the HTML file.
3. Upload the modified stylesheet using the command: `jar -uvf scrdate.jar bwckctlg.xml`

Until a standard schema for the XML file has been adopted by the Postsecondary Electronic Standards Council (PESC), the following fields will comprise the extract file.

XML Field	Table Column	Additional Information
<i>Header Record Information</i>		
<Organization>		<i>Complex elements made up of the items below</i>
<FICE>	SHBCGPA_INST_FICE	Defined on SHACTRL
<OPEID/>		
<OrganizationName>	GUBINST_NAME	Defined on GUAINST
<Contacts>		<i>Complex element made up of the Address and Phone complex elements</i>
<Address>		<i>Complex element made up of the items below</i>
<AddressLine>	GUBINST_STREET_LINE1	Defined on GUAINST

XML Field	Table Column	Additional Information
<AddressLine>	GUBINST_STREET_LINE2	Defined on GUAINST
<AddressLine>	GUBINST_STREET_LINE3	Defined on GUAINST
<City>	GUBINST_CITY	Defined on GUAINST
<StateProvince>	GUBINST_STAT_CODE	Defined on GUAINST
<PostalCode>	GUBINST_ZIP	Defined on GUAINST
<CountryCode>	GUBINST_NATN_CODE	Defined on GUAINST
<Phone>		<i>Complex element made up of the items below</i>
<AreaCityCode>	GUBINST_PHONE_AREA	Defined on GUAINST
<PhoneNumber>	GUBINST_PHONE	Defined on GUAINST
<PhoneNumberExtension>	GUBINST_PHONE_EXT	Defined on GUAINST
<i>Course Detail Record Information</i>		
<CourseSubjectAbbreviation>	SCBCRSE_SUBJ_CODE	Defined on SCACRSE
<CourseNumber>	SCBCRSE_CRSE_NUMB	Defined on SCACRSE
<CourseShortTitle>	SCBCRSE_TITLE	Defined on SCACRSE
<CourseLongTitle>	SCBCRSE_TITLE	Defined on SCACRSE
		Once the PESC schema for course catalog data is finalized, the source for this field will most likely change to the SCRSYLN_LONG_COURSE_TITLE defined on SCASYLB.
<CourseDescription>	SCBDESC_TEXT_NARRATIVE	Defined on SCADETL
<CourseEffectiveDate>	STVTERM_START_DATE	The effective date for course is derived from the start date defined for the term code that is assigned as the effective term for the course.

XML Field	Table Column	Additional Information
<CourseCreditBasis>	Hardcoded to <i>Regular</i>	This value needed to be set to an enumerated value established for the PESC college transcript schema which uses the same field. Given that <i>Regular</i> was the value hardcoded into the XML transcript export process, it was also selected for this process. This value may be re-evaluated once the PESC course catalog schema is adopted as a standard.
<CourseCreditUnits>	STVTERM_TRMT_CODE or SHBCGPA_TRMT_CODE	The process checks the <b>Term Type</b> value on STVTERM, if it is not defined, it then checks the <b>Term Type</b> value on SHACTRL to retrieve this value.
<CourseCreditMinimumValue>	SCBCRSE_CREDIT_HR_LOW	Defined on SCACRSE
<CourseCreditMaximumValue>	SCBCRSE_CREDIT_HR_HIGH	Defined on SCACRSE
<CourseLevel>		<i>Complex element made up of the items below</i>
<CourseLevelCode>	SCRLEVL_LEVEL_CODE	Defined on SCACRSE
<CourseLevelDescription>	STVLEVL_DESC	Institutional course level codes must be cross-referenced on SOAXREF to one of the enumerated values defined by PESC.
<Attribute>		<i>Complex element made up of the items below</i>
<RAPCode>	SCRATTR_ATTR_CODE	Defined on SCADETL
<RAPName>	STVATTR_DESC	To be included in the catalog extract, course attributes must be cross-referenced on SOAXREF.

## Transfer Catalog Data Import Process (SHRTCIM)

This Java process is used to import an XML extract file of course catalog data into a Banner database. After entering the input file name and other default values, the user can choose between running the process in Audit Mode or Update Mode. In Audit Mode, the process compares the records in the incoming data file with transfer course records that already exist in the system. Records in the incoming data file that are found to match existing records will be identified as partial or exact matches.

When run in Audit Mode, the process calls the SB\_TRANSFER\_CRSE API for matching logic.

- If an incoming transfer course does not match any existing transfer courses based on the institution ID plus the subject plus the course number plus the transfer level, then it will be identified as a new record.
- If an incoming transfer course matches an existing transfer course based on institution ID, plus the program, plus the transfer level, plus the subject, plus the course number, plus the effective term, plus the group, then it will be identified as an exact match (even though values in the Title, Credit Hours Low, Credit Hours High, Minimum Grade, Catalog Year, and Course Description fields may differ).

Existing transfer courses that have been entered with a value in the Program and/or Group fields will not match incoming transfer course records. As such, many incoming transfer course records that do match existing records based upon institution ID, plus transfer level, plus the subject, plus the course number, plus the effective term, but not on program or group, will fall into the next category.

- If an incoming transfer course does not satisfy the criteria to be identified as new or an exact match, then it will be flagged as a partial match.

After the input file has been processed in Audit Mode, users can review those courses identified as exact matches to see if any data exists in the Title, Credit Hours Low, Credit Hours High, and/or Course Description fields that should be added to the system. If not, you can check the **Protect from Import** field for the existing transfer courses in the Transfer Institution Catalog Entry form (SHATATC) or the Transfer Course Articulation form (SHATATR). Those courses will not be updated when the input file is processed again in Update Mode.

Similarly, after the input file has been processed in Audit Mode, users can review those courses identified as partial matches to see if any data exists in the Title, Credit Hours Low, Credit Hours High, and/or Course Description fields that should not be added to the system. If so, the **Protect from Import** field can be checked for those records, and those courses will not be updated when the input file is processed again in Update Mode.

When the process is run in Update Mode, new records from the input file are imported into the SHBTATC and SHRTCAT tables. Records identified as exact matches will update the existing records, unless the **Protect from Import** field is checked. Records identified as partial matches will update existing records if the matched fields are the Institution ID, Effective Term, Transfer Level, Subject, and Course Number, unless the **Protect from Import** field is checked. Otherwise, the partial matches will be loaded as new courses.

Banner Table	Table Column	Additional Information
<i>SHBTATC</i>		<i>Transfer Course Information</i>
	SBGI_CODE	Institution ID parameter
	PROGRAM	Defaults to “.....”

Banner Table	Table Column	Additional Information
	TLVL_CODE	Comes from <CourseLevelCode> Value must be defined on STVTLVL and be valid for the institution ID on SOABGTA.
	SUBJ_CODE_TRNS	Comes from <CourseSubjectAbbreviation> Value is not validated by Banner.
	CRSE_NUMB_TRNS	Comes from <CourseNumber>
	TERM_CODE_EFF_TRNS	Effective Term parameter
	ACTIVITY_DATE	Defaults to system date
	TRNS_TITLE	Comes from <CourseShortTitle>
	TRNS_LOW_HRS	Comes from <CourseCreditMinimumValue>
	TRNS_HIGH_HRS	Comes from <CourseCreditMaximumValue>
	TRNS_REVIEW_IND	Defaults to <i>N</i>
	TAST_CODE	Status Code parameter
	TRNS_CATALOG	Catalog Year parameter
	TGRD_CODE_MIN	Minimum Grade parameter
	GROUP	Defaults to NULL
	GROUP_PRIMARY_IND	Defaults to NULL
	CRSE_DESC	Comes from <CourseDescription>
	USERID	Defaults to user ID of person running the process
	DATA_ORIGIN	Defaults to either SHATATC, SHATATR, or SHRTCIM
	PROTECT_IND	Defaults to <i>N</i>
<i>SHRTCAT</i>		<i>Transfer Course Attributes</i>
	SBGI_CODE	Institution ID parameter
	PROGRAM	Defaults to “.....”

Banner Table	Table Column	Additional Information
	TLVL_CODE	Comes from <CourseLevelCode>  Value must be defined on STVTLVL and be valid for institution ID on SOABGTA.
	SUBJ_CODE_TRNS	Comes from <CourseSubjectAbbreviation>  Value is not validated by Banner.
	CRSE_NUMB_TRNS	Comes from <CourseNumber>
	TERM_CODE_EFF_TRNS	Effective Term parameter
	ATTR_CODE	Comes from <RAPCode>  Value is not validated by Banner.
	ATTR_DESC	Comes from <RAPName>
	USERID	Defaults to user ID of person running the process
	ACTIVITY_DATE	Defaults to system date
	DATA_ORIGIN	Defaults to SHRTCIM

## Oracle Object Types

Oracle object types are used with this processing. The delivered scripts listed below create the object types.

Script	Result
soo_xfer_crse0.sql	Creates the Oracle Object Type (OOT) so_transfer_course
soo_xfer_crse_nt.sql	Creates a table of so_transfer_course
soo_xfer_crse_levl0.sql	Creates the Oracle Object Type (OOT) so_transfer_course_level
soo_xfer_crse_levl_nt.sql	Creates a table of so_transfer_course_level
soo_xfer_crse_atr0.sql	Creates the Oracle Object Type (OOT) so_transfer_course_attr
soo_xfer_crse_atr_nt.sql	Creates a table of so_transfer_course_attr

The intent of the Oracle Object Type is to represent the PESC Course Catalog Schema once it has been officially delivered. The version delivered with Release 8.0 represents a very small subset of what PESC may deliver in the future for their final implementation of the Course Catalog Schema. This subset is listed below.

<b>Course Catalog Schema</b>	<b>Description</b>
COURSESUBJECTABBREVIATION	VARCHAR2(10 CHAR)
COURSENUMBER	VARCHAR2(15 CHAR)
COURSESUBNUMBER	VARCHAR2(15 CHAR)

COURSEREPEATCODETYPE	VARCHAR2(30 CHAR)
COURSELEVEL	BANINST1.SO_TRANSFER_COURSE_LEVEL_NT
COURSEATTRIBUTE	BANINST1.SO_TRANSFER_COURSE_ATTR_NT

## Catalog Reports

This section contains a sample of each report in the Catalog module. Parameter descriptions are also included for your convenience.

The following reports are run through the Catalog module:

Bulletin Report	(SCRBULT)
Course Catalog IMS Extract	(SCRRIMS)
Course Catalog Data Extract Process	(SRCRATE)

## Bulletin Report (SCRBULT)

**Description** This report is used to print the catalog of courses, with detailed information including descriptive text, prerequisites, corequisites, CAPP area and program requirements, DegreeWorks prerequisites, long course titles and descriptions, and duration information. Courses that are defined as equivalent courses or mutually exclusive courses display that designation on the report.

Use the **Prerequisite Check Method** radio group on either the Catalog Prerequisite and Test Score Restrictions Form (SCAPREQ) or the Basic Course Information Form (SCACRSE) to select which type of prerequisite requirements will be in effect for the courses listed in the report. The choices are *Basic or None*, *CAPP*, or *DegreeWorks*. The default value is *Basic or None*.

- When the **Prerequisite Check Method** field is set to *Basic or None*, course test score and prerequisite restrictions will be listed for the courses in the report.
- When the **Prerequisite Check Method** field is set to *DegreeWorks* or *CAPP*, DegreeWorks prerequisite requirements or CAPP area prerequisite requirements will be listed for the courses in the report.
- When DegreeWorks is installed, the *CAPP* option is not available.
- When CAPP area prerequisite checking is in use, the *DegreeWorks* option is not available.

Basic prerequisites are displayed when the SCBCRSE\_CAPP\_PREREQ\_TEST\_IND column is set to *B* for a course and prerequisites exist on SCAPREQ.

The report displays DegreeWorks course prerequisites when DegreeWorks prerequisite checking is in use. The process checks whether the SCBCRSE\_CAPP\_PREREQ\_TEST\_IND column is set to *D* for a course. It then calls the DegreeWorks Description Service to obtain the prerequisite descriptions scribed in the remarks in the Requisite blocks associated with the course.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Academic Year	Yes	Enter the academic year for which you want the report printed.	Academic Year Validation Form (STVACYR)
	Print Long Course Title	Yes	Enter <i>Y</i> to print the long course title from SCRSLYN or <i>N</i> to not print the long course title and print the existing course title from the record on SCBCRSE instead. If no long course title is available for the course, the existing information from SCBCRSE will be printed. <i>N</i> is the default.	<i>Y</i> Print long course title from SCRSLYN <i>N</i> Print existing course title from SCBCRSE
	Print Long Course Description	Yes	Enter <i>Y</i> to print the long course description from SCBDESC or <i>N</i> to not print the long course description and instead print the existing course description from the record on SCRTEXT. If no long course description is available for the course, the existing information from SCRTEXT will be printed. <i>N</i> is the default.	<i>Y</i> Print long course description from SCBDESC <i>N</i> Print existing course description from SCRTEXT

## Report Sample—Bulletin Report (SCRBULT)

04-SEP-2010 10:25:17 AM  
2010

SUNGARDHE University  
Bulletin Report

PAGE 5  
SCRBULT

College of Arts & Sciences

English

### COMA - Communication Arts

1120 - Public Speaking  
3.000 Credits  
Mutual Exclusions: ENGL 101 UG D ENGL 1055 UG D ENGL 500 GR D

Principles of communication related to speech composition and delivery: finding, analyzing, organizing and presenting material in ways appropriate to and effective with listeners.

History

### HIST - History

1201 - The United States to 1877  
3.000 TO 5.000 Credits  
Prerequisites: HIST 1112 and HIST 201

American colonial beginnings, the Revolution. Formation of the new nation, Jeffersonianism and Jacksonianism, expansion the slavery crisis, the Civil War and Reconstruction.

Mathematics

### MATH - Mathematics

1230 - Introductory Statistics  
3.000 Credits  
Mutual Exclusions: MATH 1030 UG D

Frequency distribution, descriptive statistics, probability expectations, binomial, Poisson, hypergeometric and normal distribution.

Law School

### LAW - Law

7033 - Structured Finance  
2.000 Credits  
Must be enrolled in one of the following Levels:  
Law

Structured finance is a new and rapidly expanding area of the law, in which companies raise money by selling assets to vehicle companies that issue securities. This raises many interesting legal topics, including bankruptcy, securities law, corporation law, secured transactions and the Uniform Commercial Code, taxes, and pensions. Offered odd-numbered years only.

7065 - Corporate Finance  
3.000 Credits  
Must be enrolled in one of the following Levels:  
Law

The financing of corporations, with emphasis on legal and economic issues relating to the valuation of the concern, the rights of bondholders and preferred stockholders, capital structure and dividend policy. Offered odd-numbered years only.

Chemistry

CHEM - Chemistry

- 1108 - General Chemistry II Lab  
1.000 Credits  
Prerequisites: CHEM 1131 UG D and CHEM 1103 UG D  
Co-requisites: CHEM 1134  
Mutual Exclusions: CHEM 1212 UG D

An introduction to the fundamental laws and theories of chemistry: atomic theory, chemical bonding, chemical kinetics and chemical equilibrium. Prediction of the products formed in chemical reactions. Quantitative calculations will be included in all topics.

College of Engineering  
Engineering Technology

ELET - Electronic Engineering Tech

- 102 - Circuit Analysis  
4.000 Credits  
Must be enrolled in one of the following Major fields of study:  
Electronic Technology  
Prerequisites: ELET 101 CR D and TMTH 101 CR D

A continuation of Electric Circuits. This course includes circuit analysis techniques--network theorems such as Norton's, Thevenin's mesh analysis, nodal analysis, and maximum power transfer theorem, are covered. Treatment is given to circuits containing dependent and independent sources of voltage and current. Resonance is covered in detail as well as transformers and 3-phase circuits. Laboratory experiments are designed to reinforce the classroom work.

- 210 - Electronics II  
4.000 Credits  
Must be enrolled in one of the following Major fields of study:  
Electronic Technology  
Prerequisites: ELET 102 CR D and ELET 110 CR D

A continuation of Electronics I with emphasis on small signal analysis, low and high frequency effects, Bode plotting, feedback amplifiers, and power supplies.

- 225 - Digital Electronics  
2.000 Credits  
Must be enrolled in one of the following Major fields of study:  
Electronic Technology  
Prerequisites: ELET 102 CR D and ELET 110 CR D and ELET 121 CR D

This course serves as a continuation of EL 120 for students in the Electronics program. Topics covered include diode and transistor switching circuits, with emphasis on the circuitry used in the most popular logic families, and on interfacing requirements. Additional study is devoted to combinational, sequential, asynchronous, and synchronous logic systems. Laboratory work provides experience in breadboarding and testing the circuits students design.

School of Technology  
Computer Science

COMP - Computer Science

- 304 - AI: Principles & Techniques  
3.000 Credits  
14.00 Weeks  
Prerequisites: COMP 205 UG C- and COMP 201 UG C- and COMP 202 UG C- \*
- 403 - Microsoft Tech Fundamentals  
3.000 Credits  
14.00 Weeks

College of Arts & Sciences  
Natural Sciences

ANTH - Anthropology

- 101 - Anthropology and Science  
3.000 Credits  
May not be enrolled in one of the following Departments:  
Biology  
School of Technology  
Co-requisites: ACCT 103 ACCT 2310 ACCT 2340 ACCT 9917 ART 4  
Mutual Exclusions: ANTH 3055 UG D

ASTR - Astronomy

- 1101 - The Solar System  
3.000 Credits

An essentially non-mathematical approach to the study of the planets and their satellites, comets, and meteors with special emphasis on information gained from recent lunar and interplanetary space probes; the origin and development of the solar system and the possibility of the existence of extraterrestrial life in the Solar System. Observation of the moon and some planets from the University Observatory is required. For Arts and Business students.

GEOL - Geology

- 1040 - Historical Geology  
3.000 Credits  
Prerequisites: GEOL 1030 UG D and GEOL 1031 UG D  
Co-requisites: GEOL 1041  
Mutual Exclusions: GEOL 1040 UG D GEOL 1042 UG D

Origin and geological history of the earth and development of its animal and plant inhabitants revealed in rocks and fossils.

# Course Catalog Data Extract Process (SCRCATE)

**Description** This Java process is used to extract course catalog data and create an XML output file of that data. An institution can post the output file on an unsecured page of its website where people seeking the data can download it to their workstations. Similarly, the output file can be sent to a third-party organization that hosts a Web-based repository of course catalog data. This process calls the SP\_CATALOG\_EXPORT process API.

The XML output file for the extract process includes the fields listed in the table below. The HTML output file for the extract contains a subset of those fields such as subject, course number, and course short title. Additional fields can be included in the HTML file by modifying the stylesheet template. The stylesheet can be configured at your institution to display the fields you choose. To modify the stylesheet, do the following:

1. Extract the stylesheet using the command: `jar -xvf scrcate.jar bwckctlg.xml`
2. Modify the stylesheet to display the selected fields in the HTML file.
3. Upload the modified stylesheet using the command: `jar -uvf scrcate.jar bwckctlg.xml`

Until a standard schema for the XML file has been adopted by the Postsecondary Electronic Standards Council (PESC), the following fields will comprise the extract file.

XML Field	Table Column	Additional Information
<i>Header Record Information</i>		
<Organization>		<i>Complex elements made up of the items below</i>
<FICE>	SHBCGPA_INST_FICE	Defined on SHACTRL
<OPEID/>		
<OrganizationName>	GUBINST_NAME	Defined on GUAINST
<Contacts>		<i>Complex element made up of the Address and Phone complex elements</i>
<Address>		<i>Complex element made up of the items below</i>
<AddressLine>	GUBINST_STREET_LINE1	Defined on GUAINST

<b>XML Field</b>	<b>Table Column</b>	<b>Additional Information</b>
<AddressLine>	GUBINST_STREET_LINE2	Defined on GUAINST
<AddressLine>	GUBINST_STREET_LINE3	Defined on GUAINST
<City>	GUBINST_CITY	Defined on GUAINST
<StateProvince>	GUBINST_STAT_CODE	Defined on GUAINST
<PostalCode>	GUBINST_ZIP	Defined on GUAINST
<CountryCode>	GUBINST_NATN_CODE	Defined on GUAINST
<Phone>		<i>Complex element made up of the items below</i>
<AreaCityCode>	GUBINST_PHONE_AREA	Defined on GUAINST
<PhoneNumber>	GUBINST_PHONE	Defined on GUAINST
<PhoneNumberExtension>	GUBINST_PHONE_EXT	Defined on GUAINST
<i>Course Detail Record Information</i>		
<CourseSubjectAbbreviation>	SCBCRSE_SUBJ_CODE	Defined on SCACRSE
<CourseNumber>	SCBCRSE_CRSE_NUMB	Defined on SCACRSE
<CourseShortTitle>	SCBCRSE_TITLE	Defined on SCACRSE
<CourseLongTitle>	SCBCRSE_TITLE	Defined on SCACRSE

Once the PESC schema for course catalog data is finalized, the source for this field will most likely change to the SCRSYLN\_LONG\_COURSE\_TITLE defined on SCASYLB.

XML Field	Table Column	Additional Information
<CourseDescription>	SCBDESC_TEXT_NARRATIVE	Defined on SCADETL  The precision of this element will likely change once the PESC schema for course catalog data has been finalized.
<CourseEffectiveDate>	STVTERM_START_DATE	The effective date for course is derived from the start date defined for the term code that is assigned as the effective term for the course.
<CourseCreditBasis>	Hardcoded to <i>Regular</i>	This value needed to be set to an enumerated value established for the PESC college transcript schema which uses the same field. Given that <i>Regular</i> was the value hardcoded into the XML transcript export process, it was also selected for this process. This value may be re-evaluated once the PESC course catalog schema is adopted as a standard.
<CourseCreditUnits>	STVTERM_TRMT_CODE or SHBCGPA_TRMT_CODE	The process checks the <b>Term Type</b> value on STVTERM, if it is not defined, it then checks the <b>Term Type</b> value on SHACTRL to retrieve this value.
<CourseCreditMinimumValue>	SCBCRSE_CREDIT_HR_LOW	Defined on SCACRSE
<CourseCreditMaximumValue>	SCBCRSE_CREDIT_HR_HIGH	Defined on SCACRSE
<CourseLevel>		<i>Complex element made up of the items below</i>
<CourseLevelCode>	SCRLEVL_LEVL_CODE	Defined on SCACRSE
<CourseLevelDescription>	STVLEVL_DESC	Institutional course level codes must be cross-referenced on SOAXREF to one of the enumerated values defined by PESC.

XML Field	Table Column	Additional Information
<Attribute>		Complex element made up of the items below
<RAPCode>	SCRATTR_ATTR_CODE	Defined on SCADETL
<RAPName>	STVATTR_DESC	To be included in the catalog extract, course attributes must be cross-referenced on SOAXREF.

Parameters	Name	Required?	Description	Values
	Catalog Term	Yes	Enter the catalog term for which courses must be valid to be included in the extract file.  To be valid, a course must have a status code with the <b>Active (Indicator)</b> checked on STVCSTA, and the effective term on the SCBCRSE record must be less than or equal to the term code specified for the parameter. Also, the course's end term on SCABASE must be greater than the term code specified.	Term Code Validation Form (STVTERM)
	Subject	No	Enter the subject codes for the subjects you want to include in the extract file.	Subject Code Validation Form (STVSUBJ)
	Course Number (Low)	No	Enter the course number (when combined with the value in the Subject parameter) or the low end of a course range.	
	Course Number (High)	No	Enter the high end of a course range. This value is used in combination with the value entered in the Course Number (Low) parameter.  <b>Note:</b> Since course numbers are character values, specifying a range of 100 - 499 will include values such as 100A, as well as 1012.	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Course Title	No	Enter a value to limit the records included in the extract file to only those courses with similar titles. The process will append a wildcard (%) to the beginning and end of the value.	
	Level	No	Enter the course levels to be included in the extract file.	Level Code Validation Form (STVLEVL)
	Schedule Code Type	No	Enter the schedule types to be included in the extract file.	Schedule Type Code Validation Form (STVSCHD)
	College Code	No	Enter the college codes to be included in the extract file.	College Code Validation Form (STVCOLL)
	Division	No	Enter the division codes to be included in the extract file.	Division Code Validation Form (STVDIVS)
	Department	No	Enter the department codes to be included in the extract file.	Department Code Validation Form (STVDEPT)
	Credit Hours (Min)	No	Enter the minimum number of credit hours a course must be worth or the low end of a credit hour range.	
	Credit Hours (Max)	No	Enter the maximum number of credit hours a course must be worth or the high end of a credit hour range.	
	Course Attributes	No	Enter the course attributes for the courses to be included in the extract file.  If multiple values are specified, the process will treat the relationship between the attributes entered as an OR condition.	Attribute Validation Form (STVATTR)
	Include Attributes	Yes	Enter <i>Y</i> to include course attributes in the extract file, or enter <i>N</i> to not include the attributes. The default is <i>Y</i> .	Yes Include attributes No Do not include attributes

Parameters	Name	Required?	Description	Values
	Limit Course Attributes	Yes	Enter <i>Y</i> to include course attributes in the extract file that are cross-walked on SOAXREF, or enter <i>N</i> to include all course attributes in the file. The default is <i>Y</i> .  <b>Note:</b> Banner values for course attributes must have electronic values defined on SOAXREF.	Yes Include cross-walked attributes No Include all attributes
	Include Course Description	Yes	Enter <i>Y</i> to include course descriptions in the extract file, or enter <i>N</i> to not include the descriptions. The default is <i>Y</i> .	Yes Include descriptions No Do not include descriptions

## Class Schedule Procedures

---

### Create Term Controls

The first step in the schedule building process is to identify the characteristics of the term in which classes are being scheduled. This is done via the Term Control Form (SOATERM) where dates for each session within the term are established and where the Course Reference Number starting number is established for the term.

The next step is to create any exclusion dates when classes are not being held. This is done via the Schedule Exclusion Rules Form (SSAEXCL). A date established on this form will be excluded from the number of meeting times for the section. Vacation days, in-service dates, and breaks in the academic calendar should be maintained on this form. The **Part of Term** field may be used to clearly define those days which are to be excluded from the academic calendar by part of term and calendar year. New exclusion rules for each part of term at the institution must be built by the user. This process may be performed via the Default Part of Term window accessed from the Key Information. This allows exclusion days to be copied from one part of term to another. A description may be added for the excluded days, i.e., 01/18/1994 is a national holiday; 02/18/1994 is an in-service day.

You also have the option to create academic calendar rules based on different calendar types using the Schedule Academic Calendar Rules Form (SSAACRL).

### Creating Instructors

Instructors must first be identified to the system using the General Person Identification Form (SPAIDEN). Once this is completed, they are entered on the Faculty/Advisor Information Form (SIAINST). Here, they may be identified as a faculty member, an advisor, or as both. This process would be completed as an initial task; new hires and terminations would be part of the maintenance process. Once a faculty member is identified on the Faculty/Advisor Information Form (SIAINST) he/she may then be assigned to class sections.

## Building Available Rooms

Buildings must first be defined on the Building Code Validation Form (STVBLDG) and the Building Definition Form (SLABLDG). In order for classes to be scheduled into classrooms, available rooms must first be identified on the Room Definition Form (SLARDEF). This form is used to enter and maintain rooms and their characteristics needed for querying their availability and attributes on the Available Classroom Query Form (SLQMEET).

## Creating Campus Security

If an institution wishes to restrict the class schedule by campus, then the Campus Security User Profile Form (SOAPROF) should be used. Each user may be assigned to a particular campus. Once this is done, the user is restricted from updating any class schedule information not associated with his campus. This is an optional process which may be omitted if class schedule campus security is not necessary.

A function also exists to restrict the access of the schedule and the class roster information to a specific campus by user ID. When campus security is invoked, the user whose access is restricted will only be able to view and modify the schedule and class list information which is associated with their campus. These rules are established on the Campus Security User Profile Form (SOAPROF). A user who is not maintained on this form will have access to all schedule information regardless of campus. This campus security function is used in the Schedule and Registration modules.

## Create Future Term Schedule

The Term Roll Report (SSRROLL) will roll the class schedule forward from one specified term to another specified term. This process has the option of also rolling meeting days, times, and rooms, and block schedule codes and instructors. Instructors will not be rolled if their associated meeting time information is not rolled. This process allows for the initial creation of a specified schedule, then the roll forward will create the next specified schedule at which time any necessary changes can be made to the new schedule. The **CRN Starting Sequence Number** field on the Term Control Form (SOATERM) is updated as each section is rolled. If the job is interrupted prior to completion, the counter will remain in sync with the rolled sections.

The data in the **Projected (Enrollment)** field in the Enrollment Data window of the Schedule Form (SSASECT) rolls to the **Projected (Enrollment)** field for the future term. The actual enrollment from the term being rolled continues to roll to the **Prior (Enrollment)** field in the Enrollment Data window for the future term.

The following represents an example of the fields being updated in the Term Roll Report (SSRROLL).

		<b>Actual</b>	<b>Projected</b>	<b>Prior</b>
199301				
	10002	21	39	0
	10003	11	20	0
<i>- rolled to -</i>				
199502				
	10002	0	39	21
	10003	0	20	11

The Term Roll Report (SSRROLL) uses section restriction rules when rolling data elements from one term to another term. A number of parameters allow the roll of data elements from the Catalog module to the Schedule module. The value of *C* can be used to roll data elements from the course to the section. When a specified parameter is set to *Y*, the data element is rolled from the Schedule module for the term in the From Term parameter to the term in the To Term parameter. When a specified parameter is set to *C*, the data element is rolled from the Catalog module by subject and course, as well as the effective term that is less than or equal to the term in the Roll Term parameter.

The following parameters use the value of *C* to roll data from Catalog:

- Roll Fees
- Roll Degree Attributes
- Roll Text
- Roll Class Restrictions
- Roll College Restrictions
- Roll Fld of Study Restrictions
- Roll Level Restrictions
- Roll Campus Restrictions
- Roll Test Restricts & Pre-reqs
- Roll CAPP Area or DW Pre-reqs
- Roll Degree Restrictions
- Roll Program Restrictions
- Roll Partition Codes
- Roll Room Attributes
- Roll Section Syllabus

- Roll Department Restrictions
- Roll Student Attr Restrictions
- Roll Cohort Restrictions

## Building/Changing Course Sections

After the catalog records are established on the Banner® Student System, course sections are entered into the system for production of the Class Schedule (SSRSECT) and student registration. Sections being offered for a term are built using the Schedule Form (SSASECT). The capacity of the section, and meeting days, times, and rooms, and instructors are assigned using this form.

The Schedule Detail Form (SSADETL) permits the entry of additional information about a course section, including section corequisites, section fees and block codes. The user is permitted to enter only sections where subject and course number have been specified in the Catalog as corequisites for the course. The section corequisite must be a subject of the course corequisite defined on the Course Detail Information Form (SCADETL).

## Meeting Time/Room Assignments

After a course section has been entered in the database, the section may be scheduled into a building and room for specific days and times. The Available Class Room Query Form (SLQMEET), which is accessed from the Schedule Form (SSASECT), will aid in the room scheduling process by finding and displaying available rooms for user days and times specified and that meet specific requirements for capacity, building, and room type. The Building/Room Schedule Form (SSAMATX), which is also accessed from SSASECT, will display the course sections which are scheduled into the building and room based on the user-selected query information.

## Session Creation

Individual sessions for a course section may be defined on the Meeting Time window of the Schedule Form (SSASECT). A session may be used to specify the different meeting time combinations or different schedule types associated with a section. For example, a geology course which has a lecture, a lab, and a field trip may want to create three separate sessions within the course section to further define each of the meeting types. Sessions would not be used to define sections where there are multiple labs to choose from. The link identifiers should be used in these situations.

The **Meeting Time (Code)** field in the Meeting Time window and the **Session Indicator** field in the Instructor window prevent instructors from being attached to non-existent session identifiers and also prevent a non-existent session identifier from being entered in the Instructor window.

If meeting times exist, you may not change the **Part of Term** field unless you first delete the meeting information, then change the **Part of Term** field, and finally re-enter the meeting information. This allows you to change **Part of Term** field without changing the days on which the course is scheduled, and avoids possible room assignment for inaccurate days.

## Duplicate Section Creation

You may duplicate a section on the Schedule Form (SSASECT). When adding a new section of a course, enter the term in the **Term** field for which you would like to add a section and enter *ADD* in the **CRN** field. Use Next Item to open the Default Section Information window. This will default the term code from the **Term** field into the **Default Term** field. This default term code reflects the term from which you would like to duplicate a section. The default term can be changed. Perform a List function from the **Default Term** field to display the Term Code Validation (STVTERM) list of values to view existing term codes.

Move to the **Default CRN** field, where a CRN may be entered, or use Count Query Hits to display the Schedule Section Query Form (SSASECQ) where you can query sections of courses. Select the appropriate CRN to bring back to the **Default CRN** field. After all Key Information has been entered, select the **Process Default** button or use Next Block to duplicate section information. A new CRN is immediately assigned to the newly created course. If you wish to discontinue processing with default data, use the Cancel button or Rollback to close the window and return to the Key Information in SSASECT.

### Note

When duplicating a section, all Key Information fields must be entered. When simply adding a section from scratch, only the **Term** field and **CRN** field must be entered. ■

## Duplicate Section for Same Term

Duplicate sections may be created within the same term; that is, the add term and the default term are the same. When duplicating sections within the same term, the default section number *must be zero*. If the section number is not equal to zero, the section may not be duplicated. Just as when entering a section from scratch on the Schedule Form (SSASECT), if a section exists with the subject, course, or section number, the section may not be entered, and therefore, may not be duplicated. Likewise, when entering a section from scratch, if the section number is zero, the subject, course, or section may be added multiple times to the same term, and therefore, can be duplicated.

When you have successfully duplicated a section within the same term, section information will be duplicated from the forms listed below as follows:

### **From the Schedule Form (SSASECT):**

- All information in the Section portion of the form, with the exception of cross list data and reserved seating, will be duplicated.

- Enrollment data is handled in the following manner:

The following fields are duplicated:

- \* Maximum Enrollment for the Section
- \* Projected Section Enrollment
- \* Waitlist Maximum Capacity

The following fields are set to zero:

- \* Actual Enrollment
- \* Prior Enrollment
- \* Waitlist Actual
- \* Generated Credit Hours
- \* Census One
- \* Census Two

The following fields are set to a value:

- \* Waitlist Remaining is set equal to Waitlist Maximum
- \* Seats Remaining is set equal to Maximum Enrollment
- \* Reserved Seat Indicator is unchecked

- Meeting Time window and Instructor window information is not duplicated.

***From the Schedule Detail Form (SSADETL):***

The following information will be duplicated from the form sections and windows:

- \* Link Section
- \* Section Fees
- \* Degree Program Attribute

The following information will *not* be duplicated from the form sections and windows:

- \* Corequisite Section
- \* Contract
- \* Block Schedule Code

***From the Schedule Restrictions Form (SSARRES):***

All information will be duplicated from the form sections and windows. This includes:

- \* College Restriction
- \* Major Restriction
- \* Class Restriction
- \* Level Restriction
- \* Campus Restriction
- \* Test Score and Prerequisite

***From the Schedule Pre-requisite and Test Score Restrictions Form (SSAPREQ):***

The following information will be duplicated from the form sections and windows:

- \* Test Score Restriction
- \* Prerequisite Restriction

### **Duplication From One Term to a Different Term**

Sections may be duplicated from one term to another; that is, the add term and the default term are different. When duplicating from one term to another, keep the following in mind:

- If the subject/course/section combination already exists for the add term, the section may not be duplicated.
- The subject/course must be within the catalog range according to the Course Base Maintenance Form (SCABASE) for the add term.

For example,                      LAW 415  
  Start Term 199301                      End Term 199401

A section of LAW 415 created for term 199301 could not be duplicated for terms earlier than 199301 or later than term 199401.

- In order to create duplicate sections from one term to a different term, the following information must be valid at the catalog for the add term on the Basic Course Information Form (SCACRSE):
  - The status code for the course must be active.
  - The billing and credit hours for the section must be valid at the catalog.
  - The schedule type for this section must be valid at the catalog.

For example,                      If at the catalog (SCACRSE) for LAW 415,

  From Term 199301                      To Term 199301  
  Credit Hours                              3.00 to 4.00

  From Term 199302                      To Term 999999  
  Credit Hours                              2.50 to 3.00

and a section of LAW 415 is created in term 199301 with 3.50 credit hours specified at the section level, this section cannot be duplicated for term 199302, because the section specified hours are out of the valid credit range. However, if no section specified range had been entered, the section could be duplicated, and the valid credit hour range from the catalog would default to the new section's credit hour range.

- The default section's part of term must be defined on the Term Control Form (SOATERM) for the add term.
- The **CEU Indicator** field on SSASECT will be set to *Y* or *N* according to the catalog for the effective term of the section being added.

- A section may not be duplicated if the Catalog Schedule Restrictions Form (SCASRES) prohibits the creation of sections for either term or campus scheduling restrictions.
- If a grading mode is specified at the section level, and this grading mode is not valid for the add term according to SCACRSE, the default grading mode will be specified for the new section.

When you have successfully duplicated a section within the same term, section information will be duplicated from the forms listed below as follows from one term to another:

- Schedule restrictions on the Schedule Restrictions Form (SSARRES) and schedule detail on the Schedule Detail Form (SSADETL) will not be duplicated at the section level from one term to another.
- If catalog restrictions on the Course Registration Restrictions Form (SCARRES) and/or catalog detail on the Course Detail Information Form (SCADETL) exist for the course, these values will be defaulted for the section, just as they are defaulted when a section is created from scratch.

***From the Schedule Form (SSASECT):***

- All information on the Section area of the form, with the exception of cross list data and reserved seating, will be duplicated.
- Enrollment data is handled in the following manner:

The following fields are duplicated:

- \* Maximum Enrollment for the Section
- \* Projected Section Enrollment
- \* Waitlist Maximum Capacity

The following fields are set to zero:

- \* Actual Enrollment
- \* Prior Enrollment
- \* Waitlist Actual
- \* Generated Credit Hours
- \* Census 1
- \* Census 2

The following fields are set to a value:

- \* Waitlist Remaining is set equal to Waitlist Maximum
- \* Seats Remaining is set equal to Maximum Enrollment
- \* Reserved Seat Indicator is unchecked

- Meeting Time and Instructor information is not duplicated.

## Create Duration Units

Use the Duration Unit Validation Form (GTVDUNT) to create and maintain duration unit codes that are associated with the calculation of an expected completion date for courses and/or sections, such as *SEM* (Semester), *WEEK* (Week), *DAYS* (Days), or *MTHS* (Month). This calendar equivalent must be created to make sure that, regardless of when the learner elects to start the course, they would have the same time frame in which to complete it as other learners registering on different days. This do not reflect attendance hours.

For example, if the learner starts the course on January 1, and the course has a duration of six weeks (where a week equates to seven days), the learner's expected completion date for the course would be the 11th of February. Or, the course has a duration of ten units (where a unit equates to 30 days). Or, the course has a duration of one semester (which equates to x days).

The duration unit code is also used as an alternate method of assessing fees. For example, an institution may require that tuition at a rate of \$50 per week be assessed and charged to the learner instead of an amount that is calculated by credit hours. This type of section level fee assessment could be used for self-paced sections of a course, allowing the learner to *buy* time in the course.

Other courses such as continuing education could also use this method of assessing fees where individual learner progress in a course, rather than static date ranges, is required for refunding purposes without the need to define a proliferation of parts-of-term. Section level refunding rules would control any fee refunds in these instances.

Duration unit codes will only be used when associated with open learning courses in the Schedule Form (SSASECT). The duration units can be established for a course in SCACRSE and will default to the section record when it is created. (An open learning course is characterized by the lack of a part-of-term code in SSASECT.)

- The calendar days information associated with the duration code is used to derive the student's expected completion date, if the learner has selected a start date when registering for the course. Conversely, the student may choose their expected completion date. In this case, the start date will be derived based on the duration days information.
- The units will be associated with the course duration information entered in the Basic Course Information Form (SCACRSE) for those courses that will be available for open learning registration.

This information will be used in tandem with a numeric value representing the number of units (for example, 16 weeks). Duration unit codes cannot be deleted if they have been associated with a course or section.

Some example seed data might be:

Code	Description	Days
WEEK	Weeks	7
MTHS	Months	31

## Create Instructional Methods

Use the Instructional Method Validation Form (GTVINSM) to create and maintain instructional method codes that can be applied to schedule type codes, courses, and/or sections, such as *CLASS* (Classroom based), *TUTOR* (Tutorial), or *WEB* (Web-based). This represents the delivery method of the course content.

An instructional method code can be associated with a schedule type code in STVSCHD or can be used as a standalone description of the content delivery method for the course at the section level. Once an instructional method code has been assigned to a schedule type or section record, it cannot be deleted until all its course and section associations have been removed.

Use the **Instructional Method** field in the Schedule Types window of SCACRSE and on the Schedule Form (SSASECT) to enter the code as a standalone value, with no association with a particular schedule type, or if the code has been previously associated with a course, the code will default and automatically populate the field. The defaulted value may be accepted or updated.

## Open Learning and Class Schedule

Open learning registration provides learners with the ability to register for a class based on start/end dates rather than a term. This open learning approach is optional and works with Banner Student's registration processing for enrollment and administrative purposes.

Open learning allows you to do the following in the Schedule module:

- Run reports using date ranges in place of term.
- Establish de-centralized section level processing rules for registration, extensions, and refunding based on the individual learner's progress in the course versus static dates.
- Expand your fee assessment options using user-defined units (in addition to flat and per credit fees) and registration processing rules.
- Use free-form text to store information for class requirements and display URLs for Web-based courses so students can make informed decisions when selecting the class that best suits their needs.
- Specify section-specific dates when registration is accepted outside of the current parts-of-term defined on SOATERM.

- Define instructional methods for courses.
- Specify the duration of the course for the course and section levels to determine the expected registration completion date for the learner.

## Set up an Open Learning Section

Before setting up an open learning section, make sure all section-related rules and validation codes have been defined in Banner.

1. Access the Schedule Form (SSASECT), and enter the term and then enter *ADD* in the **CRN** field in the Key Block.
2. Use Next Block to access the Section Information block, and enter all applicable information including the subject code and course number.
  - The section will inherit the instructional method assigned to the course when the schedule type is entered or selected. If this association has not been made prior to the creation of the section, you will be required to enter this information for open learning sections.
  - The duration units and number of duration units will automatically be defaulted if they are defined for the course. If they are not defined, you will be required to enter this information for open learning sections.
  - The part-of-term information is not required for open learning courses.
  - The registration from and to dates and start from and to dates are required. If the date record in SOAORUL is defined with the **Override (Indicator)** checked, those dates can be modified in SSASECT.
    - The registration dates default from SOAORUL and represent the period of time a learner may register in this section.
    - The start dates also default from SOAORUL and represent the date range the learner may actually start their course.
    - The census one and census two dates (if defined) will be populated with the corresponding information from SOAORUL.
  - The maximum number of extensions that will be granted to an individual student registered in this section will default to zero and should be changed if the institution's policy permits the extension of the expected completion date.
  - If you are using the contract analysis functionality in the Faculty Load module, the attendance method should be set to a code defined as Independent Studies if the section will not have regular instructor/learner contact hours. Then the instructor will not be penalized in the daily and weekly contact hour calculations. This information is displayed in the main window.
  - The lab, lecture, and other hours information are also displayed in the main window.

3. Save the course. At this time, a CRN is assigned, which replaces the word *ADD* in the Key Block, and the appropriate registration status code, extension and refunding rules will be created for the section and housed in SSARULE. In addition, the Faculty Self Service indicators, used to control the display of midterm grades, final grades, and waitlists, will be created. These checkboxes will be defaulted to allow access and may be changed in the Section Web Controls Form (SSAWSEC).
4. Use the **Detail** button next to the **Registration Dates First** and **Last** fields to view or update the registration status code rules, refunding rules, or extension processing rules which are stored on SSARULE.
5. Use Next Block to access the Meeting Time block to record scheduled meeting times or other scheduled events.
6. It is not mandatory to establish contact times in the Meeting Time block if the section has been deemed to be open learning one (i.e., no part-of-term has been defined).
  - If there is a face-to-face component of the course or an online chat available to students on a regular schedule, enter a meeting code to default in start and end dates, days of the week, and times, or enter the meeting information manually.
  - Also, enter the meeting type for the purpose of the meeting. A meeting type of CLAS will default into the **Meeting Type** field but may be changed to reflect the values housed in the Meeting Type Validation Form (GTVMTYP).

This information appears on the student's hardcopy class schedule or their Web schedule in Banner Student Self-Service. For example, if there are regular chat sessions established for a Web-based course, these can be defined as such and then communicated to the student via their student schedule or via the Web.

7. Save the meeting time information.
8. Use Next Block to access the Instructor block and assign an instructor or tutor to this section.

Due to the fact that the section has been defined as open learning, instructor IDs can be entered without the dependency of meeting time records (for open learning classes only).

9. Save the instructor information.
10. Access the Section Syllabus Form (SSASYLB) using the \*SCHEDULE menu or the Section Syllabus Form item in the Options Menu to enter syllabus information for display on the Web.
  - If syllabus information has already been entered for the course, this information is available to be copied from the Course Syllabus (SCASYLB) to the Section Syllabus (SSASYLB) by selecting the **Copy from Course** button. This button can be found in all blocks of this form. Once the information is copied to the section, it is updatable.

- If no course syllabus information has been stored, you can enter or cut and paste information into any of these fields. These fields will store approximately one and one half pages of text.

11. Access the Schedule Processing Rules Form (SSARULE) to review the defaulted open learning rules.

- If the rule information that defaulted to the section from the Open Learning Section Default Rules Form (SOAORUL) is acceptable, or the information cannot be overridden, the section setup process is complete.
- If no registration status codes, extension rules, or refunding rules were defined in SOAORUL, this information should now be entered to permit registration. All registration processes will verify that the appropriate registration status codes and rules were set up here.
- To enter, update, or delete the extension processing rule, position the cursor on the status code record where **Ext** checkbox is checked, and use Next Block.
- To enter, update, or delete a refunding rule, position the cursor on the appropriate status code record, and use Next Block.

 **Note**

If there is a requirement for all students to start on the same date, the start from/to dates may be set to the same date. For example, in defining a continuing education class with set meeting times, the start dates could be set to the first day of class. In doing so, all the benefits of an opening learning class could be realized (i.e., section level rules) without the requirement to define specific parts-of-term. ■

## Additional Registration Information Table (SFRAREG)

The Additional Registration Information Table (SFRAREG) is used with registration processing. One record for every registration, regardless of the type of section, will be created through the registration processes and will house the start and/or end dates of the registration (the part-of-term start and end dates for traditional sections), and the assigned tutor (the primary instructor for the section).

Also, for the assigned tutor information in SFRAREG, if the primary instructor has been redefined for a section with existing enrollments, the tutor assignment for all students registered in that section is updated to reflect the change. The same change occurs if the primary instructor is removed and a new instructor is assigned.

When a new section is created, a record in the faculty self-service display controls (SSBFSEC) is created with a value of *Y* in the following fields:

- SSBFSEC\_FAC\_WAIT\_LIST\_DISP\_IND
- SSBFSEC\_FAC\_MGRD\_DISP\_IND
- SSBFSEC\_FAC\_FGRD\_DISP\_IND

## Update an Existing Section to be an Open Learning Section

Before updating an existing section to be an open learning section, make sure all section-related rules and validation codes have been defined in Banner.

### Note

The following changes can only be accomplished if there are no existing registration records for the section. It is possible to redefine an existing traditional section as an open learning section. However, the section must be physically deleted when you are redefining an open learning section as a traditional one. ■

1. Access the Schedule Form (SSASECT), and enter the term and CRN in the Key Block.
2. Use Next Block to access the Section Information block, and enter all applicable information including the subject code and course number.
  - An instructional method, registration from and to dates, start from and to dates, duration, and duration units are required to identify this section as available for open learning registration.
  - Remove the existing part-of-term information to ensure that the registration from and to dates will default from the Open Learning Section Default Rules Form (SOAORUL). It may be necessary to delete any meeting time or instructor assignments to accomplish this.
  - Update the **Maximum Extensions** field if extensions are permitted for this section.
3. Save the changes to the section records.
4. Use Next Block to access the Meeting Time block, and add any meeting time records (if required).
5. Save the changes to the meeting time information.
6. Use Next Block to access the Instructor block, and identify the instructor that will be assigned to the registering students as the primary instructor, if there are multiple instructors assigned to the section. The student-tutor allocation process will ignore other instructor records at time of registration.
7. Save the changes to the instructor information.
8. Access the Schedule Processing Rules Form (SSARULE) to add the open learning rules.
  - Open learning section rules should now be entered to permit registration. All registration processes will verify that the appropriate registration status codes and rules were set up here.

- To enter the extension processing rule, position the cursor on the status code record where **Extension** checkbox is checked, and use Next Block.
- To enter a refunding rule, position the cursor on the appropriate status code record, and use Next Block.

## Set Up Non-Open Learning Section

Before setting up a non-open learning section, make sure all section-related rules and validation codes have been defined in Banner.

1. Access the Schedule Form (SSASECT), and enter the term and then enter *ADD* in the **CRN** field in the Key Block.
2. Use Next Block to access the Section Information block, and enter all applicable information including the subject code and course number.

The part-of-term information is mandatory, and an applicable part-of-term number must be entered manually. (The value for part-of-term 1 is not defaulted in.)

3. Save the course. At this time, a CRN is assigned, which replaces the word *ADD* in the Key Block.
4. Use Next Block to access the Meeting Time block to record scheduled meeting times.
5. Enter a meeting code to default in start and end dates, days of the week, and times, or enter the meeting information manually. Also enter the meeting type for the purpose of the meeting. A meeting type of CLAS will default into the **Meeting Type** field but may be changed to reflect the values defined in the Meeting Type Validation Form (GTVMTYP).

This information appears on the student's hard copy class schedule or their Web schedule in Banner Student Self-Service.

6. Save the meeting time information.
7. Use Next Block to access the Instructor block and assign an instructor or tutor to this section.
8. Save the instructor information.
9. Access the Section Syllabus Form (SSASYLB) using the \*SCHEDULE menu or the Section Syllabus Form item in the Options Menu to enter syllabus information for display on the Web.
  - If syllabus information has already been entered for the course, this information is available to be copied from the Course Syllabus (SCASYLB) to the Section Syllabus (SSASYLB) by selecting the **Copy from Course** button. This button can

be found in all blocks of this form. Once the information is copied to the section, it is updatable.

- If no course syllabus information has been stored, you can enter or cut and paste information into any of these fields. These fields will store approximately one and one half pages of text.

 **Note**

SSASECT *will* permit a traditional section to be converted into an open learning section, however, the reverse is not true. ■

## Set Up Section Fee Assessment, Extension, and Refunding Rules for Open Learning Courses

Before setting up section fee assessment, extension, and refunding rules for open learning courses, make sure the term control record has been established in SOATERM, and the required registration date values and registration status codes have been defined in SOAORUL.

1. Create CRNS using the Term Roll Report (SSRROLL) or through the Schedule Form (SSASECT) to default the appropriate registration, extension, and refunding rules to the section.
  - All new open learning sections (those sections defined with no part-of-term), will be populated with section level registration dates. Registration status codes, extension rules, and refunding rules will be defaulted, if they are defined on SOAORUL.
  - This information is defaulted from the Open Learning Rules Form (SOAORUL). The registration from and to dates will reflect the most appropriate registration dates as per section characteristics defined in SOAORUL. These rules are accessible using the new Schedule Processing Rules Form (SSARULE).
  - Modifications to the registration and learner start dates, registration status codes (if defaulted), extension rules (if defaulted), and refunding rules (if defaulted) will be permitted if the original open learning rule has been denoted as overridable.
  - If the status codes and rules have not been set up to default when a new section is created, the registration status codes, at a minimum, will need to be established prior to registration processing. If no extensions are permitted for this section, an extension rule will not be necessary.
2. Establish fee assessment information in the Section Detail Form (SSADETL).
  - If course level fees have been defined in the Course Detail Information Form (SCADETL), they will be defaulted to the section when a new CRN is created. This is also the case if fees are defined in the Section Fees Assessment Control Form (SSADFEE). **Note:** If both are defined, both will default.

- If sections were created before default values were defined in SSADFEE, and this information should be carried over to individual sections, run the Section Fee Population Process (SSPMFEE) to generate fee records.
3. Once established at the section level, the Track by CRN function controlled in the Term Control Form (SOATERM) will add the CRN number to all fee assessment transactions on the student's accounts receivable records, and the Track by Course function will do the same in the refunding process. This capability facilitates the tracking of fees to an individual registration.

## Faculty Assignments

Faculty members can be assigned to sections via the Instructor window on the Schedule Form (SSASECT). Instructors must be created using the previously defined Create Instructors procedures. Instructors may be assigned to multiple sessions or only part of a session using the **Instructional Workload** and the **Percent of Session** fields. The instructional workload value will default from the catalog information but may be adjusted on the Faculty Assignment Form (SIAASGN). When a new section is added to an instructor's schedule via SSASECT, the instructor's default contract type, specified on the Faculty/Advisor Information Form (SIAINST), defaults to the Faculty Assignment Form (SIAASGN).

All information entered in the Instructor window is displayed on SIAASGN, and any assignments entered or updated on SIAASGN will be displayed here.

Instructors who have been inactivated on the Faculty/Advisor Information Form (SIAINST) may not be assigned teaching assignments in the Instructor window of SSASECT. The message *Instructor is not active for this term* is displayed when an inactive instructor is scheduled.

## Maintaining Section Comments

After the course sections have been added to the database, the Schedule Comment Form (SSATEXT) may be used to enter section comments for the production of the Class Schedule (SSRSECT). The comments may also be modified or deleted using this form. These comments may be free-format descriptive text lines for each section requiring a comment.

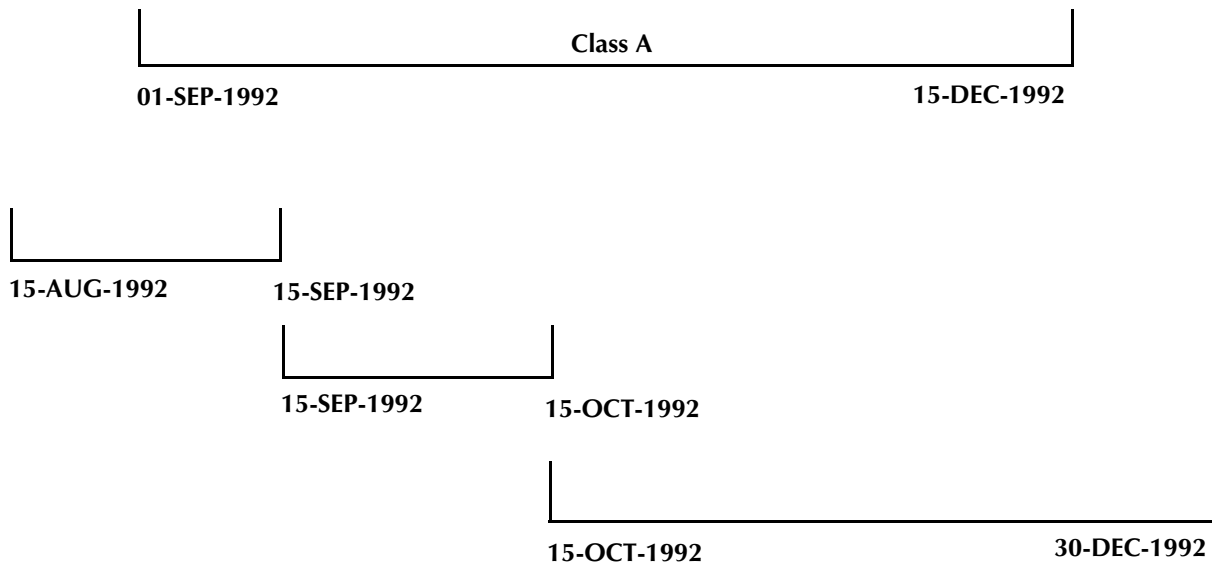

## Reviewing Course Sections

The Schedule Section Query Form (SSASECQ) displays all the sections entered into the system that match user-specified criteria. For example, the user may request to view all sections of ENGL 101 or all sections of ENGL 101 on a particular campus. Enrollment counts and remaining seats are also displayed here. This form may be used to locate the course reference number for a particular section. The **Block Schedule (Indicator)** field is used to indicate that a section is part of a block of courses.

## Reviewing Building/Room Schedule

The Building/Room Schedule Form (SSAMATX) is used to display section information for all sections scheduled into each building and room. The user may specify selection criteria to determine what is displayed. For example: all classes scheduled in East Hall on Mondays, or a list where all English classes are scheduled.

SSAMATX allows for queries to be processed in a flexible, useful manner. In the example below, queries may be performed for a date range for the course, or for the beginning and ending times of the course.

If you have a course which meets from September 1, 1992, through December 15, 1992, it will be returned when any of the above query dates are entered.

16-AUG-1992	16-SEP-1992
16-SEP-1992	16-OCT-1992
16-OCT-1992	30-DEC-1992

For example, if you want to know all meetings scheduled for a room at 8:30, all of the following examples would be returned.

<b>Begin Time</b>	<b>End Time</b>
0800	0900
0830	1000
0800	0930

When entering search criteria for start or end date queries, the following rules hold true:

<b>Rule</b>	<b>Result</b>
If only start date entered:	Retrieves record(s) if SSAMATX date is between SSRMEET start and end dates (inclusive)
If only end date entered:	Retrieves record(s) if SSAMATX date is between SSRMEET start and end dates (inclusive)
If both dates entered:	Retrieves record(s) if SSRMEET start date between SSAMATX start and end dates (inclusive)
	- or -
	SSRMEET end date between SSAMATX start and end dates (inclusive)
	- or -
	SSRMEET start date less than or equal to the SSAMATX start date <i>and</i> SSRMEET end date greater than or equal to the SSAMATX end date

**Example:**

	<b>SSRMEET Start</b>	<b>SSRMEET End</b>
1	01-Jan-1999	31-Jan-1999
2	05-Jan-1999	28-Jan-1999
3	01-Feb-1999	28-Feb-1999
4	01-Mar-1999	31-Mar-1999
5	31-Mar-1999	30-Jun-1999
6	01-Mar-1999	01-Mar-1999

SSAMATX Start Entered	SSAMATX End Entered	Records Retrieved
01-Feb-1999		record 3
15-Feb-1999		record 3
15-Jan-1999		records 1, 2
01-Jan-1999	01-Mar-1999	records 1, 2, 3, 4, 6
01-Mar-1999	01-Mar-1999	records 4, 6
01-Dec-1998	01-Feb-1999	records 1, 2, 3

#### Note

The same logic applies to the time searches. ■

## Producing a Schedule of Classes

After the course schedule information has been entered into the system, the Class Schedule Report (SSRSECT) may be produced. The Class Schedule lists all course section information required for the registration process, including the title, meeting days and times, and instructors. It is used by students and advisors in the registration process for the upcoming term.

## Reviewing Enrollment Counts

The Schedule Section Tally Report (SSRTALY) may be used to review past enrollments in sections to aid in the determination of current capacity and may also be used to verify current enrollment counts during and following registration. The report is able to show the maximum, actual, and remaining waitlists for enrollment, as well as census two counts and blocks associated with a CRN.

## Schedule Contact Hours

The information in the **Contact Hours** field in the Section information of the Schedule Form (SSASECT) defaults from the **Contact** field on SCACRSE. Scheduling contact hours is defined for a term as follows:

- A Meeting Period is a pattern of days and meeting times within an established Start Date and End Date.
- A Session is made up of one or more Meeting Periods.
- A Section is made up of one or more Sessions, as in the example below.

*Example:* Section 10001 - ENGL 100

Session 1	Meeting Period 1	MWF	8:00 - 8:50	29-AUG-1992	20-DEC-1992
Session 1	Meeting Period 2	TR	9:00 - 10:15	29-AUG-1992	20-DEC-1992
Session 2	Meeting Period 1	MWF	1:00 - 1:50	29-AUG-1992	20-DEC-1992

The data used for scheduling contact hours is as follows:

- A Meeting Period Number.
- B Days of the Week for the Meeting Period.
- C Start Time and End Time of Meeting Period (in military time).
- D Starting Date of the Meeting Period. (This is not necessarily a Monday or Tuesday.)
- E Ending Date of the Meeting Period. (This is not necessarily a Thursday or Friday.)
- F Number of Days of the Week (B) that fall within the Start Date (D) and End Date (E) of the Meeting Period.

<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>	<b>E</b>	<b>F</b>
Meeting Period 1	MWF	8:00 - 8:50	29-AUG-1992	20-DEC-1992	48
Meeting Period 2	TR	14:00 - 16:00	29-AUG-1992	20-DEC-1992	32
					80 days total

**1992 Calendar**

	<b>U</b>	<b>M</b>	<b>T</b>	<b>W</b>	<b>R</b>	<b>F</b>	<b>S</b>
<i>AUG</i>							29
	30	31	01	02	03	04	05
<i>SEPT</i>	06	07	08	09	10	11	12
	13	14	15	16	17	18	19
	20	21	22	23	24	25	26
	27	28	29	30	01	02	03
<i>OCT</i>	04	05	06	07	08	09	10
	11	12	13	14	15	16	17
	18	19	20	21	22	23	24
	25	26	27	28	29	30	31
<i>NOV</i>	01	02	03	04	05	06	07

	08	09	10	11	12	13	14
	15	16	17	18	19	29	21
	22	23	24	25	26	27	28
	29	30	01	02	03	04	05
<i>DEC</i>	06	07	08	09	10	11	12
	13	14	15	16	17	18	19
	20						

For the Exclusion Rules Form (SSAEXCL) for the year 1992:

Monday	November 23, 1992	Falls in Meeting Period 1
Tuesday	November 24, 1992	Falls in Meeting Period 2
Wednesday	November 25, 1992	Falls in Meeting Period 1
Thursday	November 26, 1992	Falls in Meeting Period 2
Friday	November 27, 1992	Falls in Meeting Period 1

On the Schedule Calendar Form (SSAACCL), the **Number of Weeks** field is calculated by using the earliest Meeting Period Start Date (D) and the latest Meeting Period End Date (E) to determine the actual Number of Days in the entire section. (This is the second **Number of Weeks** field in the Schedule Academic Calendar section.) The Exclusion Rules Form (SSAEXCL) is not checked for this calculation.

$$114 \text{ Actual Meeting Days} / 7 \text{ days in a week} = 16.28 \text{ weeks}$$

## Section Contact Hours

The Total Section Contact Hours figure is calculated in the **Total Contact** field of the Faculty Instructional Assignment section on the Faculty Assignment Form (SIAASGN). The equation is as follows:

$$\begin{aligned} & [(\text{Total Meeting Period Days of the Week} - \text{Exclusion Rule Days for Meeting Period}) \\ & = \text{Number of Meeting Period Days} * \text{Number of Minutes in Meeting Period}] / \\ & \text{Duration factor} = \text{Number of Meeting Period Contact Hours} \end{aligned}$$

Example:

$$\begin{aligned} [(48 - 3 = 45) * 50] & = 2250 \text{ min}/50 = 45 \text{ Contact Hours for Session 1} \\ [(32 - 2 = 30) * 120] & = 3600 \text{ min}/50 = 72 \text{ Contact Hours for Session 2} \end{aligned}$$

$$\text{Total Section Contact Hours is } 45 + 72 = 117$$

## Section Weekly Contact Hours

The Section Weekly Contact Hours figure is calculated in the **Weekly Contact** field of the Faculty Instructional Assignment section on the Faculty Assignment Form (SIAASGN). The equation is as follows:

(Number of Days in a Meeting Period Week \* Number of Minutes per Meeting Period) /  
Duration factor = Meeting Period Weekly Contact Hours

$$(3 * 50) / 50 = 3.0$$

$$(2 * 120) / 50 = 4.8$$

The sum of all Meeting Period Weekly Contact Hours = Section Weekly Contact Hours

$$3.0 + 4.8 = 7.8$$

## Creating Cross List Definitions

If the institution will be establishing cross-listed sections, the cross list group identifiers which will be used must be created on the Schedule Cross List Definition Form (SSAXLST). The maximum enrollment for the cross list is also specified on this form. SSAXLST uses the **Block (Code)** field to indicate that a section is part of a block of courses.

After creating cross list group identifiers, these identifiers must be entered in the **Cross List** field of the Schedule Form (SSASECT) for the appropriate courses. If cross-listed courses are to be scheduled for the same room during the same time, one method to accomplish this would be to assign meeting days, times, rooms, and instructors to one of the cross-listed courses and save this data in the Schedule Form (SSASECT).

To quickly schedule the other cross-listed courses to the same room, enter SSASECT for each of the remaining cross-listed courses, and use Duplicate Item to access the Cross List Meeting Time/Instructor Query Form (SSAXMTI) from the Meeting Time window. This form displays the meeting time and instructor information already associated with the cross-listed group of courses.

You will see the room, time, and instructor information added previously via SSASECT for other sections. Place your cursor in the **CRN** field of the course with previously added schedule information. Use Select to default the meeting dates, days, times, rooms, and instructors into SSASECT with the *O* value (both time and room conflict) in the **Override Indicator** fields in the Meeting Time and Instructor windows.

Save your records. They are automatically posted. Meeting time and instructor information can also be added manually for each course, and overrides will need to be requested to schedule the same rooms and instructors for the course.

 **Note**

It is not necessary to schedule the cross-listed courses in the same room or with the same instructor. ■

## Schedule Module Links

In the Banner Student System there are two methods of scheduling courses that must be taken concurrently, corequisites and links.

### Corequisites

Corequisites are two or more different courses that must be taken concurrently. Corequisites are set up in the Catalog module by identifying the courses as corequisites of each other in the Corequisite Course section of the Course Detail Form (SCADETL) for each of the courses required.

Example 1:

ARTS 201 and ARTS 210 must be taken concurrently.

SCADETL:	<i>Key Information</i>	<i>Corequisite information</i>
	ARTS 201	Subject: ARTS Course: 210
	ARTS 210	Subject: ARTS Course: 201

If a specific section of a course is required as a corequisite, then that section must also be identified in the Corequisite Section information of the Schedule Detail Form (SSADETL).

Example 2:

ARTS 201-01 and ARTS 210-10 must be taken concurrently.

SSADETL:	<i>Key Information</i>	<i>Corequisite Section information</i>
	ARTS 201 01 CRN	Subject: ARTS Course: 210 Section: 10
	ARTS 210 10 CRN	Subject: ARTS Course: 201 Section: 01

### Link Processing

Links are used to connect sections of the same course when it is required that some combination of these sections be taken concurrently. Linking sections requires defining link identifiers on the Schedule Form (SSASECT) and defining link connectors on the Schedule Detail Form (SSADETL). Both link identifiers and link connectors are two-byte characters which are user-defined.

In each of the following examples, the linking process places a link connector on a section of a course and uses that same value as the link identifier on another section of the same course. This action links the section with the connector to the section with that identifier. It will create an error message at registration, should a student try to register for the section with the connector, without registering for the section with the identifier of equal value. (This error message is dependent upon **(Registration) Links** error checking being set to Fatal on the Term Control Form (SOATERM) for the term.)

The following courses will be used in the examples of linking sections in various combinations:

Course	Section	Title	Schedule Type	Credits
Chemistry 120	001	Chemistry I	Lecture	4
Chemistry 120	002	Chemistry I	Lecture	4
Chemistry 120	003	Chemistry I	Lab	0
Chemistry 120	004	Chemistry I	Lab	0

**Example 1:**

Students may take a lab section without a lecture section, but not a lecture section without a lab section (any lab section).

Note that for this combination, no connector is placed on the lab sections, and no identifier is required on the lecture sections.

Course and Section	Link Identifier (SSASECT)	Link Connector (SSADETL)
120-001		L1
120-002		L1
120-003	L1	
120-004	L1	

**Example 2:**

Students may take a lecture section without a lab section, but not a lab section without a lecture section (any lecture section).

Note that for this combination, no connector is placed on the lecture sections, and no identifier is required on the lab sections.

Course and Section	Link Identifier (SSASECT)	Link Connector (SSADETL)
120-001	A1	
120-002	A1	
120-003		A1
120-004		A1

### Example 3:

Students may take any lab section with any lecture section, but must have both a lab section and a lecture section.

Note that for this combination, all lecture sections have the same identifier, and all lab sections have the same identifier.

Course and Section	Link Identifier (SSASECT)	Link Connector (SSADETL)
120-001	A1	L1
120-002	A1	L1
120-003	L1	A1
120-004	L1	A1

### Example 4:

Students in section 001 Lecture must take section 003 Lab, and students in section 002 Lecture must take section 004 Lab.

Note that for this combination, the identifiers are unique values for each section of the lectures and each section of the labs.

Course and Section	Link Identifier (SSASECT)	Link Connector (SSADETL)
120-001	A1	L1
120-002	A2	L2
120-003	L1	A1
120-004	L2	A2

When creating sections, each section must be defined as gradable (**Gradable** box is checked) or non-gradable (**Gradable** box is unchecked) on SSASECT. If the lab and lecture sections are one course and are graded as one course, then one of the sections, either the lab or the lecture, must be defined as non-gradable, and the credit hours/billing hours must be changed to zero (0).

In order to change the credit hours and billing hours for a course at the section level, the credit and billing hours at the catalog level must have been defined for variable credit, 0 or 3 credits, for example. This range will default on SSASECT when the section is created, and the user can then define the lecture section, to follow the example, as offered for 3 credits. The lab section would be defined as available for zero (0) credits to avoid duplicate credit and billing for the same course.

## Create Section Contract Information

The Schedule Detail Form (SSADETL) allows the user to designate a section as a contract section via the Section Contracts information on the Contract/Block Schedule Code window. Examples of contract codes may be military contract, IBM contract, AICPA

contract, etc. The contract information is repeating. Therefore, multiple contract codes may be listed for a section. The **Percentage** field is also provided to designate the contract breakdown. The **Primary Indicator** designates the primary contractor if multiples exist. No processing is performed with the information.

The following is an example of contract information: ELEC 121, Electrical Wiring, is a contract course in the Continuing Education Division which is funded 80% by the Electricians Union for their apprentices. The other 20% is funded by the Continuing Education Division.

The Section Contracts information could be set up as follows:

EU	Electricians Union	80%	<b>Primary</b> - checked
CE	Continuing Education	20%	

## Creating/Modifying Restrictions on Sections

When a course has been added to the system, restrictions as to who may register for the course are built on the Course Registration Restrictions Form (SCARRES). When sections of a course are added for a term, any restrictions set at the catalog level will default to the sections at the schedule level. These restrictions are maintained on the Schedule Restrictions Form (SSARRES) and may be added to or otherwise modified for the Key Information. Please see the “Catalog Procedures” section for further information and examples of setting restrictions.

### Note

Course and section restriction rules created prior to Release 8.0 are handled as follows. The **(Field of Study) Type** field on SCARRES and SSARRES will be set to a default of *MAJOR* when a current course or section restriction rule exists for a major (STVMAJR). Since only the field of study type of *MAJOR* was previously considered, all registration restriction rules will function as before. Processing checks the primary and secondary curriculum elements. ■

You may restrict a course to include or exclude students specifically by:

- department,
- field of study (major),
- class,
- level,
- degree,
- program,
- campus,
- college,

- student attribute, and
- cohort.

The restriction controls are used to enter and maintain the restriction indicators associated with the restrictions for a course. The only values that can be selected in the **Include Exclude** radio groups are *Include* for include restrictions and *Exclude* for exclude restrictions. An inclusion restriction means a course may be offered only for the values displayed for that restriction. An exclusion restriction prohibits the offering of a course for the specified restrictions.

The **All Field of Study Types** checkbox is used to indicate that all field of study types should be considered. When this box is checked, the **Type** field is inactive, and the user is taken to the **Code** field to select the field of study value.

The **(Field of Study) Type** field displays the code of the learner field of study type, such as *MAJOR*, *MINOR*, *CONCENTRATION*. Values are selected from the Learner Field of Study Type (GTVLFST) list.

Please refer to the “Building Registration Restrictions on Courses” section of the “Catalog Chapter” for more information on using the **All Field of Study Types** checkbox and the **(Field of Study) Type** field.

## Test Score Restrictions and Prerequisites

Use the Schedule Pre-requisite and Test Score Restrictions Form (SSAPREQ) to restrict sections for test scores and area prerequisites. Restrictions set at the course level on the Catalog Pre-requisite and Test Score Restrictions Form (SCAPREQ) will default to the schedule prerequisite and test score restriction information maintained on SSAPREQ. These restrictions may be added to or otherwise modified on SSAPREQ. Please see the “Catalog Procedures” section for further information and examples of setting prerequisite and test score restrictions.

## Course Fee Assessment Rules by Level

A **Level** field exists in the Section Fees information on the Schedule Detail Form (SSADETL). The Section Fee Assessment Control Form (SSADFEE) allows an institution to build fee assessment rules on a term basis for sections based on schedule type and level. Once these section assessment rules have been built, they will default to the section based on the schedule type of the section and the level entered in the Section Fees information in the Section Fees/Degree Program Attribute window of SSADETL. The **Tuition and Fee Waiver** checkbox on the Schedule Form (SSASECT) must be checked, and the **Override** checkbox on the Registration Fee Assessment Rules Form (SFARGFE) must be checked, if regular fee assessment processing is to be bypassed for this section.

When this section fee assessment process is used, the system stores the course reference number with the account detail information generated for the section. This will allow the institution to use the Tuition & Fee Analysis by Course View (SFVTFAN).

## Tuition & Fee Analysis by Course

You have the ability to monitor the tuition income for those sections which were assessed using course fee assessment rules by level. An Oracle view (SFVTFAN) is provided which contains the information necessary to report this tuition income.

Fields in the view include: Term, CRN, Subject, Course Number, Sequence Number, Detail Code, Detail Code Category, Admissions Type, Degree Code, Course Level, Registration Status Code, Course Title, Primary Instructor Name, Transaction Number, and Amount.

## Tuition Fee Waivers

To indicate that a section should not have the customary tuition and fee charges, check the **Tuition and Fee Waiver** box on the Schedule Form (SSASECT). This will indicate to the system that this section is exempt from tuition and fees which are overrideable as defined on the Registration Fees Process Control Form (SFARGFE), when the **Override** box is checked. If this box is checked, all rules on SFARGFE which are overrideable will ignore billing hours for this section during registration fee assessment. If this box is not checked, all rules on SFARGFE apply.

If it is determined by your institution that a fee other than the customary tuition and fees should be charged for this course, this is accomplished by checking the **Tuition and Fee Waiver** box in conjunction with assigning a section fee on the Schedule Detail Form (SSADETL). When assigning a fee code, an amount also needs to be entered. A flat fee or a per credit hour fee may be charged. This determination must be made by the institution when entering the fee code.

For a section, a level may also be specified for a fee. This level specifies the level at which the course is taken. This allows for differing fees or additional fees to be charged, if the section is taken at different levels. If no level is specified, the rule will apply to all levels. If tuition fee waiver rules had been defined at the catalog level, these rules will default to the section for all levels (level is null). These defaulted catalog rules may then be modified for each section as needed.

### Note

Once a waiver has been created for a section and enrollment has begun, the setting of the **Tuition and Fee Waiver** box should not be changed, so that fees are assessed correctly. ■

This flag is not dynamically looked at in the registration fee assessment process. Therefore, if a section has a waiver and a student registers for the course, they will be given a waiver. However, if at a later date the setting of the **Tuition and Fee Waiver** box

is changed, even if this student is re-processed via registration fee assessment, they may not be charged correctly, because the **Tuition and Fee Waiver** box has already been populated.

## Reserved Seating

Reserved seats rules are established in the Reserved Seats window of SSASECT after enrollment information for non-reserved seats has been created for the section. You can reserve a group of seats in a section for a particular group of students. Reservations can be defined using curriculum and student components, including the primary and secondary curriculum. Admission, matriculation, and graduation terms are included. The user ID and activity date are displayed for each rule. Reserved and waitlist totals are also displayed.

Reserved seat rules processing checks the curriculum data elements against SORLCUR and SORLFOS. Student attributes are checked against SGRSATT. Cohort data is checked against SGRCHRT. The admission and matriculation terms are checked against SORLFOS. The graduation term is checked against SGBSTDN.

Overflow checking is used during processing to check unreserved available seats when seats on the reserved rule are full. Students can register for those unreserved available seats when overflow checking is turned on.

Values can be entered in the data elements for the rules, but once a rule has been saved, it cannot be changed. The rule must be deleted and re-entered. The **Overflow** checkbox can be checked (set to *Y*) or unchecked (set to *N*) as needed. The **Reserved Maximum** and **Waitlist Maximum** fields can also be modified by rule, for reserved or non-reserved seating. When waitlist maximums have been set up, the waitlist messages, which are displayed at registration, will reflect that this section has reserved seating in place.

The Reserved Seats Inquiry Form (SSIRESV) is used to query and review reserved seats rules for a term and CRN combination. This form can be accessed from the Options Menu on SSASECT.

## When a Student Meets Multiple Rules

The reserved seats process will attempt to place the student in the most restrictive rule that applies. The most restrictive rule is considered the rule with the most reserved rule components. If the student meets rules with the same number of reserved rule components, left-most components are considered most restrictive. If a student meets multiple reserved seats rules that are equally restrictive, an attempt is made to place the student in the reserved rule the process finds first.

### ***For example:***

If a student meets rule 1 with a level of *UG* and rule 2 with an attribute of *AI*, the student will be placed in rule 1.

If a student meets rule 1, where rule 1 has three data elements, and the student also meets rule 2, where rule 2 has three data elements, the student will be placed in the rule with the three elements that are listed left-most in the rule.

Once the process makes a hit, and the most restrictive rule is found for the student, the student will be placed in the reserved seats bucket, if seats are available in that rule. The reserved seats process does not check for additional restrictive rules for which the student may apply.

Reserved seats processing does not consider the *value* of the components, rather the *quantity* of components and/or the *location* of the components. The exception is curriculum components. See additional information regarding curricula hierarchy, below.

When the student meets a rule, that student is placed in the reserved seat or waitlist bucket for the rule when available seats exist. If no reserved seats are available in the most restrictive rule for which the student qualifies, the system looks at the setting of the **Overflow** checkbox.

- When the **Overflow** checkbox is unchecked (*N*), the student is not allowed to register for the course.
- When the **Overflow** checkbox is checked (*Y*), the student can register for an unreserved available seat in the course.
- When no unreserved available seats exist, the student is not allowed to register for the course.

The components for the reserved seats rule are checked in order as they appear in the Reserved Seats window. Rules are checked moving from left to right, and the data elements that appear to the left carry more weight on the rule.

## Curricula Hierarchy

The **Curricula** field is the exception to the above information. This field is used to determine which of the student's curriculum records should be checked against the reserved rule. When curriculum components are considered, the following hierarchy is used:

- *Any* or null curricula are considered first.
- *Primary* curriculum is considered second.
- *Secondary* curriculum is considered last.

### **For example:**

When the student meets multiple rules based on curriculum components, the student is placed in the rule where the curriculum components are considered first. In the example below, the student would be placed in the first rule with the **Curricula** field set to *NULL* or *Any*.

Level	Field of Study Type	Field of Study Code	Curricula	Attribute	Matriculation Term
UG	MAJOR	MATH	Null or Any	A1	200510
UG	MAJOR	ENGL	Primary	A2	200510

## Rule Data Entry

Data entry of rules must be considered so that rules are valid and can be saved. Duplicate reserved rules cannot be saved. Please note that the **Curricula** field is not considered when determining equality. Therefore, the following rules are considered duplicates and will generate an error message. Only one of the following rules can be successfully saved.

Program	Field of Study Type	Field of Study Code	Curricula
BA-MATH	MAJOR	MATH	Primary
BA-MATH	MAJOR	MATH	Secondary

Here is another example of duplicate rules. Only one of the following can be saved.

Department	Field of Study Type	Field of Study Code	Curricula
	MAJOR	MATH	Null
	MAJOR	MATH	Any

## Reserved Seats Rules Totals

Reserved seats rules totals are displayed separately in the Reserved Seats window. These numbers are the totals for all the rules for the CRN. As the maximum reserved seats and maximum waitlist seats values are modified by rule, the totals will automatically be updated and displayed. These fields are display only.

The totals in the Reserved Seats window reflect the totals from the Enrollment Data block. Use the **Delete Reserved Seats** button to delete all reserved seats rules if each reserved rule has zero (0) actual seats taken. This removes all the reserved seating information and returns the enrollment data to the section level.

### Note

The system tests for reserved seating each time the Reserved Seats window is entered. You can only delete reserved seating when no enrollment exists for the reserved seating. When enrollment exists that meets the reserved seating requirement, you will not be allowed to delete reserved seating. ■

## Overflow Rule Option

The **Overflow (Indicator)** checkbox in the Reserved Seats window is used to check unreserved available seats when seats on the reserved rule are full. Students can register for those unreserved available seats when overflow checking is turned on. When a student meets a reserved rule for which no reserved seats are available and the **Overflow (Indicator)** is checked (set to *Y*), an attempt is made to place the student in a non-reserved available seat and successfully register the student for the course. If there are no non-reserved available seats, processing will use the reserved rule and issue capacity messages as usual.

When the **Overflow** checkbox is checked (set to *Y*), students who met a reserved rule but could not register because the maximum reserved seats value had been met are able to register for unreserved available seats. The overflow processing works as follows:

- When the **Overflow** checkbox is unchecked (*N*) and no reserved seats are available, the student is not allowed to register for the course. The reserved rule is used to issue capacity messages.
- When the **Overflow** checkbox is checked (*Y*) and no reserved seats are available, the student can register for an unreserved available seat in the course. The overflow option is allowed. The reserved rule is deactivated so that unreserved available seats can be used by students who would have normally met the reserved seats rule.
- When the **Overflow** checkbox is checked (*Y*) and no reserved seats are available and no unreserved available seats exist, registration processing will go back and use the reserved rule to issue associated capacity messages.
- When reserved seats rules are initially created, the **Overflow** checkbox is unchecked (*N*).
- The **Overflow** checkbox can be activated or inactivated at any time during registration.
- The **Overflow** checkbox *cannot* be activated for the unreserved rule.
- When seats are full for reserved and/or unreserved rules and the student who meets a reserved rule is waitlisted, the student is waitlisted for the rule in which the requirements are met, whether the **Overflow** checkbox is checked or unchecked.
- When the **Overflow** checkbox is checked (*Y*), it is used, regardless of the setting of the **Capacity** section option in SOATERM.

### Note

The reserved seats rule overflow option is also used by Waitlist Automation processing. If a seat becomes available on the non-reserved rule, then all students waitlisted in that rule and in reserved rules with the **Overflow** checkbox checked (*Y*) are treated as a single waitlist, and the student with the highest priority is notified.

Please note that the setting of the **Overflow** checkbox is not considered when the system attempts to waitlist a student. If a student meets a

reserved rule where the waitlist is full and the **Overflow** checkbox is checked (Y), the student will not overflow into the waitlist on the non-reserved rule. ■

## Querying Reserved Seats

The Reserved Seats Inquiry Form (SSIRESV) is used to query and view all reserved seats rules for a term and CRN combination. Rules are displayed in their entirety, and multiple rules are displayed for a section. This form can be accessed from the Options Menu on SSASECT.

Queries are based on the **Term** and **CRN** fields in the Key Block. The Data block displays the rules that are returned by the query for the term and CRN. Rule data elements are also queryable. Rule components are displayed in the same order as in the Reserved Seats window on SSASECT. The fields in the Reserved Seats Totals block are display only.

## Rolling Reserved Seats

The Term Roll Report (SSRROLL) rolls the data elements from SSASECT (Reserved Seats window) when reserved seats are rolled to a new term. The setting of the **Overflow** checkbox for the rule is also rolled to the new term. The optional `sussrresv.sql` script is used to set the **Overflow** checkbox to checked (Y) or unchecked (N) for all CRNs for a term. The overflow options can be reset using the delivered script or can be updated manually after the roll has been performed.

### Note

When SSRROLL is run and the SSRRESV records are created for the new term, the user ID for the user that runs SSRROLL will be the user ID that populates the new SSRRESV records. ■

## Reserved Seats Rules Script - srssrresv.sql

The `srssrresv.sql` PL/SQL script is used as a report. When run, it selects all reserved seats rules by term and CRN. The script resides in the SQL\*Plus directory.

The script uses the following prompts:

- Term (Required) - Enter the term for the reserved seats rule.
- CRN (Optional) - Enter the CRN for the reserved seats rule.
- Date (Optional) - Enter the date the report is being run.

The output includes:

- Report Name
- Date
- Term Code

- CRN
- Subject
- Course Number
- Enrollment Detail (seat counts) for the CRN
- Reserved Rules detail, including the **Overflow** checkbox setting associated with each rule
- Reserved Detail (seat counts for the rule)

The output pages break on the CRN and print the sum of the seat counts for each CRN, based on the rules for the CRN. The display order of the rules within a term and CRN follows the sort order of the fields that make up the rule from left to right.

## Converting Existing Reserved Seats Rules

Prior to this Release 8.0, reserved seats rules were constructed using level, major, and class. Only the primary curriculum was checked during registration processing to determine which reserved seat rule was met by the student. During the upgrade to Banner Student 8.0, existing reserved seat rules will be converted as follows, to ensure that all rules function as they did in the previous release.

- Reserved seat components will be set to null.
- The **Overflow** checkbox will be unchecked (*N*). (An optional script is delivered to set the **Overflow** checkbox to checked (*Y*) or unchecked (*N*) for all CRNs for a term.)
- If an existing rule contains a major value (STVMAJR), the **Field of Study Type** field will be set to *MAJOR*, and the **Field of Study Code** field will be populated with the existing major value.
- If the **Majr** field (now the **Field of Study Code** field) is null in the existing reserved rule, both **Field of Study Type** and **Field of Study Code** will be set to null.
- If an existing rule contains a level or a major, the **Curricula** field will be set to *Primary* to preserve prior registration processing that only checked the primary curriculum.
- If an existing rule used only class, the **Curricula** field will remain null.

## Maintain Academic Calendar

The academic calendar processing records and calculates the significant academic calendar dates for a group of sections or a specific section.

### Note

The academic calendar processing is an optional portion of the Schedule module which does not need to be implemented unless it is required. ■

Creating codes on the Academic Calendar Type Validation Form (STVACCL) is the first step in establishing the academic calendar. These academic calendar type codes are user-defined. Examples are: daily contact, weekly contact, CEU, or semester calendar.

The Schedule Academic Calendar Rules Form (SSAACRL) may be used to build the rules associated with an academic calendar. Once academic calendar rules are built, they may be copied to another academic calendar type within the same term via the **Default Type** field in the Default Calendar Type window.

The academic calendar contains an optional census two date. The **Census Two Date** field is also on the Term Control Form (SOATERM) in the Base Part of Term section. If census two is entered here, it will default to the Census Two information on the Schedule Form (SSASECT). A census two enrollment will automatically be maintained if a census two date is specified.

The information included in an academic calendar includes census one, census two, enrollment date, record academic history date, and drop without a penalty date. There are three fields associated with each of these rules: **Numbers of Days**, **Percentage of Days**, and **Date**. The user may choose a specific date or have the system calculate the date when the number of days or percentage of days is used. If number of days or percentage of days is specified, then the system will automatically calculate the correct dates when an academic calendar type is associated with a section. These three fields work in conjunction with one another. If a census one date is entered, then the number of days to census one and percentage of days to census one may not be entered.

The **Census One Date** and **Census Two Date** fields are used in processing the registration information to calculate the census one and census two enrollment. The last day to enroll, the last day to record academic history, and last day to drop without a penalty are informational only and are not currently used in any process.

The Academic Calendar Rule Query Form (SSAQCR), which is a stand alone query form, may be used to view the academic calendar types for which rules are established for the term.

The Schedule Calendar Form (SSAACCL) allows you to tie an academic calendar to a section. The keys to the form are term and course reference number. Once a calendar type is entered, this form examines the session meeting information from the Schedule Form (SSASECT) and calculates the academic calendar information. An academic calendar type may only be added or modified prior to enrollment existing for the section. This is

because a change in the census dates after enrollment exists would give an inaccurate census enrollment count.

The dates on the Schedule Exclusion Rules Form (SSAEXCL) are excluded from the academic calendar calculations. The **Part of Term** field in the Key Information of SSAEXCL allows the institution to define those days which are to be excluded from the academic calendar by parts of term and calendar year. A description may also be added for the excluded days.

The Academic Calendar Type is included in the Section Roll Process (SSRROLL) to roll the academic calendar information forward to the next term being processed.

Academic calendar types may only be associated with those sections whose part of term allows override capabilities of start, end, and census dates on the Term Control Form (SOATERM).

 **Note**

The academic calendar information on the Schedule Calendar Form (SSAACCL) cannot be deleted with a Remove Record function. ■

The following is an example of academic calendar processing. An academic calendar rule of daily contact is established on the Schedule Academic Calendar Rules Form (SSAACRL) for 199301 (Fall 1992) as follows:

	<b># Days</b>	<b>% Days</b>	<b>Date</b>
Census One:	10		
Census Two:		50%	
Enrollment:	20		
Record Academic History:			10-NOV-1992
Drop Without Penalty:	35		

This rule is given to a section which meets Monday, Wednesday, and Friday, from August 29th till December 15th. Monday, September 7th, Thursday, November 26th, and Friday, November 27th, have been defined as exclusion days on the Schedule Exclusion Rules Form (SSAEXCL) for this section's part of term. Therefore, they are not used when calculating the academic calendar dates.

When you examine all the Mondays, Wednesdays, and Fridays which fall between August 29th and December 15th, and remove the two exclusion days that follow Monday, Wednesday, or Friday, you can determine that there are 44 actual meetings of this section. Using the rules established on SSAACRL the dates calculate as follows:

Census One 10 Days	23-SEP-1992
Census Two 50% Days	21-OCT-1992

### Registration Dates:

Last Date to Enroll	16-OCT-1992
Last Date to Record Academic History	10-NOV-1992
Last Date to Drop without Penalty 35 Days	20-NOV-1992

The Registration Dates are informational only. ■

## Maintain Attendance Accounting Method

The **Attendance (Accounting) Method** field on the Schedule Form (SSASECT) is validated against the Attendance Accounting Method Validation Form (STVACCT). This validation form allows the user to specify the accounting method for the section. Examples are weekly, daily, independent study, or actual. Only one method may be specified on the validation form.

Both the Daily and Weekly Contact Hour calculations use the number of hours per week when the session meets. The **Hours Per Week** field in the Meeting Time window is updateable. This allows those sessions which do not meet for the standard duration factor, and are maintained on the Faculty Load Term Control Form (SIATERM), to be updated to reflect the correct hours of meeting per week.

In the meeting times listed below, the system, using a 50 minute duration factor maintained on SIATERM, would calculate 4.4 and 4.8 hours per week. Due to break periods, the institution only gives 4 hours of meeting time per week to the three examples. To correctly specify the number of hours per week for these special sessions, the override on SSASECT may be used.

		<b>System Calculated</b>	<b>Override Value</b>
TR	0800 - 0950	4.40	4.00
TR	0810 - 1000	4.40	4.00
TR	0800 - 1000	4.80	4.00

Number of Weeks in the Session is calculated using the earliest session start date and the latest session end date.

When a weekly attendance accounting method is specified on a section with multiple meeting times, the value appearing in the **Weekly Contact Hours** field is calculated as follows:

Total Contact Hours/Week for Meeting 1 + Total Contact Hours/Week for Meeting 2

For the following course meeting information:

Meeting 1	29-AUG-1992	20-DEC-1992	M W F	8:00 - 9:00	3 hours/week
Meeting 2	29-AUG-1992	20-DEC-1992	T R	8:30 - 9:00	1 hour/week

The calculation is as follows:

Meeting 1 = 3 hours/week

Meeting 2 = 1 hour/week

WCH = 3 + 1 = 4

When a daily attendance accounting method is specified on a section, the value appearing in the **Daily Contact Hours** field is calculated as follows:

$$\frac{\text{Total Contact Hours for Meeting 1}}{\text{Number of Days in Meeting 1}} + \frac{\text{Total Contact Hours for Meeting 2}}{\text{Number of Days in Meeting 2}}$$

For the following course meeting information:

Meeting 1	29-AUG-1992	20-DEC-1992	M W F	8:00 - 9:00	3 hours/week
Meeting 2	29-AUG-1992	20-DEC-1992	T R	8:30 - 9:00	1 hour/week

The calculations are as follows:

Total number of MWFs, taking exclusion days into account is 43.

Total number of TRs, taking exclusion days into account is 30.

Meeting 1  $\frac{3 \text{ hours/week}}{3 \text{ meetings/week}} \times 43 \text{ meeting days} = 43 \text{ contact hours}$

Meeting 2  $\frac{1 \text{ hours/week}}{2 \text{ meetings/week}} \times 30 \text{ meeting days} = 15 \text{ contact hours}$

Meeting 1  $\frac{43 \text{ contact hours}}{43 \text{ meeting days}} = 1$

Meeting 2  $\frac{15 \text{ contact hours}}{30 \text{ meeting days}} = .5$

DCH = 1 + .5 = 1.5

## Schedule Overrides

The Schedule Override Form (SSAOVRR) allows the user to override the following catalog values associated with the section, such as **College**, **Division**, **Department**, and **Taxonomy of Program**. There is no edit against the catalog information. If the Catalog states that the course is in the College of Arts and Sciences in the English Department, the class schedule information may be changed to the Business School, Economics Department.

These override fields are used when the course is rolled to academic history either in batch or online, and the overrides are used in the Class Roster (SFRSCST), Schedule Section Tally (SSRTALY), and Class Schedule (SSRSECT) reports.

## Block Scheduling

The Block Scheduling function will allow an institution to register students in a group of user-defined courses through the use of user-defined block codes. This processing impacts the Schedule, General Student, and Registration modules, which are set up as follows.

### Schedule Module

The first step in using the block scheduling function is defining the institution's blocks on the Block Code Validation Form (STVBLCK). The block codes can be up to ten position alphanumeric characters.

After defining the block codes, the institution should now begin to establish the sections of courses that are to be associated with each block code on the Block Schedule Control Form (SSABLCK), where the keys to the form are block code and term. Sections may also be assigned to the blocks via the Schedule Detail Form (SSADETL).

When adding sections to the block of courses via the Block Schedule Control Form (SSABLCK), the **CRN** is a required field that when entered will display the following data elements: subject code, course number, section number, part of term, campus, maximum enrollment, actual enrollment, and seats remaining. A section may be associated with more than one block. A **Y** displays in the **Multiple Block** field to indicate that the section belongs to multiple blocks. When adding sections to a block code on SSABLCK, the user may enter a valid subject, course, and section number to retrieve section data, just as entering a valid CRN will retrieve all section information. Use Count Query Hits from the **CRN** field to access the Schedule Section Query Form (SSASECQ) from which valid section codes may be queried and selected.

Courses may also be entered on this form by entering a valid subject code, course number, and section number combination. Use List from the **Subject**, **Course Number**, or **Section** fields to display the Schedule Section Query Form (SSASECQ), from which valid section information may be retrieved.

If the section has variable credit or billing hours, the system defaults in the low credit or billing hours. Both credit and billing hours can be overridden for this CRN and all students associated with the block on the Block Schedule Control Form (SSABLCK) or for an individual student on the Student Course Registration Form (SFAREGS).

Total credit and billing hours for the Key Information **Block (Code)** field are displayed at the bottom of SSABLCK. Please be aware that these hours are accurate only after saving all of the changes.

 **Note**

Additional changes may be made to a student's registration on the Student Course Registration Form (SFAREGS), so these values do not necessarily reflect the registered credit hours for students associated with the block. ■

If the section has multiple grading modes, the default grading mode is used in the **Grade Mode** field of the Block Schedule Control Form (SSABLCK). The grading mode may be overridden for this CRN and all students associated with the section of SSABLCK, or for an individual student on the Student Course Registration Form (SFAREGS).

If a special approval code is required for the section, then the **Special Approval** field will default to Y. This flag can not be overridden on the Block Schedule Control Form (SSABLCK).

The purpose of these defaults is to assure that the registration process occurs with a minimal amount of data entry.

The Block Schedule Code information on the Schedule Detail Form (SSADETL) permits the user to assign the course to a block code. This is a repeating section which lists all of the block codes of which the course section is a part. Block codes may be added and deleted in this section. If a block code is added through the Block Schedule Code information, the special approval code override will be established when you save (as it is in SSABLCK), and all other defaults will be set to the course as if they were added in SSABLCK. If overrides are desired for this section and all students associated with the block, the data must be overridden on the Block Schedule Control Form (SSABLCK). If overrides are desired for an individual student, the changes must be made on the Student Course Registration Form (SFAREGS).

All of the standard registration errors are still controlled by the Term Control Form (SOATERM) and are performed at the time of registration on the Student Course Registration Form (SFAREGS).

## Block Scheduling Example

In the Fall of 1993, a freshman business student must take the following sections:

10050	ACCT	101
10057	ECON	100
10087	ENGL	100
10197	HIST	105

These sections would be added on the Block Schedule Control Form (SSABLCK) for the Fall term 1993 and Freshman Business Student block. An example of a block code could be FL93FRBS where:

FL93	=	Fall 1993
FR	=	Freshman
BS	=	Business students

From the Block Schedule Control Form (SSABLCK), the user is able to access the following forms via the Options Menu:

SSASECT	Schedule Form
SSADETL	Schedule Detail Form
SFAREGS	Student Course Registration Form

The Block Schedule Query Form (SSABLKQ), which is a stand alone query form, displays all the block codes which have been created for a term. An optional CRN may be entered in the key. If the CRN is entered, then only those blocks which contain the CRN entered are returned. This limits the display of block schedule codes to those blocks to which the CRN belongs. For example, if the mass lecture section of Psychology 101 belongs to five different freshman blocks, then the CRN may be entered in the key to verify that all five blocks have been given the Psychology 101 section.

SSABLKQ may be accessed from the **Block (Code)** field of SSABLCK using Count Query Hits and from the **CRN** field of SSABLCK using List to display related blocks. It may also be accessed using Count Query Hits from the **Block Schedule** field in the Student Term window of the Student Course Registration Form (SFAREGS) to display valid blocks for the registration term.

The Block Schedule Section Query Form (SSABSCQ), which is a stand alone query form, lists all the sections associated with a block code. A valid term and block code are required in the key. From the **Block (Code)** field, you can display an LOV from STVBLCK, or use Count Query Hits to display SSABLKQ.

The Schedule Section Query Form (SSASECQ) has a **Block Schedule** field. Placing a Y in this field when entering a query will display only those courses that are related to a block code.

The Schedule Cross List Definition Form (SSAXLST) has a **Block (Code)** field. If any of the CRNs which are cross-listed also belong to a block code, the **Block (Code)** field displays a value of *Y*.

The Block Schedule Query Form (SSABLKQ) may be accessed from the Options Menu of SSAXLST to see the detail information associated with the block. The Block Schedule Control Form (SSABLCK) may be accessed from the Options Menu of the Schedule Form (SSASECT).

## General Student and Registration Modules

To attach a block code to a student, use the General Student Form (SGASTDN), the Student Course Registration Form (SFAREGS), or the Student Block Load Process (SGPBLCK). Block codes are maintained by effective term, like all other general student information. Hence, an institution may want to maintain a consistent block code for each student so that the information need not be updated on a term-by-term basis.

To associate students with block codes online, the user may enter a valid code in the **Block (Code)** field on either the General Student Form (SGASTDN) or the **Block Schedule** field on the Student Course Registration Form (SFAREGS). You can access SSABLKQ from the Student Term window on SFAREGS and from the Additional Information block of SGASTDN. Use Count Query Hits from the **Block (Code)** field (SGASTDN) or the **Block Schedule** field (SFAREGS) to display the Block Schedule Query Form (SSABLKQ) and query for valid codes for the effective term. (The CRN is optional.)

Students may be associated with block codes in batch by using population selection and the Student Block Load Process (SGPBLCK). This process will associate the groups of students defined through population selection to a block code for an effective term. Population selection and the Student Block Load Process (SGPBLCK) must be performed for each population and block code you wish to assign.

Assigning a block code to a student will not automatically register the student for the CRNs associated with the block code.

If a block code is associated with a student for a term, this information will display in the **Block Schedule** field in the Student Term window of the Student Course Registration Form (SFAREGS). This information will assist the user when performing block scheduling registration online.

Two fields located in the Registration information of this form, the **Process Block** and **Delete All CRNs** fields, are described below.

Check the **Process Block** box and use Next Block to default the CRNs associated with the student's block code into SFAREGS. If any values (grading mode, variable credit hours) have options other than the defaults available, the user is permitted to override these values at this time. However, the system will not prompt you to enter values in the multiple value fields as it normally would in registration, because the system assumes you have done the bulk of your adjustments at the section level when assigning CRNs to a

block code. Entering a student in a block does not register the student for the associated CRNs; it simply defaults the CRNs to SFAREGS if this process is selected.

Check the **Delete All CRNs** box and use Next Block to activate the system to delete all the CRNs for the active person and term in the key. This enables you to quickly delete CRNs if a student was associated with the wrong block, or if they have changed blocks.

The **Process Block** and **Delete All CRNs** requests cannot be processed concurrently.

For example, a student assigned in the Fall of 1993 to the Freshman Business Student block code was registered for the following sections:

10050	ACCT	101
10057	ECON	100
10087	ENGL	100
10197	HIST	105

At a later time during the registration period, the student needed to be removed from this block and added into the Computer Science block.

In order to accurately perform this function, you must enter the Student Course Registration Form (SFAREGS) and delete all CRNs. To do this, check the **Delete All CRNs** box and use Next Block. Next, the block code for the student needs to be changed. This can be done in SFAREGS. (It may also be changed in SGASTDN, but there is no need to access this form, since SFAREGS is active.) Finally, after entering the Computer Science block code for the student, you must check the **Process Block** box and use Next Block. The CRNs associated with the block will default into the form.

 **Note**

**Delete All CRNs** will work for *any* student, not just those students assigned to a block code. ■

Additional individual courses may be added or deleted from the Student Course Registration Form (SFAREGS) as needed to modify the student's registration.

The **Block Indicator** field located on the Registration Section Query Form (SFQSECM) and the **Block** field located on the Registration Course Query Form (SFQSECT) indicate if the course being queried is associated with a block code.

 **Note**

Simply deleting the block code from SFAREGS or SGASTDN will *not* remove the CRNs from the student's registration once the student has been processed either online or in batch through Course Request and Scheduling processing. ■

Block Scheduling registration may also be performed in batch using Course Request and Scheduling. To begin this process, use population selection to populate the Student Course Request Form (SFACREQ) with the CRNs of the selected students' block codes

via the Course Request Load Process (SFPBLCK). SFPBLCK defaults the CRNs of a student's block code to that student's record on the Student Course Request Form (SFACREQ).

The selected students will now have course requests for the term, and the steps for Course Request and Scheduling may be performed. Below is a brief outline of the steps which need to be followed to complete this process. Please refer to the *Course Request and Scheduling Handbook* for more details. Note that any student, (not just those associated with block codes), with student requests for the term will be processed through Course Request and Scheduling.

## Reports and Processes

The following reports and processes are used with block scheduling:

- The Term Roll Report (SSRROLL) has a parameter that allows you to roll block schedule codes from one term to another.
- The Scheduled Section Tally Report (SSRTALY) displays blocks associated with a CRN along with the information that has been previously reported.
- The Student Report (SGRSTDN) also displays the student's block code.
- The Student Block Load Process (SGPBLCK) associates a group of students defined through population selection to a block code for an effective term.
- The Course Request Load Process (SFPBLCK) defaults the CRNs of a student's block code to the selected student's record on the Student Course Request Form (SFACREQ) for the effective term.

## Sample Test Plan

1. Create block codes on the Block Code Validation Form (STVBLOCK).

FL94FRUD	(Fall 1994, Freshman, Undecided)
FL94SOBS	(Fall 1994, Sophomore, Business)
FL94JRNR	(Fall 1994, Junior, Nursing)

2. In the Block Schedule Control Form (SSABLCK) or in the Schedule Detail Form (SSADETL), associate sections with the block codes for the effective term.

<i>199401,</i>	<i>FL94FRUD:</i>	
	ENGL	100
	COMP	110
	BIOL	101
	HIST	100

<i>199401,</i>	<i>FL94SOBS:</i>	
	BUAD	200
	MKTG	200
	MKTG	201
	ECON	200

<i>199401,</i>	<i>FL94JRNR:</i>	
	GENE	300
	HCAD	300
	NURS	300
	BIOL	301

- Assign students to block codes online for the desired term via the General Student Form (SGASTDN) or the Student Course Registration Form (SFAREGS). To assign students to block codes using batch processing, perform population selection, and run the Student Block Load Process (SGPBLCK) for that population.

A population selection for the new freshmen might specify effective term, level, degree, and major. For example:

SGBSTDN_TERM_CODE_EFF	=	'199401'	AND
SGBSTDN_LEVL_CODE	=	'01'	AND
SGBSTDN_DEGC_CODE	=	'00'	AND
SGBSTDN_MAJR_CODE	=	'0000'	

- Process block codes for your students online by entering the Student Course Registration Form (SFAREGS) and checking the **Process Block** box, and then use Next Block. This will default the CRNs associated with the student's block code to SFAREGS. Regular registration processing should be continued from this point. (Additional courses may be added, and all error checking will be performed at this time.)

To process block codes in batch, use population selection, and run the Course Request Load Process (SFPBLCK) for the that population.

A population selection may include effective term and block codes. For example:

SGBSTDN_TERM_CODE_EFF	=	'199401'	AND
SGBSTDN_MAJR_CODE	=	'FL94JRNR'	

Running the Course Request Load Process (SFPBLCK) will populate the Student Course Request Form (SFACREQ) with the CRNs of the student's block. To continue

batch block scheduling, the steps for Course Request and Scheduling must now be followed.

## Course Request Processing Operating Procedures

This section provides the user with step-by-step instructions for running Course Request and Scheduling Processing. Refer to this section, along with the Module Flowchart in the *Course Request and Scheduling Handbook*, as a guideline.

1. Enter the student's course requests using the Student Course Request Form (SFACREQ), or load the request data to the SFBCREQ Oracle table using the ORACLE\*Loader Utility, and run the Course Request Load Process (SFPBLCK) for a selected population.
2. Run the Course Request Edit Report (SFPCREQ) batch program to validate the student's course request information. Review the report for error conditions, (i.e., student not admitted for this term or ID does not exist). Correct and rerun this step until satisfactory results are obtained.

### Note

At the time that course requests are entered online through the Student Course Request Form (SFACREQ), the system validates that the CRN exists but does not check for holds, level restrictions, etc. It is only after the Course Request Validation Process has been run through SFPCREQ that you will detect these errors on the Course Request Edit Report (SFPCREQ). You should call up the Student Course Request Form (SFACREQ) for each of the students listed on the Course Request Edit Report, and make any necessary corrections. ■

### Note

A check appears in the **Status** checkbox for every course request combination (primary/alternate) that has passed the initial validation criteria. The requests that are not valid have an unchecked **Status** box. If the request has not yet been run through the Course Request Validation Process, the **Status** box is blank. ■

3. Enter parameter values in job submission, and then run the job SCTH1000 to extract course request and bio/demo data from Banner. Review the Control Report for errors before continuing.
4. Enter parameter values in job submission, and then run the job SCTC1000 to extract course schedule data from Banner. Review the Control Report for errors before continuing.
5. Enter parameter values in job submission, and then run the job SCTC1500 to create the two Oracle tables SFBREST and SFBSECT that contain restriction and relative course information for each section extracted from Banner. Review the Control Report for errors before continuing.

6. Enter parameter values in job submission, and then run the job SCTC2000 to begin the course request process. This process produces an Update Change Register (Audit Trail) that can be used to validate that the proper requests have been processed and to detect errors (i.e., time conflicts, level restrictions, etc.) in a student's course request set. If changes are made to the student's requests using Banner, it will be necessary to re-run from Step 2. Review the Control Report for errors before continuing.
7. Enter parameter values in job submission, and then run the job CRQC3000 to produce selected reports from the course request process. Review these reports and make corrective actions if necessary. If changes are made to Banner, then the process must be re-started from Step 2. When you are ready for the final run of course request (i.e., you are satisfied with the results and have no further changes to make to Banner), then be sure the Create Registration File parameter is set to *Y*. This option creates the input Student Scheduling.

## Scheduling Process Operating Procedures

This section provides the user with step-by-step instructions for running the Schedule Process. Refer to this section, along with the Module Flowchart in the *Course Request and Scheduling Handbook*, as a guideline.

*Before starting be sure you have completed the steps outlined in the Course Request and Scheduling Operating Procedures.*

1. Enter parameter values in job submission, and then run job SCTD0600 to begin the Student Scheduling. Review the output from this process, and if no errors are encountered, continue to the next step. If you make changes to the Banner data, then you must re-run the Course Request Processing.
2. Enter parameter values in job submission, and then run job SCHC3000 to produce selected reports from the Student Scheduling Process. Review these reports and make corrective actions. If you make changes to the Banner data, then you must re-run the Course Request Processing.

At this point the Scheduling process has been completed. The following steps deal with loading the data from Scheduling to the Banner Registration module. Note that once the load has been run for a student, that student's requests cannot be re-run.

3. Start up ORACLE\*SQLldr using the `stucreq.ct1` control file and the enrollment file `d1520.dat` as input. This process will create an interim Oracle registration table (SFRFREQ) that is used as input to the next step.
4. Run the Course Request Update (SFPFREQ) batch program to load the course request and schedule data to the Banner registration tables and update the section counts. Review the Audit Trail for errors.

# Auto Scheduling Processing

## Overview

This functionality is used to create the interface between Banner Schedule processing and the third party scheduling products Schedule 25/Model25.

This includes:

- generating a campus profile for physical features, partitions, departments, rooms, and a control file,
- capturing this information in the Catalog and Schedule modules and generating a class descriptor file,
- extracting the Banner data to create all files required to interface to the scheduling tool,
- creating a work file and viewing/updating extraction data with an associated process to be used for housekeeping of this file, and
- integrating classroom assignment information from Schedule25.

You may view assignments made by Schedule25, accept or reject the assignments, and accept and/or load the accepted assignments (and those that have not been rejected) into Banner.

## Getting Started

The following steps are suggested for the initial positioning of Banner for use with the third party scheduling product.

1. Create validation table entries.
2. Define your campus.
3. Define room attributes and characteristics of your classrooms.
4. Record class location and required room characteristics at the subject level.
5. Record class location and room characteristic overrides (if any) at the course, section, or meeting time level.
6. Complete your class setup.
7. Extract data from Banner.
8. Run Schedule25.

9. Review Scheduler output.
10. Update the Work Table and review.
11. Update class records in SSRMEET.
12. Purge appropriate work table entries.

## Create your validation table entries

1. Define the scheduler number for the appropriate partition codes using the **Scheduler Sequence (Number)** field on GTVPARS.
2. Define the room attribute codes using the **Auto Schedule** and **Scheduler Number** checkboxes on STVRDEF.
3. Define which schedule types are eligible to be scheduled using the **Automatic Schedule** checkbox on STVSCHD.
4. Ensure that scheduling status codes have been loaded to GTVSCHS from seed data provided by SunGard® Higher Education.

## Define your campus

If it is not necessary to define partitions at your institution, if they do not play a role in your current classroom allocation. This step is not required. Otherwise, do the following.

1. Ensure that seed data provided by SunGard Higher Education is loaded into the Scheduling Partition Validation Form (GTVPARS). This seed data consists of a default partition code (00). Once loaded, define your partitions (physical groupings of buildings and/or rooms) at your school or campus on this form.
2. Draw a blueprint of your school or campus by assigning a partition code to those buildings containing classrooms to be used in the class assignment process. This can be accomplished by entering a partition code on the Building Definition Form (SLABLDG). All room records created after this update will automatically receive this partition code.
3. Assign a partition code to a classroom using the Room Definition Form (SLARDEF). Existing room records (i.e., rooms defined after a partition code was assigned to the building record) do not need to have this code entered unless this classroom requires an override of the building default.

## Define room attributes and characteristics for your classrooms

Again, if room allocation according to room characteristics is not required, this step is not required. Otherwise, do the following.

1. Identify those room attribute codes that will be used in the scheduling process using the **Auto Schedule** and **Scheduler Number** fields on the Building/Room Attribute Code Validation Form (STVRDEF).
2. Assign the classroom characteristics in the Room Attributes block of the Room Definition Form (SLARDEF) by selecting attribute codes defined as auto schedule in STVRDEF. For example: if the room is characterized as wheelchair accessible or has Lab or Audio Visual equipment, this information should be associated with the room. Although this step is not required, is strongly encouraged that it be used to ensure that classes requiring these attributes will be allocated to the appropriate classroom.
3. If a classroom will be unavailable for scheduling for all or part of the term, use the Room Inactivation block on SLARDEF to identify the dates, times, and/or days of the week that classes should not be booked into these rooms.

## Record class location and required room characteristics at the subject level

Partition and room attribute preferences should be assigned at the subject level using the Subject Scheduling Rules Form (SSASBSH). These preferences will be used as the basis for the meeting time records during the extract process.

These preferences should represent the base requirements and should be applicable for all sections created for this subject. These values can be overridden but not excluded in the next step if required.

### Partitions

1. Decide if you are using partitions.  
  
If partitions are being used as a determining factor in room scheduling, then do the following.
2. Define your partition preferences at the subject level using the Partition Preferences block in the main window on SSASBSH.
3. Define your partition preferences at the course level using the Partition Preferences block in the Partition and Room Attribute Preferences window on SCACRSE.
4. Define your partition preferences at the section level using the Partition Preferences block in the Section Scheduler Preferences window on SSASECT.

5. Define your partition preferences at the class level using the Partition Preferences block in the Meeting Time Preferences window on SSASECT.

For example: English classes always held in a particular building.

## Room Attributes

1. Decide if you are using room attributes.

If room attributes are being used as a determining factor in room scheduling, then do the following.

2. Define your room attribute preferences optionally at the subject level using the Room Attribute Preferences block in the main window on SSASBSH.
3. Define your room attribute preferences optionally at the course level using the Room Attribute Preferences block in the Partition and Room Attribute Preferences window on SCACRSE.
4. Define your room attribute preferences at the section level using the Room Attribute Preferences block in the Section Scheduler Preferences window on SSASECT.
5. Define your room attribute preferences at the class level using the Room Attribute Preferences block in the Meeting Time Preferences window on SSASECT.

For example: English classes always need an overhead projector.

6. Assign a scheduling status code to a class or meeting time using the **Auto Scheduler** field in the Meeting Time window on SSASECT.

## Record class location and room characteristic overrides (if any) at the course, section, or meeting time level

You can also define partition preferences at other levels, but these are viewed as overrides to the requirements set at the subject level.

- Course Preferences are set in the Partition Preferences block of the Course Catalog Form (SCACRSE) and will apply to all sections and meeting times created for this course.
- Section Preferences are set in the Section Partition Preferences block of the Schedule Form (SSASECT) and will apply to all meetings times created for this section.
- Meeting Time Preferences are set in the Meeting Time Partition Preferences block of the Schedule Form (SSASECT) and will apply to an individual meeting time only.

The extract process will first look to the meeting time preferences, then the section, and lastly the course preferences to record overrides to the subject level definitions.

For example:

If overrides were identified at the section level, no meeting time preferences would be entered causing the extract to look for section preferences. Having found those records, no further search would be conducted.

Therefore, in this example, if there were also course preferences defined, they would not be picked up for the creation of the Class Descriptor records.

## Complete the class setup

Assuming that all meeting time records have been created in the Schedule Form (SSASECT), there are a few more requirements remaining for those classes requiring classroom allocation.

1. Identify those schedule types that are eligible to be scheduled through the use of the **Automatic Scheduler** checkbox on the Schedule Type Code Validation Form (STVSCHD).
2. Ensure that the provided seed data is loaded into the Scheduling Status Code Validation Form (GTVSCHS). These codes will be attached to those meeting times requiring classroom assignment via Schedule25.
3. Assign an appropriate scheduling status code to a class and/or meeting time record using the **Auto Scheduler** field in the Meeting Time window on SSASECT. This scheduling status code should reflect the action that the scheduling tool must accomplish, such as needs a classroom assignment.
4. Ensure that the schedule type for the section has been marked as eligible by checking the **Automatic Scheduler** checkbox in STVSCHD.

## Extract data from Banner

1. Define the control records required by Schedule25 for the terms to be processed in the Scheduling Tool Interface Control Form (SSACTRL).
2. Create a subject code to be used in the creation of room inactivation “phantom class” in the Subject Code Validation Form (STVSUBJ).
3. Run the Schedule 25 and Work File Creation Process (SSRSCRM) for the required term(s) and/or campus(es).
4. Review the extract data in Scheduler Work Form (SSASCHW). Any modifications or corrections should be made in Banner, and the extract should be run.

## Review scheduler output

Schedule25 produces many valuable reports from listings of classes placed, classes not placed, placement analysis, and rooms still available for placement to process diagnostic messages (exception or error messages).

See the third party *Schedule25 Process Manual* for report descriptions and examples.

## Update work table and review

1. Run the Scheduler Work Table Update Process (SSRSCUP).
2. If necessary, review the data returned from Schedule25. Updates to a select few fields are possible but should be done with great caution. Please see the information on SSRSCUP later in this section.
3. It is possible to produce a report of what the meeting time information would likely be, prior to actually saving the information to the SSRMEET table, by running the Class Schedule Report (SSRSECT).

## Update class records in SSRMEET

1. Run the Building/Room Update Process (SSRSCMT).
2. If the update is successful, the **Update (Indicator)** will be updated on the Scheduler Work Form (SSASCHW).
3. If a record has not been updated in Banner, research will be required to determine the reason. It may be necessary to manually update the meeting time record if, for some reason, the meeting time record in Banner has been changed since the extract process was run.

## Purge appropriate work table entries

Records may be purged from the work table by running the Scheduler Work Table Purge Process (SSRSCPR) for the appropriate term and/or campus.

## Forms Used in Schedule 25 Processing

### **Scheduling Status Code Validation Form (GTVSCHS)**

This form is used to store Schedule25 status codes. These codes control whether the section is to be scheduled and listed.

The following codes are required by Schedule25 for assignment and are delivered as seed data:

<b>Code</b>	<b>Description</b>
NSM	Class needs a room assignment.
ISM	Class needs a room assignment and has a preferred first choice room indicated in the <b>Room Name</b> field. This code limits the initial pool of candidate rooms in the assignment algorithm.
WSM	Class needs a room assignment and must be assigned with the preceding NSM or ISM record to the same room at the same time (cross-listed).
RSM	Class is related to the preceding NSM or ISM record and must be assigned to the same room but not at the same days/time.
NXM	Class needs a room assignment and can share a room with another class whose times overlap with it (can be double-booked).
IXM	Class needs a room assignment, has a preferred first choice room indicated in the <b>Room Name</b> field, and can share a room with another class whose times overlap with it (can be double-booked).
RXM	Class is related to the previous NXM or IXM record and must be assigned to the same room at the same or overlapping times.

The following codes are required by Schedule25 for pre-assignment and are delivered as seed data:

<b>Code</b>	<b>Description</b>
ASM	Class has a room assignment that was made manually or in another system, such as the student information system.
AXM	Class has a room assignment that was made manually or in another system, and the class time span overlaps part of all of the time span of another class assigned to the same room (double-booking or intentional conflict).
HSM	This is a set of home cross-listed classes pre-assigned to the same room at identical days and times.

Code	Description
VSM	This is a set of visitor cross-listed classes pre-assigned to the same room at identical days and times.
5SM	Schedule25 assigned the class a room during a previous run.
5XM	Schedule25 assigned the class a room, and it is double-booked with another class.

### Partition Code Validation Form (GTVPARS)

This form is used to define partition codes (a category or grouping of rooms). These codes are optional, but can be instrumental in the scheduling process providing preferred placement of classes in a geographic area of the school.

The partition can be placed at various levels:

- on the subject (referred to in Schedule25 documentation as department)
- on the course
- on the section
- on the meeting time for the section
- on the building
- on the individual room

When a new partition code and description are entered and saved in this form, a sequence number is generated if the **Scheduler Sequence (Number)** field is null. This provides a unique identifier that will, in turn, be used in the Schedule25 algorithm. The partition code serves as a convenience for the user and is not extracted to the Scheduler software.

#### Note

You can add a campus code to a partition. ■

The Schedule25 Rooms file requires that each room have a partition. Use the seed entry of code *00* for the default partition.

### Subject Scheduling Rules Form (SSASBSH)

This form facilitates the assignment of partitions and room attribute preferences at the subject level.

### Scheduling Tool Interface Control Form (SSACTRL)

This form is used to enter and update the control file parameters necessary to run Schedule25.

## Scheduler Work Form (SSASCHW)

This form can be used to:

- View the data from Banner prior to being submitted to Schedule 25, and
- Preview the results of Schedule25 prior to its integration into Banner.

### Note

Preference records are not viewable. ■

## Schedule Type Code Validation Form (STVSCHD)

Use the **Automatic Scheduler** field to denote which sections to extract for input into the Schedule25 process when the schedule type is assigned to a CRN. When this indicator is checked, only sections with a schedule type defined to have classes automatically scheduled will be extracted.

## Building/Room Attribute Code Validation Form (STVRDEF)

Use the following fields for Schedule25 processing.

- The **Auto Schedule** checkbox is used to denote which sections to extract for input into the Schedule25 process when the schedule type is assigned to a CRN. This checkbox also controls the operation of the **Scheduler Number** field.
- If the **Auto Schedule** checkbox is checked, **Scheduler Number** field will be automatically populated with a unique one-up number, if the Schedule25 Code is null when the attribute record is saved. Or, the user can enter a unique one-up number. If the **Auto Schedule** checkbox is unchecked, the **Scheduler Number** value will be blank.
- Use the Resequence item in the Options Menu to resequence the value in the **Scheduler Number** field. This process will overwrite the existing code and replace it in sequence starting with a value of *01*.
- Although the **(Attribute) Code** is primarily for use with classroom requirements, it is also used to populate the Schedule25 files.

## Building Definition Form (SLABLDG)

Use the **Partition** field in the Building Definition block in the main window to define an appropriate partition code for the building and provide a means to group rooms for scheduling purposes. Valid values come from GTVPARS.

This partition code will default to the room when new entries are created on SLARDEF. If the partition code is changed, it will not affect existing room definitions but will be reflected in any new room records that are created.

- If all rooms in a building are considered one partition, then the partition code could be defined at the building level, rather than at the individual room level, to save data entry.
- If a building is divided into several partitions, the partition code should not be assigned to the building but should be entered for the individual rooms.
- If the majority of rooms within a building constitute one partition, you can record the partition on the building and override the applicable code for rooms not considered part of the “building” partition.
- The extract process reads the partition from the room definition. If a partition code is not established on the room record, the partition code defined on this form will be retrieved.

### **Room Definition Form (SLARDEF)**

Use the **Partition** field in the Room Definition block in the main window to define an appropriate partition code for the room and provide a means to group rooms for scheduling purposes. Valid values come from GTVPARS.

If a partition code has been defined for the corresponding building record, the building partition code will default into this field. It is possible that you may wish to deviate from the partition code that has been established for the building. In that case, you may change the displayed value.

The extract process will first read the partition from the room definition. If a partition code is not established on the room record, the partition code defined for the building will be retrieved.

#### ***Attributes, Inactive Dates, and Comments Window***

Use the **Begin Time** and **End Time** fields in the Room Inactivation block to enter the times that the room will be unavailable to schedule classes. The time is entered in military format.

The end date and end time must be greater than the start date and start time respectively. Also, start dates and times cannot be entered without end dates and times and vice versa. These checks will avoid diagnostic errors in the Schedule25 software.

Use the checkboxes for the days of the week (**Mon, Tues, Wed, Thu, Fri, Sat, Sun**) to allow you to enter the days that the room will be unavailable to schedule classes.

A room may be de-activated a number of ways:

- If the room was unavailable every day for a particular time period, you would need to enter the appropriate start and end dates.

- If the room was unavailable for a particular period of the day, the effective start and end dates would need to be entered, as well as the start and end times of the inactivation.
- If the room was unavailable on a specific day of the week for a given time period, the day of the week would be checked, and the affected start/end dates would be entered.

The room inactivation records will result in the creation of phantom classes in the Scheduler Extract with a pre-assigned status to prevent class assignments. These phantom classes will contain a CRN of 99999 and a course number of 9999.

## Basic Course Information Form (SCACRSE)

You can access the Partition and Room Attribute Preferences window from other windows in the form, using the Options Menu.

### *Partition and Room Attribute Preferences Window:*

This window has two blocks, the Partition Preferences block and the Room Attribute Preferences block.

#### *Partition Preferences Block*

Use the Partition Preferences block to inform the Scheduler software that classes for related CRNs should be assigned to a particular location on campus and to provide the option to state the room scheduling preferences for the course. The partition preferences defined on the catalog record are defaulted to the CRN when new sections are created.

If the partition preference code in the Catalog module is blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from STVRDEF.

The **Preference (Number)** field accepts the entry of a two digit number. Valid values are 01, 02, 03, or 04. Multiple records for the same preference number can be entered.

Use the **Copy** button or a Duplicate Record function to copy preferences from one term range to another.

#### *Room Attribute Preferences Block*

Use the Room Attribute Preferences block to define the room attributes (i.e., blackboard, projector, overhead) required to facilitate the needs of the instructor.

If the room attribute preference code in the Catalog module is blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from GTVPARS.

The **Preference (Number)** field accepts the entry of a two digit number. Valid values are 01, 02, 03, or 04. Multiple records for the same preference number can be entered.

Use the **Copy** button or a Duplicate Record function to copy preferences from one term range to another.

### **Schedule Form (SSASECT)**

Use the Options Menu selections to access the Section Scheduler Preferences window and the Meeting Time Preferences window.

#### ***Meeting Time Window:***

Use the following fields for Schedule 25 processing.

- The **Auto Scheduler** field is used to display the assignment code for the meeting time, whether the meeting time should be scheduled by Schedule25, and the scheduling needs of the class i.e., cross-listed. Valid values come from GTVSCHS. Meeting times with a pre-assigned status are processed without regard for blackout times in the pre-assigned room.
- The **Scheduler Preference** button is used to access the Meeting Time Preferences block to display the partition preferences and/or room attributes that are defined for an individual meeting time.
- The **Partition Details** checkbox is display only. This checkbox is checked if meeting time partition preferences have already been defined for this meeting time. Checked indicates there are preferences; unchecked indicates there are no preferences.
- The **Room Attribute Details** checkbox is display only. This checkbox is checked if meeting time room attribute preferences have already been defined for this meeting time. Checked means there are preferences; unchecked means there are no preferences.

#### ***Section Scheduler Preferences Window:***

This window has two blocks, the Partition Preferences block and the Room Attribute Preferences block.

##### ***Partition Preferences Block***

Use the Partition Preferences block to define partition preferences for scheduling purposes.

If the partition preference code in the section is blank, the Catalog preferences are displayed. If the Catalog preferences are blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from GTVPARS.

The **Preference Number** field accepts the entry of a two digit number. Valid values are *01, 02, 03, or 04*. Multiple records for the same preference number can be entered.

#### *Room Attribute Preferences Block*

Use the Room Attribute Preferences block to define room attributes (i.e., blackboard, projector, overhead) that are required to ensure that the proper equipment is also assigned to the room.

If the room attribute preference code in the section is blank, the Catalog preferences are displayed. If the Catalog preferences are blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from STVRDEF.

The **Preference Number** field accepts the entry of a two digit number. Valid values are *01, 02, 03, or 04*. Multiple records for the same preference number can be entered.

#### ***Meeting Time Preferences Window:***

This window is used to override the section preferences for an individual class. This block is displayed by selecting the **Scheduler Preference** button in the Meeting Time block for an individual meeting time.

The meeting time information displayed in this block defaults from the record where the cursor was positioned in the Meeting Time block. The start and end dates and times are displayed, as well as the days of the weeks for the class.

#### *Partition Preferences Block*

Use the Partition Preferences block to define partition preferences for scheduling purposes.

If the partition preference code in the section is blank, the Catalog preferences are displayed. If the Catalog preferences are blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from GTVPARS.

The **Preference Number** field accepts the entry of a two digit number. Valid values are *01, 02, 03, or 04*. Multiple records for the same preference number can be entered.

#### *Room Attribute Preferences Block*

Use the Room Attribute Preferences block to define room attributes (i.e., blackboard, projector, overhead) that are required to facilitate the needs of the instructor.

If the room attribute preference code in the section is blank, the Catalog preferences are displayed. If the Catalog preferences are blank, the preferences defined for the subject are displayed. If you wish to modify this value, valid values come from STVRDEF.

The **Preference Number** field accepts the entry of a two digit number. Valid values are *01, 02, 03, or 04*. Multiple records for the same preference number can be entered.

## Reports and Processes Used in Schedule 25 Processing

### **Room Attribute Sequence Update Process (SSRATSQ)**

This process allows you to automatically populate the sequence number of the room attribute information in the STVRDEF table. This process can be run at your discretion to populate values, resequence existing values, or delete all values and can sort the information by alpha or numeric organization.

### **Schedule25 Work File Creation Process (SSRSCRM)**

This process is used to create the building, room, partition, department (subject), class descriptor, and control files required to run the scheduling tool. It needs to be run a minimum of once for each scheduling cycle. All files have a length of 81 characters (if the default values are used in the control file).

Even though Schedule25 requires a standard naming convention for these data (in lower case), this process will permit you to change the file names. However, the files being read into Schedule25 must follow the mandated naming convention.

The following files are created by running this process.

- Room Attribute File (*phys.date*)
- Partition File (*part.dat*)
- Room File (*rooms.dat*)
- Department Subject File (*depts.dat*)
- Control File (*ctrl.dat*)
- Class Descriptor File (*datain.dat*)

These files will be written to the same directory as the job listing.

### **Room Attribute File (*phys.date*)**

This file represents all room attributes identified in STVRDEF as auto schedule. This data is not room-specific. A maximum of 96 room attributes will be accepted by Schedule25.

*Banner data exported:*

Room Attribute Code and Name	STVRDEF_CODE STVRDEF_DESC	Example: AV Audio Visual Equipment
Room Attribute Sequencer Number	STVRDEF_SCHEDULER_ NUMBER	Example: 45

### Partition File (part.dat)

This file represents all partitions codes identified in GTVPARS. If the extract process is being run for a specific campus (as defined in the Scheduling Campus Code parameter), only partition codes with a matching campus code will be selected. If no campus code has been selected at the running of this process, all GTVPARS rows will be selected. This data is not room specific. A maximum of 96 partitions will be accepted by Schedule25.

*Banner data exported:*

Partition Code and Name	GTVPARS_CODE GTVPARS_DESC	Example: Default Partition
Partition Sequencer Number	GTVPARS_SCHEDULER_ NUMBER	Example: 01

### Room File (rooms.dat)

This file represents active classrooms defined in SLARDEF based on the campus code entered in the extract parameters. If multiple terms are entered, the minimum term entered in the parameter is used in the selection of active rooms. If no campus is entered at the time the extract process is run, then all rooms will be selected.

This file contains a minimum of three different records, with the P record being optional:

- Room Name information (N record)
- Room Size information (S record)
- Location/Partition information (L record)
- Room Attribute information (P record)

The location record will contain the partition code entered on the room definition in Banner. If no partition is assigned at the room level, the partition code entered on the building definition is extracted. If the building record has not been assigned a partition code, then the default partition code (value 00) is used. The physical attributes, if any, reflect the codes entered in the Room Attributes block of SLARDEF.

*Banner data exported:*

*N (Name) Record*

Room Name	SLBRDEF_BLDG_CODE SLBRDEF_ROOM_NUMBER	Example: BIOL 101
-----------	--	----------------------

*S (Size) Record*

Seating Capacity	SLBRDEF_CAPACITY	Example: 50
------------------	------------------	----------------

*L (Location) Record*

Partition Number	GTVPARS_SCHEDULER_ NUMBER	Example: 01
------------------	------------------------------	----------------

Of partition assigned at room level (if any), or building level (if any) or default partition

*P (Physical Attribute) Record – Not required*

Room Attribute Number	STVRDEF_SCHEDULER_ NUMBER	Example: 37, 39
-----------------------	------------------------------	--------------------

If several attributes are defined, they will be strung together separated by a comma.

Of attributes assigned at room level (if any), or building level (if any)

**Department Subject File (depts.dat)**

This file represents information about each subject entered in STVSUBJ. Schedule25 requires that a location record be created for each department and/or subject. Preferences used for extract purposes are drawn from the locations and room attributes entered on SSASBSH. If no location preferences are defined on this form for the subject, the default partition is used. Although only four location and room attribute preferences are written to the file for each subject, multiple preferences will be concatenated on these records based on the priority assigned (Preference Number). A maximum of 500 subjects will be accepted by Schedule25.

This file contains a minimum of three different records with the P record being optional:

- Subject name information (N record)
- Subject key information (K record)
- Campus partition preferences (C record)
- Room attribute preferences (P record)

*Banner data exported:*

*N (Name) Record*

Subject Name	STVSUBJ_DESC	Example:
		Introduction to Biology

*K (Key) Record*

Subject Code	STVSUBJ_CODE	Example:
		BIOL

 **Note**

The placement and length of the subject code on this record is dependent upon the parameters specified for the Department ID in the Scheduling Tool Interface Control Form (SSACTRL). ■

*C (Campus Partition) Record (up to 4 records will be created)*

Partition Preferences	GTVPARS_SCHEDULER_NUMBER	Example:
If several partitions are defined, they will be strung together separated by a comma.	Of partition entered	01, 45

*P (Physical Attribute) Record – Not required*

Room Attribute Preference	STVRDEF_SCHEDULER_NUMBER	Example:
If several attributes are defined, they will be strung together separated by a comma.	Of attributes entered	37, 39

## Control File (ctrl.dat)

This file defines the placement of values in the Class Descriptor table for use by the extract process, as well as parameters necessary for the execution of the assignment algorithm. Input data for this file is retrieved from the Scheduling Tool Interface Control Form (SSACTRL). The selection of the term and campus are determined by values entered in the Scheduling Term Code and Scheduling Campus Code parameters.

One record will be created in this file for each of the fields contained in SSACTRL.

## Class Descriptor File (datain.dat)

This file contains information about all active classes (sections containing a status code identified as active in STVSSTS) requiring a room assignment by the Schedule25 assignment algorithms, manually assigned (pre-assigned) classes, as well as phantom classes created to implement room inactivations identified in SLARDEF. Only those classes matching the term code(s) or date ranges entered in the parameters will be selected.

The following selection criteria will be used when examining a section for extraction:

- Are meeting times defined?
- Does the section have a schedule type defined to be automatically scheduled?
- Has a Schedule25 status code been assigned to the meeting time record?

This file contains three different record types:

- Class descriptor record
- Room attribute preferences overrides (P record)
- Partition preferences overrides (L record)

### Note

Preference override records will only be created if the class descriptor record contains a scheduling status code of NSM or 1SM. ■

Cross-listed sections (identified by the cross link code assigned to the section in SSASECT) requiring room assignment will be grouped together. Only one of these sections should contain the scheduling code of NSM (needs room assignment) on the meeting time record, with the others identified as WSM.

For a more in depth explanation of the various scheduling codes, please consult your third party *Schedule25 Process Manual*.

This process will seek out preference overrides, first accessing the meeting time preferences. If no records have been created at the meeting time level, the section preferences will be examined. If no records have been identified there, the course

preference tables will be considered. If no preference overrides are defined at any of these levels, no P or L records will be generated.

*Banner data exported:*

Department ID	SSBSECT_SUBJ_CODE SSBSECT_CRN SSBSECT_TERM_CODE	Example: BIOL 10001 200110
Days of the Week	SSRMEET_SUN_DAY SSRMEET_MON_DAY SSRMEET_TUE_DAY SSRMEET_WED_DAY SSRMEET_THU_DAY SSRMEET_FRI_DAY SSRMEET_SAT_DAY	Example: UMTWRFS
Start Time (Hours & Minutes)	From SSRMEET_BEGIN_TIME	Example: 0800
Finish Time (Hours & Minutes)	From SSRMEET_END_TIME	Example: 0850
AM/PM Designator	H (military time)	
Maximum Enrollment	SSBSECT_MAX_ENRL  Or default value defined in <b>Default Enrollment</b> field in SSACTRL if none is defined at the section level.	Example: 0050
Begin Month and Day	From SSRMEET_START_DATE	Example: 1031
End Month and Day	From SSRMEET_END_DATE	Example: 1231
Room Name (pre-assigned classes only)	SSBSECT_BLDG_CODE SSBSECT_ROOM_CODE	Example: BIOL 101
Scheduling Assignment Code	SSRMEET_SCHS_CODE	Example: NSM

 **Note**

The placement and length of the fields on this record are dependent upon the parameters specified in the Scheduling Tool Interface Control Form (SSACTRL). ■

*P (Physical Attribute) Record – Overrides to those defined at the subject level, if applicable*

Room Attribute	STVRDEF_SCHEDULER_NUMBER	Example: 37, 39
If several attributes are defined, they will be strung together separated by a comma.	Of attribute assigned at meeting time level (if any), or section level (if any) or course level (if any)	

*L (Campus Partition) Record – Overrides to those defined at the subject level, if applicable*

Partition Preference	GTVPARS_SCHEDULER_NUMBER	Example: 01, 45
If several partitions are defined, they would be strung together separated by a comma.	Of partition assigned at meeting time level (if any), or section level (if any) or course level (if any)	

### **Phantom Class Records**

These records are created by the extract to reflect room inactivation periods defined in the Room Inactivation block on SLARDEF. Rooms with inactive time periods in the term code range selected in the Scheduling Term Code parameter are created as pre-assigned classes. This prevents Schedule 25 from assigning another class to that room.

*Banner data exported:*

Department ID	Subject Code defined in run parameters CRN of IR followed by a sequential number Appropriate term code from run parameters	Example: DUMN IR001 200110
Days of the Week	SLRRUSE_SUN_DAY SLRRUSE_MON_DAY SLRRUSE_TUE_DAY SLRRUSE_WED_DAY SLRRUSE_THU_DAY SLRRUSE_FRI -DAY SLRRUSE_SAT_DAY	Example: UMTWRFS
Start Time (Hours & Minutes)	From SLRRUSE_BEGIN_TIME	Example: 0001
Finish Time (Hours & Minutes)	From SLRRUSE_END_TIME	Example: 2400
AM/PM Designator	H (military time)	
Maximum Enrollment	0000	
Begin Month and Day	From SLRRUSE_START_DATE	Example: 1031
End Month and Day	From SLRRUSE_END_DATE	Example: 1231
Room Name (pre-assigned classes only)	SLRRUSE_BLDG_CODE SLRRUSE_ROOM_NUMBER	Example: BIOL 101
Scheduling Assignment Code	5SM	

### **Work File Creation**

Work file records (SSTSCHW) will be created if the Create Work Table parameter has been set to *Y*. If work file records exist when this process is run, new entries will be added to the table.

## Scheduler Work Table Update Process (SSRSCUP)

This process reads the three Schedule25 output files (`sortdp.dat`, `losers.dat`, `notposs.dat`), and updates the existing records in the Scheduler Work Table (SSTSCHW). These entries can then be previewed via the SSASCHW form.

The following fields in the Scheduler Work Table (SSTSCHW) will be updated as a result of the scheduling process:

Field	Description
Update (Indicator)	<p><i>Y</i> indicates that the class has been assigned a room (classes contained in the <code>sortdp.dat</code> file).</p> <p><i>N</i> and <i>L</i> indicate that no class assignment has taken place. (<i>N</i> represents classes contained in the <code>notposs.dat</code> file; <i>L</i> from the <code>losers.dat</code> file.)</p>
Status	If the <b>Update (Indicator)</b> has been set to <i>Y</i> , and the original scheduling status code was NSM or 1SM, this will be changed to 5SM.
Building	If the <b>Update (Indicator)</b> has been set to <i>Y</i> , the building assigned by Schedule25 will be displayed.
Room	If the <b>Update (Indicator)</b> has been set to <i>Y</i> , the room numbers assigned by Schedule25 will be displayed.

### Note

Meeting time records in SSRMEET are *not* updated at this time. See the Update Building/Room Process (SSRSCMT). ■

## Update Building/Room Process (SSRSCMT)

This process reads the Scheduler Work Table (SSTSCHW) entries (viewable on SSASCHW) and updates the SSRMEET table with the room assignments generated in Schedule25. Only those records with an Update Indicator of *Y* will be applied. The Work Table Update Indicator value will be changed to a *U* (as a result of the upload process of the scheduled sections) to indicate that the upload was successful for that record.

A possible cause for an unsuccessful upload may be attributable to a data change in SSRMEET since the running of the extract. If the begin and/or end dates and/or times or days of the week have been changed, this process will not be able to match the work table records to SSRMEET. The work table represents a snapshot of how the record looked at the time of the running of the extract.

If building and room information was previously entered in the SSRMEET record, and the scheduling status code was originally set to one that required a classroom assignment, that data will be overwritten with the new Schedule25 information.

 **Note**

This process may be run as often as necessary to incorporate changes to the work table. However, extreme caution should be exercised if overriding values in the work table. Such changes could result in double-booking of rooms, for example. ■

### **Scheduler Work Table Purge Process (SSRSCPR)**

This process will delete Work Table (SSTSCHW) data based on the term and/or campus specified in the process parameters.

### **Class Schedule Report (SSRSECT)**

The Use Scheduler Results parameter can be used to interject the work file information (for successful room assignments) giving the option to preview the report with newly scheduled information prior to updating the SSRMEET table. It also serves as an optional test phase for the schedule processing. Data from SSTSCHW is not displayed when the Update Indicator is not *Y* (successfully scheduled). Valid values for the parameter are *Y* or *N*, and the default is *N*.

### **Schedule Purge Process (SSPSCHD)**

This process will delete the partition (SSRSPRT, SSRMPRT) and room attribute preference (SSRSRDF, SRMRDF) table entries.

### **Term Roll Report (SSRROLL)**

Use the following parameters to roll partition, preference, and room attribute information.

- Roll Partition Codes (Required) - Enter *Y* to roll the partition codes or *N* to not roll the codes. The default is *Y*.
- Roll Room Attributes (Required) - Enter *Y* to roll the cross room attributes or *N* to not roll the attributes. The default is *Y*.
- Roll CRN Scheduler Stat Code (Required) - Enter *Y* to roll CRN scheduler status codes or *N* to not roll the codes. The default is *Y*.
- Roll Meeting Time Part Pref (Required) - Enter *Y* to roll meeting time partition preferences or *N* to not roll the preferences. The default is *Y*.
- Roll Meeting Time Room Attrib (Required) - Enter *Y* to roll meeting time room attribute preferences or *N* to not roll the preferences. The default is *Y*.

## Purge Process

The following purge process is part of the Schedule module.

### sspschd.pc - Schedule Purge

This process will purge the class schedule information based on the user-specified parameter of term. Schedule information will not be deleted if outstanding registration information exists for the term. A new summary section history record is created in the table SCRSECT. Columns in this table include: Subject Code, Course Number, Campus, Schedule Type, Term, Number of Sections Offered, Total Enrollment, Total Census Enrollment, and Activity Date. This history record allows institutions to review the historical course section information in summary format.

#### **Warning**

When a third party product is used for scheduling, you may need to rerun the report before you continue scheduling. Be aware that the first time SSPSCHD is run, the SCRSECT table is populated with data for the purged records. After the table has been populated, if the report is a second time, data is not purged. ■

## Class Schedule Reports

---

This section contains a sample of each report in the Class Schedule module. Parameter definitions have also been provided for your convenience.

The following reports are run through the Class Schedule module:

Term Roll Report	(SSRROLL)
Class Schedule Report	(SSRSECT)
Scheduled Section Tally Report	(SSRTALY)
Schedule Purge	(SSPSCHD)
Room Attribute Sequence Update Process	(SSRATSQ)
Schedule 25 Work File Creation Process	(SSRSCRM)
Scheduler Work Table Update Process	(SSRSCUP)
Update Building/Room Process	(SSRSCMT)
Schedule Work Table Purge Process	(SSRSCPR)
Section Fee Population Process	(SSPMFEE)
Schedule Open Learning Rule Default Process	(SSPRDEF)
Available Seats to Zero Process	(SSRASTZ)

# Term Roll Report (SSRROLL)

**Description** This report is used to roll sections of one term to another term. It can be used for traditional sections or open learning sections. As a pre-requisite to running SSRROLL, the section default rules must be set up in SOAORUL. Some parameters allow you to roll data from Catalog as well as from Schedule.

## Note

When registration from and to dates from the open learning rules on SOAORUL are rolled, an error message is displayed and the process is halted if open learning rules have not been created for the new term. ■

## DegreeWorks Prerequisite Checking and CAPP Area Prerequisite Checking

Use the **Prerequisite Check Method** radio group on either the Schedule Prerequisite and Test Score Restrictions Form (SSAPREQ) or the Schedule Form (SSASECT) to select which type of prerequisite requirements will be in effect for the sections listed in the report. The choices are *Basic or None*, *CAPP*, or *DegreeWorks*. The default value is *Basic or None*.

- When the **Prerequisite Check Method** field is set to *Basic or None*, course test score and prerequisite restrictions will be listed for the sections in the report.
- When the **Prerequisite Check Method** field is set to *DegreeWorks* or *CAPP*, DegreeWorks prerequisite requirements or CAPP area prerequisite requirements will be listed for the sections in the report.
- When DegreeWorks is installed, the *CAPP* option is not available.
- When CAPP area prerequisite checking is in use, the *DegreeWorks* option is not available.

When DegreeWorks prerequisite checking is in use, the report will either roll the prerequisite checking method and or convert prerequisite checking from a CAPP method to a DegreeWorks method, according to the begin term in *PREREQCHK* rule on GTVSDAX. This allows you to create the schedule of class sections for terms where DegreeWorks will be used. SSRROLL will not allow the new sections to have a CAPP prerequisite checking method, unless a CAPP area is associated with the section per the Roll CAPP Area or DW Pre-reqs parameter.

Set the *PREREQCHK* rule to the beginning term code for which you use to use DegreeWorks. When the SSRROLL process is run and the Roll CAPP Area or DW Pre-reqs parameter is used, the process converts the prerequisite checking method for the sections from CAPP to DegreeWorks, based on the parameter setting. You can roll and convert the prerequisite checking method from Catalog or Schedule, or you can choose to not roll the data. Not rolling the data resets the **Prerequisite Check Method** radio group to *Basic or None* (SCBCRSE\_PREREQ\_CHK\_METHOD\_CDE and SSBSECT\_PREREQ\_CHK\_METHOD\_CDE set to B).

You can review the settings on GTVSDAX for the *PREREQCHK* rule after running SSRROLL. When a valid term code is stored in the **External Code** field that is less than or equal to the term code the data was rolled to, the settings should be as follows:

- For CRNs where the SSBSECT\_PREREQ\_CHK\_METHOD\_CDE is set to *C*, the setting is changed to *D*.
- For CRNs where the SSBSECT\_PREREQ\_CHK\_METHOD\_CDE is set to *B*, the setting remains as it is.

The Roll Test Restricts and Pre-reqs parameter rolls data based on the following conditions.

- When the parameter is set to *Y*, sections with SSBSECT\_CAPP\_PREREQ\_TEST\_IND column set to *B* are rolled, as well as any associated test score restrictions and prerequisites.
- When the parameter is set to *C*, courses with the SCBCRSE\_CAPP\_PREREQ\_TEST\_IND column set to *B* are rolled, as well as any associated test score restrictions and prerequisites.

The Roll CAPP Area or DW Pre-reqs parameter rolls data based on the following conditions.

- When the parameter is set to *Y*, sections with SSBSECT\_CAPP\_PREREQ\_TEST\_IND column set to *C* or *D* are rolled, as well as any associated CAPP area prerequisites.
- When the parameter is set to *C*, courses with the SCBCRSE\_CAPP\_PREREQ\_TEST\_IND column set to *C* or *D* are rolled, as well as any associated CAPP area prerequisites.
- When the parameter is set to *N*, the SSBSECT\_CAPP\_PREREQ\_TEST\_IND column is set to *B*.

The following term information is also considered:

- For from and to terms that are prior to the start term for the *PREREQCHK* rule on GTVSDAX, CAPP prerequisites are rolled.
- For from and to terms that are after the start term for the *PREREQCHK* rule on GTVSDAX, traditional prerequisites or DegreeWorks prerequisites are rolled.
- For terms that straddle the from and to term range, the setting of the SSBSECT\_CAPP\_PREREQ\_TEST\_IND column is changed from *C* to *D*, and CAPP area prerequisites are dropped from the section.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Report Term	Yes	Enter the term code for which the term roll process is to be performed.	Term Code Validation Form (STVTERM)
	From Term	Yes	Enter the term code from which the section data is to be rolled.	Term Code Validation Form (STVTERM)
	To Term	Yes	Enter the term code to which the section data is to be rolled.	Term Code Validation Form (STVTERM)
	Run Mode (A=Audit, U=Update)	Yes	A or audit mode will print a report of all sections which will be rolled to the selected term. <i>U</i> or update mode will update and create the new section records for the selected term. The default run mode is <i>A</i> (audit mode).	A Audit U Update
	Roll Meeting Time	Yes	Enter <i>Y</i> if you want to roll the meeting times for the sections. This parameter also rolls the buildings and rooms associated with the meeting times, if those buildings and rooms exist. The default is <i>Y</i> .	Y Roll meeting times N Do not roll meeting times
	Roll Instructors	Yes	Enter <i>Y</i> if you want to roll the instructors for the sections. Instructors may only be rolled if meeting time information is rolled forward. The default is <i>Y</i> .	Y Roll instructors N Do not roll instructors

Parameters	Name	Required?	Description	Values
	Roll CRNs (Y = Roll, N = Oneup)	Yes	<p>Enter <i>Y</i> if you want to roll the CRNs for the sections, or <i>N</i> if you want the system to generate a oneup number. The default is <i>Y</i>.</p> <p>If <i>Y</i>, you are able to roll block schedule codes, links, cross-listed data, and corequisites. If <i>N</i>, you are not able to roll block schedule codes, links, cross-listed data, or corequisites.</p> <p>CRNs <i>must</i> be rolled in order to roll corequisites and cross-listed data. If you enter <i>N</i> for Roll CRNs but enter <i>Y</i> for the Roll Corequisites and/or the Roll Cross List Data parameters, the <i>Y</i> will be ignored, and <i>N</i> will be printed as the value for those parameters in the Report Control information.</p>	<p>Y Roll CRNs</p> <p>N Generate oneup number</p>
	Roll Links	Yes	<p>Enter <i>Y</i> if you want to roll the link information for the sections. The default is <i>Y</i>.</p>	<p>Y Roll link information</p> <p>N Do not roll link information</p>
	Roll Corequisites	Yes	<p>Enter <i>Y</i> if you want to roll the corequisite information for the sections. The default is <i>Y</i>.</p> <p>CRNs <i>must</i> be rolled in order to roll corequisites and cross-listed data. If you enter <i>N</i> for Roll CRNs but enter <i>Y</i> for the Roll Corequisites and/or the Roll Cross List Data parameters, the <i>Y</i> will be ignored, and <i>N</i> will be printed as the value for those parameters in the Report Control information.</p>	<p>Y Roll corequisite information</p> <p>N Do not roll corequisite information</p>
	Roll Fees	Yes	<p>Enter <i>Y</i> to roll the fees from Schedule, <i>C</i> to roll the fees from Catalog, or <i>N</i> to not roll the fees. The default is <i>Y</i>.</p>	<p>Y Roll fees from Schedule</p> <p>C Roll fees from Catalog</p> <p>N Do not roll fees</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Roll Degree Attributes	Yes	Enter <i>Y</i> to roll the degree attributes from Schedule, <i>C</i> to roll the degree attributes from Catalog, or <i>N</i> to not roll the degree attributes. The default is <i>Y</i> .	<p><i>Y</i> Roll degree attributes from Schedule</p> <p><i>C</i> Roll degree attributes from Catalog</p> <p><i>N</i> Do not roll attributes</p>
	Roll Text	Yes	Enter <i>Y</i> to roll the text from Schedule, <i>C</i> to roll the text from Catalog, or <i>N</i> to not roll the text. The default is <i>Y</i> .	<p><i>Y</i> Roll text from Schedule</p> <p><i>C</i> Roll text from Catalog</p> <p><i>N</i> Do not roll text</p>
	Roll Class Restrictions	Yes	Enter <i>Y</i> to roll the class restrictions from Schedule, <i>C</i> to roll the class restrictions from Catalog, or <i>N</i> to not roll the class restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll class restrictions from Schedule</p> <p><i>C</i> Roll class restrictions from Catalog</p> <p><i>N</i> Do not roll class restrictions</p>
	Roll College Restrictions	Yes	Enter <i>Y</i> to roll the college restrictions from Schedule, <i>C</i> to roll the college restrictions from Catalog, or <i>N</i> to not roll the college restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll college restrictions from Schedule</p> <p><i>C</i> Roll college restrictions from Catalog</p> <p><i>N</i> Do not roll college restrictions</p>
	Roll Fld of Study Restrictions	Yes	Enter <i>Y</i> to roll the field of study restrictions from Schedule, <i>C</i> to roll the field of study restrictions from Catalog, or <i>N</i> to not roll the field of study restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll field of study restrictions from Schedule</p> <p><i>C</i> Roll field of study restrictions from Catalog</p> <p><i>N</i> Do not roll field of study restrictions</p>

Parameters	Name	Required?	Description	Values
	Roll Level Restrictions	Yes	Enter <i>Y</i> to roll the level restrictions from Schedule, <i>C</i> to roll the level restrictions from Catalog, or <i>N</i> to not roll the level restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll level restrictions from Schedule</p> <p><i>C</i> Roll level restrictions from Catalog</p> <p><i>N</i> Do not roll level restrictions</p>
	Roll Reserved Seats	Yes	Enter <i>Y</i> if you want to roll the reserved seats for the sections. The default is <i>Y</i> .	<p><i>Y</i> Roll reserved seats</p> <p><i>N</i> Do not roll reserved seats</p>
	Roll Cross List Data	Yes	<p>Enter <i>Y</i> if you want to roll the cross list data for the sections. The default is <i>Y</i>.</p> <p>CRNs <i>must</i> be rolled in order to roll corequisites and cross-listed data. If you enter <i>N</i> for Roll CRNs but enter <i>Y</i> for the Roll Corequisites and/or the Roll Cross List Data parameters, the <i>Y</i> will be ignored, and <i>N</i> will be printed as the value for those parameters in the Report Control information.</p>	<p><i>Y</i> Roll cross list data</p> <p><i>N</i> Do not roll cross list data</p>
	Roll Campus Restrictions	Yes	Enter <i>Y</i> to roll the campus restrictions from Schedule, <i>C</i> to roll the campus restrictions from Catalog, or <i>N</i> to not roll the campus restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll campus restrictions from Schedule</p> <p><i>C</i> Roll campus restrictions from Catalog</p> <p><i>N</i> Do not roll campus restrictions</p>
	Roll Contract Information	Yes	Enter <i>Y</i> if you want to roll the contract information for the sections. The default is <i>Y</i> .	<p><i>Y</i> Roll contract information</p> <p><i>N</i> Do not roll contract information</p>
	Roll Schedule Override Info	Yes	Enter <i>Y</i> if you want to roll the schedule override for the sections. The default is <i>Y</i> .	<p><i>Y</i> Roll schedule overrides</p> <p><i>N</i> Do not roll schedule overrides</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Roll Test Restricts & Pre-reqs	Yes	Enter <i>Y</i> to roll the test score restrictions and prerequisites from Schedule, <i>C</i> to roll the test score restrictions and prerequisites from Catalog, or <i>N</i> to not roll the test score restrictions and prerequisites. The default is <i>Y</i> .	<p><i>Y</i> Roll test score restrictions and prerequisites from Schedule</p> <p><i>C</i> Roll test score restrictions and prerequisites from Catalog</p> <p><i>N</i> Do not roll test score restrictions and prerequisites</p>
	Roll Schedule Evaluation	Yes	Enter <i>Y</i> if you want to roll the schedule evaluation for the sections. The default is <i>Y</i> .	<p><i>Y</i> Roll schedule evaluation</p> <p><i>N</i> Do not roll schedule evaluation</p>
	Roll Block Schedule Codes	Yes	Enter <i>Y</i> if you want to roll the block schedule codes for the sections. The default is <i>Y</i> .	<p><i>Y</i> Roll block schedule codes</p> <p><i>N</i> Do not roll block schedule codes</p>
	Roll CAPP Area or DW Pre-reqs	Yes	Enter <i>Y</i> to roll CAPP or DegreeWorks prerequisite rules from Schedule, <i>C</i> to roll CAPP or DegreeWorks prerequisite rules from Catalog, or <i>N</i> to not roll prerequisite rules. The default is <i>Y</i> .	<p><i>Y</i> Roll prerequisite rules from Schedule</p> <p><i>C</i> Roll prerequisite rules from Catalog</p> <p><i>N</i> Do not roll prerequisite rules</p>
	Roll Degree Restrictions	Yes	Enter <i>Y</i> to roll the degree restrictions from Schedule, <i>C</i> to roll the degree restrictions from Catalog, or <i>N</i> to not roll the degree restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll degree restrictions from Schedule</p> <p><i>C</i> Roll degree restrictions from Catalog</p> <p><i>N</i> Do not roll degree restrictions</p>
	Roll Program Restrictions	Yes	Enter <i>Y</i> to roll the program restrictions from Schedule, <i>C</i> to roll the program restrictions from Catalog, or <i>N</i> to not roll the program restrictions. The default is <i>Y</i> .	<p><i>Y</i> Roll program restrictions from Schedule</p> <p><i>C</i> Roll program restrictions from Catalog</p> <p><i>N</i> Do not roll program restrictions</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Roll Gradable Components	Yes	Enter <i>Y</i> to roll gradable components for a section in one term to the same section in a new term. The default is <i>Y</i> .	Y Roll gradable components N Do not roll gradable components
	Roll Partition Codes	Yes	Enter <i>Y</i> to roll the partition codes from Schedule, <i>C</i> to roll the partition codes from Catalog, or <i>N</i> to not roll the partition codes. The default is <i>Y</i> .	Y Roll partition codes from Schedule C Roll partition codes from Catalog N Do not roll partition codes
	Roll Room Attributes	Yes	Enter <i>Y</i> to roll the cross room attributes from Schedule, <i>C</i> to roll the cross room attributes from Catalog, or <i>N</i> to not roll the cross room attributes. The default is <i>Y</i> .	Y Roll cross room attributes from Schedule C Roll cross room attributes from Catalog N Do not roll cross room attributes
	Roll CRN Scheduler Status Code	Yes	Enter <i>Y</i> to roll the CRN scheduler status code or <i>N</i> to not roll the code. The default is <i>Y</i> .	Y Roll CRN scheduler status code N Do not roll CRN scheduler status code
	Roll Meeting Time Part Pref	Yes	Enter <i>Y</i> to roll the meeting time partition preferences or <i>N</i> to not roll the preferences. The default is <i>Y</i> .	Y Roll meeting time partition preferences N Do not roll meeting time partition preferences
	Roll Meeting Time Room Attrib	Yes	Enter <i>Y</i> to roll the meeting time room attribute preferences or <i>N</i> to not roll the preferences. The default is <i>Y</i> .	Y Roll meeting time room attribute preferences N Do not roll meeting time room attribute preferences

<i>Parameters</i>	<i>Name</i>	<i>Required?</i>	<i>Description</i>	<i>Values</i>
	Roll Sub-Components	Yes	Enter <i>Y</i> to roll gradable sub-components for a section in one term to the same section in a new term. The default is <i>N</i> .  This parameter can only be set to <i>Y</i> when the Roll Gradable Components parameter is set to <i>Y</i> .	<i>Y</i> Roll sub-components <i>N</i> Do not roll sub-components
	Roll Section Syllabus	Yes	Enter <i>Y</i> to roll the section syllabus information from Schedule, <i>C</i> to roll the section syllabus information from Catalog, or <i>N</i> to not roll the section syllabus information. The default is <i>Y</i> .  If you enter <i>Y</i> , the records from SSASYLB will be created for the new term/CRN.	<i>Y</i> Roll section syllabus from Schedule <i>C</i> Roll section syllabus from Catalog <i>N</i> Do not roll section syllabus
	Create Section Rules	Yes	Enter <i>R</i> to roll existing rules. Enter <i>D</i> to default the existing open learning rules defined for the section to the term specified in the To Term parameter. Enter <i>N</i> to not roll or default the rules. The default is <i>R</i> .  If you enter <i>R</i> , the existing records in the SSRRSTS, SSRRFND, and SSREXTN tables are copied to the new term. If you enter <i>D</i> , section level rules are created from the existing SOAORUL entries for the new term.  <b>Note:</b> As a pre-requisite to running SSRROLL, the section default rules must be set up in SOAORUL.	<i>R</i> Roll existing rules <i>D</i> Default open learning rules <i>N</i> Do not roll or default rules
	Roll Student Web Controls	Yes	Enter <i>Y</i> to roll the student Web controls from SBSSECC for the section or <i>N</i> to not roll the controls. The default is <i>Y</i> .	<i>Y</i> Roll student Web controls <i>N</i> Do not roll Web controls
	Roll Faculty Web Controls	Yes	Enter <i>Y</i> to roll the faculty Web controls from SSBFSEC for the section or <i>N</i> to not roll the controls. The default is <i>Y</i> .	<i>Y</i> Roll faculty Web controls <i>N</i> Do not roll Web controls

Parameters	Name	Required?	Description	Values
	Roll Labor Distribution	Yes	Enter <i>Y</i> to roll the labor distribution FOAPAL elements for the section (SSACLBD) or <i>N</i> to no roll the FOAPAL elements. The default is <i>Y</i> .  <b>Note:</b> FOAPAL stands for chart of accounts code entries - Fund, Organization, Account, Program, Activity, and Location.	Y Roll FOAPAL elements for sections N Do not roll FOAPAL elements
	Roll Department Restrictions	Yes	Enter <i>Y</i> to roll department restrictions from Schedule, <i>C</i> to roll department restrictions from Catalog, or <i>N</i> to not roll department restrictions. The default is <i>Y</i> .	Y Roll department restrictions from Schedule C Roll department restrictions from Catalog N Do not roll department restrictions
	Roll Student Attr Restrictions	Yes	Enter <i>Y</i> to roll student attribute restrictions from Schedule, <i>C</i> to roll student attribute restrictions from Catalog, or <i>N</i> to not roll student attribute restrictions. The default is <i>Y</i> .	Y Roll student attribute restrictions from Schedule C Roll student attribute restrictions from Catalog N Do not roll student attribute restrictions
	Roll Cohort Restrictions	Yes	Enter <i>Y</i> to roll cohort restrictions from Schedule, <i>C</i> to roll cohort restrictions from Catalog, or <i>N</i> to not roll cohort restrictions. The default is <i>Y</i> .	Y Roll cohort restrictions from Schedule C Roll cohort restrictions from Catalog N Do not roll cohort restrictions

## Class Schedule Report (SSRSECT)

**Description** This report is used to print the schedule of classes for a term.

The report displays and rolls the following information for use with open learning sections:

- schedule type code description for the section
- instructional method code description assigned to the section
- long course title from the syllabus (if designated)
- meeting type for the meeting time information
- long section title from the syllabus (if designated)

If no meeting time records have been defined for an open learning section, *N/A* is printed on the report, instead of *TBD*.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Schedule Term	Yes	Enter the term for which you want the class schedule to be printed.	Term Code Validation Form (STVTERM)
	Part of Term (% for all)	Yes	Enter the part of term code for which the schedule of classes is to be printed. Multiple parts of term can be entered, or a % can be used to indicate that all parts of term within the selected term are to be printed.	Part of Term Code Validation Form (STVPTRM)
	Order 1-Subj-Course, 2-Coll, Div, Dept	Yes	Enter 1 to print the schedule of classes in subject, course number order, or enter 2 to print in college, division, department order. All sort options create page breaks by campus and part of term.	1 Subject, Course order 2 College, Division, Department order
	Campus (% for all)	Yes	Enter the campus code representing the campus for which the schedule is to be printed.	Campus Code Validation Form (STVCAMP)
	Course Status (% for all)	Yes	Enter the course status code(s) for the class schedule for which information is to be printed.	Section Status Code Validation Form (STVSSTS)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	User Scheduler Results	No	Enter the <i>Y</i> to retrieve meeting time data using the scheduler work data on SSTSCHW or <i>N</i> to retrieve the scheduled data from SSRMEET. The default is <i>N</i> .  The scheduler work data is used in place of the schedule data.	<i>Y</i> Data from SSTSCHW - scheduler <i>N</i> Data from SSRMEET - schedule
	Schedule Type (% for all)	Yes	Enter % for all schedule types, or enter the schedule type for the section.	Schedule Type Code Validation Form (STVSCHD)
	Instructional Method (% = all)	No	Enter the instructional method for the courses, or enter % for all sections. You may enter multiple values.  This parameter is used to report all sections with the same instructional method (i.e., Web-based).	Instructional Method Validation Form (GTVINSM)
	Print Long Course Title	Yes	Enter <i>Y</i> to print the existing course title from the course record (SCBCRSE) or the long course title from the course syllabus (SCRSYLN).  Enter <i>N</i> to not print the long course title. The default is <i>N</i> .	<i>Y</i> Print existing course title or long syllabus course title (if any) <i>N</i> Do not print the long course title
	Print Long Section Title	Yes	Enter <i>Y</i> to print the existing section title from the section record (SSBSECT) or the long section title from the syllabus record (SSRSYLN). If these are null, the title from the course record (SCBCRSE) will be used.  Enter <i>N</i> to not print the long section title. The default is <i>N</i> .	<i>Y</i> Print existing section title or long syllabus section title (if any) <i>N</i> Do not print the long section title

# Scheduled Section Tally Report (SSRTALY)

**Description** This report is used to list all sections for a term, with enrollment counts and seats remaining. It can be used for traditional sections or open learning sections. The output for the sections can be sorted in several ways: by subject and course order; by college, division, and department order; or by department, college, and division order.

The report displays the following types of information for the scheduled sections:

- term
- parts of term
- campus
- schedule type
- instructional method
- long course title from the syllabus (if designated)
- meeting type for the meeting time information
- long section title from the syllabus (if designated)

**Note**

If no meeting time records have been defined for an open learning section, *N/A* is printed on the report, instead of *TBD*. ■

Parameters	Name	Required?	Description	Values
	Term	Yes	Enter the term for which you want the scheduled sections to be printed.	Term Code Validation Form (STVTERM)
	Part of Term (% for all)	No	<p>Enter the part of term code for which the scheduled sections are to be printed. Multiple parts of term can be entered, or a % can be used to indicate that all parts of term within the selected term are to be printed.</p> <p>Leave this parameter blank (null) to select open learning sections when you do not wish to print all parts of term (%). If the report is run from the host, rather than from job submission, enter the word <i>NULL</i> at the parameter prompt to print open learning sections.</p>	Part of Term Code Validation Form (STVPTRM)
	Order of Report (VALUES 1, 2, 3)	Yes	Enter 1 to print the scheduled sections in subject, course order, or 2 to print in college, division, department order, or enter 3 to list the scheduled sections in department, college, division order. All sort options break first on the page by campus and part of term.	1 Subject, Course order 2 College, Division, Department order 3 Department, College, Division order
	Campus (% for all)	Yes	Enter the campus code representing the campus for which the scheduled sections are to be printed.	Campus Code Validation Form (STVCAMP)
	Instructional Method	Yes	Enter the instructional method for the sections, or enter % for all instructional methods. You may enter multiple values. This parameter is used to report all sections with the same instructional method (i.e., Web-based).	Instructional Method Validation Form (GTVINSM)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Print Long Course Title	Yes	Enter <i>Y</i> to print the existing course title from the course record (SCBCRSE) or the long course title from the course syllabus (SCRSYLN). Enter <i>N</i> to not print the long course title. The default is <i>N</i> .	Y Print existing course title or long syllabus course title (if any) N Do not print the long course title
	Print Long Section Title	Yes	Enter <i>Y</i> to print the existing section title from the section record (SSBSECT) or the long section title from the syllabus record (SSRSYLN). If these are null, the title from the course record (SCBCRSE) will be used. Enter <i>N</i> to not print the long section title. The default is <i>N</i> .	Y Print existing section title or long syllabus section title (if any) N Do not print the long section title

## Schedule Purge (SSPSCHD)

**Description** This report is used to purge class schedule information, as well as all associated section information, based on term. Schedule information will not be deleted if outstanding registration information exists for the term. It is recommended that the Registration Purge (SFPREGS) be run prior to running SSPSCHD.

A new summary section history record is created in the table SCRSECT. Columns in this table include: Subject Code, Course Number, Campus, Schedule Type, Term, Number of Sections Offered, Total Enrollment, Total Census Enrollment, and Activity Date. This history record allows institutions to review the historical course section information in summary format.

 **Warning**

When a third party product is used for scheduling, you may need to rerun the report before you continue scheduling. Be aware that the first time SSPSCHD is run, the SCRSECT table is populated with data for the purged records. After the table has been populated, if the report is a second time, data is not purged. ■

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term for which you want the schedule information to be purged. All terms less than or equal to the input process term will be purged if no registration exists.	Term Code Validation Form (STVTERM)
	Run Mode	Yes	Enter <i>A</i> to print a report of all schedule information that will be purged for the selected term. Enter <i>U</i> to update the database and purge the schedule information for the selected term.	A Audit U Update

## Room Attribute Sequence Update Process (SSRATSQ)

**Description** This process is used to automatically populate the sequence number of the room attribute information in the STVRDEF table. This process can be run at your discretion to populate values, resequence existing values, or delete all values.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Run Mode	Yes	Enter <i>A</i> to add sequence numbers for attributes, <i>D</i> to delete all existing sequence numbers, or <i>R</i> to resequence the existing sequence numbers. The default is <i>R</i> .	A Add D Delete R Resequence
	Sort Code	Yes	Enter <i>A</i> for alpha sort or <i>N</i> for numeric sort. The default is <i>N</i> .	A Alpha N Numeric

## Schedule25 Work File Creation Process (SSRSCRM)

**Description** This process is used to create the building, room, partition, department (subject), class descriptor, and control files required to run the scheduling tool. This process needs to be run a minimum of once for each scheduling cycle.

### Note

Due to the layout constraints of the `datain.dat` file, the duplicate meeting time scenario (handling CRNs with two identical SSRMEET records that do not have a building or room assignment) needs to be considered when this report is run. If the meeting times are adjusted by one minute, a unique meeting time record is created and will be scheduled by Schedule25. Use the exception report produced by SSRSCRM to highlight potential duplication issues and provide notification that adjustments to the meeting records are required. ■

### Note

The term in the section controls (SSACTRL) is treated as an effective term. If a campus code is not entered in the parameters when SSRSCRM or SSRSCUP are run, then the control record for the applicable effective term with no campus code is used as a valid control record. When SSRSCUP is run, it is especially important to use the same control record as was used for SSRSCRM processing if section control values are different from effective term to effective term. ■

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Scheduling Term Code	Yes	Enter the extract term code for the file.	Term Code Validation Form (STVTERM)
	Scheduling Campus Code	No	Enter the extract campus code for the file.	Campus Code Validation Form (STVCAMP)
	Start Date	No	Enter the start date in format MMM-DD-YYYY for the date range to extract meeting times.	
	End Date	No	Enter the end date in format MMM-DD-YYYY for the date range to extract meeting times.	
	Room Attribute Def Filename	Yes	Enter the room attribute definition filename. The default filename is <code>phys.dat</code> .	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Partition Definition Filename	Yes	Enter the partition definition filename. The default filename is <code>part.dat</code> .	
	Subject Definition Filename	Yes	Enter the subject definition filename. The default filename is <code>depts.dat</code> .	
	Room Definition Filename	Yes	Enter the room definition filename. The default filename is <code>rooms.dat</code> .	
	Control Parameters Filename	Yes	Enter the control parameters filename. The default filename is <code>ctrl.dat</code> .	
	Class Descriptor Filename	Yes	Enter the class descriptor filename. The default filename is <code>datain.dat</code> .	
	Create Work Table	Yes	Enter <i>Y</i> to create the Work table viewable on SSASCHW or <i>N</i> to not create the table. The default is <i>Y</i> .	Y Create Work table N Do not create Work table
	Control Term Code	Yes	Enter the effective term code for the control record from SSACTRL.	Term Code Validation Form (STVTERM)
	Control Campus Code	No	Enter the control campus code from SSACTRL.	Campus Code Validation Form (STVCAMP)
	Subject for Inactive Rooms	Yes	Enter the subject code to be used for the creation of inactive room periods.	Subject Code Validation Form (STVSUBJ)

## Scheduler Work Table Update Process (SSRSCUP)

**Description** This process reads the three Schedule25 export files (`sortdp.dat`, `losers.dat`, `notposs.dat`), updating the existing records in the Scheduler Work Table (SSTSCHW). These entries can then be previewed using SSASCHW.

### Note

The term in the section controls (SSACTRL) is treated as an effective term. If a campus code is not entered in the parameters when SSRSCR or SSRSCUP are run, then the control record for the applicable effective term with no campus code is used as a valid control record. When SSRSCUP is run, it is especially important to use the same control record as was used for SSRSCR processing if section control values are different from effective term to effective term. ■

Parameters	Name	Required?	Description	Values
	Control Record Term Code	Yes	Enter the term code for the Work table records to be updated based on the control record entered on SSACTRL.	Term Code Validation Form (STVTERM)
	Control Record Campus Code	No	Enter the campus code for the work table records to be updated based on the control record entered on SSACTRL.	Campus Code Validation Form (STVCAMP)
	Filename for Schedule Updates	Yes	Enter the directory/filename for the schedule updates file. The default filename is <code>sortdp.dat</code> .	
	Filename for Not Scheduled	Yes	Enter the directory/filename for the not scheduled courses file. The default filename is <code>losers.dat</code> .	
	Filename for Schedule Errors	Yes	Enter the directory/filename for the schedule errors file. The default filename is <code>notposs.dat</code> .	
	Audit or Update	Yes	Enter <i>A</i> to run the report in audit mode or <i>U</i> to update the database. The default value is <i>A</i> .	A Audit U Update
	Print Detail	Yes	Enter <i>Y</i> to print report detail or <i>N</i> to not print report detail. The default value is <i>N</i> .	Y Print detail N Do not print detail

## Update Building/Room Process (SSRSCMT)

**Description** This process reads the Scheduler Work Table (SSTSCHW) entries (viewable on SSASCHW) and updates the SSRMEET table with the room assignments generated in Schedule25. Only those records with an Update Indicator of *Y* will be applied. The Work Table Update Indicator value will be changed to a *U* as a result of the upload process of the scheduled sections to indicate that the upload was successful for that record.

Parameters	Name	Required?	Description	Values
	Term Code	Yes	Enter the term code(s) for the room assignments.	Term Code Validation Form (STVTERM)
	Audit/Update Mode	Yes	Enter <i>A</i> to run the process in audit mode or <i>U</i> to update the database. The default is <i>A</i> .	A Audit U Update

TERM-----: 200010,200020,200030
UPDATE/AUDIT MODE: U
NUMBER OF UPDATES: 3
    
```

## Scheduler Work Table Purge Process (SSRSCPR)

**Description** This process is used to delete Scheduler Work Table (SSTSCHW) data based on the term and/or campus specified in the parameters.

Parameters	Name	Required?	Description	Values
	Term Code	Yes	Enter the term code for the data to be deleted.	Term Code Validation Form (STVTERM)
	Campus Code	No	Enter the campus code for the data to be deleted.	Campus Code Validation Form (STVCAMP)
	Update (U), Audit (A), Mode	Yes	Enter <i>A</i> to run the process in audit mode or <i>U</i> to update the database. The default is <i>U</i> .	U Update A Audit

```

## Section Fee Population Process (SSPMFEE)

**Description** This process examines the course/section characteristics defined in SSADFEE, determines the applicable sections based on those characteristics, and inserts the appropriate records in the SSRFEES table.

It is important to note that record insertions will only occur if no section level fees have already been defined. In the case where fee entries already exist in the SSRFEES table, no insertion of new or update of existing records will be made.

The report output displays the CRNs that were updated, the section characteristics from the fee used to create the SSRFEES records, and the total number of records inserted into the SSRFEES table. The section characteristics include department, college, campus schedule type, and instructional method. The fee information includes level, detail code, amount, and fee type. When the appropriate section is determined, the fee definition contained in SSADFEE is used to create a new fee record in the SSRFEES table. The report control information shows the term and run mode, as well as the count of sections that were updated.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term	Yes	Enter the term for which the section records are to be checked for incomplete registrations.	Term Code Validation Form (STVTERM)
	Run Mode	Yes	Enter <i>A</i> for an audit report or <i>U</i> to update the database. The default is <i>A</i> .	A Audit U Update

## Schedule Open Learning Rule Default Process (SSPRDEF)

**Description** This process defaults open learning rules for sections, as defined on SOAORUL, for CRNs that have been created after the rules have been established. Only those open learning sections where no corresponding rules have been defaulted to or entered in SSARULE (the SSRRSTS, SSRRFND, and/or SSREXTN tables) are updated by this process. This batch job uses the same rule defaulting criteria as the processing that occurs when a new section is created.

The report output displays the CRNs that were updated, the section characteristics from the rule used to create the SSARULE records, and the total number of records inserted into the SSRRSTS, SSRRFND, and SSREXTN tables. The report control information shows the term and run mode, as well as the count of sections that were updated.

Parameters	Name	Required?	Description	Values
	Term	Yes	Enter the term for which the section records are to be checked for missing open learning section level rules.	Term Code Validation Form (STVTERM)
	Run Mode	Yes	Enter <i>A</i> for an audit report or <i>U</i> to update the database. The default is <i>A</i> .	A Audit U Update

## Available Seats to Zero Process (SSRASTZ)

**Description** This process is used to modify the available seats for a CRN by setting the number of available seats to zero. This process can be run in Audit or Update Mode for a term or part-of-term and can specify CRNs by campus, subject, and course number. The process will change the maximum enrollment for a section (SSBSECT) to the same value as the number of students that are registered in the section. If reserved seats exist (SSRRESV), that capacity is also reduced for each rule.

Parameters	Name	Required?	Description	Values
	Term	Yes	Enter the term for the CRNs for which available seats are to be set to zero.	Term Code Validation Form (STVTERM)
	Part of Term	No	Enter the part of term for which specific CRNs are to be processed, or enter % for all parts of term.	Part of Term Code Validation Form (STVPTRM)
	Campus	No	Enter the campus for which CRNs are to be processed, or enter % for all campuses.	Campus Code Validation Form (STVCAMP)
	CRN	No	Enter one or more CRNs to be processed, or enter % for all CRNs.	
	Subject	No	Enter the subject for which CRNs are to be processed, or enter % for all subjects.	Subject Code Validation Form (STVSUBJ)
	Course	No	Enter the course number for which CRNs are to be processed. If a value has been entered in the Subject parameter, the Course parameter is required.	
	Run Mode	Yes	Enter <i>A</i> to produce an audit report or <i>U</i> to update the database. The default is <i>A</i> .	A Audit mode U Update mode

## General Person Procedures

---

### Establish Person

Before a person can become a recruit, applicant, student, instructor, advisor, or have an account, the person must first be identified to the system with an identification number and a name. A person is initially added to the system using the General Person Identification Form (SPAIDEN) which maintains a person's identification number, name, and address information. In addition to persons, the General Person Identification Form (SPAIDEN) is also used to enter non-persons, such as companies for billing third-party accounts.

### Common Matching Processing

Common Matching processing is used to prevent the creation of multiple PIDs for a single person or non-person in Banner®. Basic person APIs are used to provide common logic for how all PIDs are created. These APIs include: identification information (SPRIDEN), biographic and demographic information (SPBPERS), address information (SPRADDR), telephone information (SPRTELE), email information (GOREMAL), and emergency contact information (SPREMRG). You can turn Common Matching on and off as needed, either for the institution or for a specific user.

Common Matching uses a central, rule-based algorithm to check for possible database matches *before* a new person or non-person record is inserted into the SPRIDEN table. The same algorithm is used for new records created by data loaded via batch processes and data entered in online forms (such as SPAIDEN). A match package is used to perform the matching algorithm.

You can still perform searches from SPAIDEN before new records are inserted into the database. If a person or non-person record already exists, you can update it with new information from the current source, such as a new address type or a new email type. The existing record will not be overwritten. Alias tables in Banner General are used to store aliases (nicknames) for first and middle names, as well as non-person names. These aliases are used by the matching algorithm.

Forms in Banner General are used to set up Common Matching. You can enable the matching process at your institution using the **Online Matching Process Enabled (Indicator)** on the Installation Controls Form (GUAINST). If the matching process is

enabled on GUAINST, all users are required to perform matching. The Common Matching Entry Form (GOAMTCH) is used with SPAIDEN and other forms in Banner Student to enter information for a new ID and then execute the matching process before a new PIDM is created in Banner.

You can exempt selected users from the matching process on the Common Matching User Setup Form (GORCMUS). You can also set up user online matching source defaults on GORCMUS. You can build multiple rules on the Common Matching Rules Form (GORCMRL) for matching persons or non-persons, using fields and field lengths from a data dictionary. Special matching procedures can also be attached to rules allowing the algorithm to match on fields that are not common (i.e., high school data).

Common Matching specifically affects the SPAIDEN, SRAQUIK, SAAQUIK, SRIPREL, SAAEAPS, and SHAEDIS forms in Banner Student. The Common Matching Entry Form (GOAMTCH) is used with these forms as follows:

- Users who are not excluded on GORCMUS will see GOAMTCH automatically from SPAIDEN, SRAQUIK, and SAAQUIK. If they are excluded, data entry will remain the same as in previous Banner releases.
- GOAMTCH can be turned off when a new person is created on SPAIDEN, SRAQUIK, and SAAQUIK. It cannot be turned off when a new person is created on SRIPREL, SAAEAPS, or SHAEDIS.
- Data in the temporary tables behind SRIPREL, SAAEAPS, and SHAEDIS is copied to the GOAMTCH temporary table. If changes to that data are made on GOAMTCH, the changed data is copied back to the temporary tables for the calling forms and will be used by the calling forms (SRIPREL, SAAEAPS, or SHAEDIS) when a new record is loaded.
- For SRIPREL, SAAEAPS, and SHAEDIS, GOAMTCH is used to attempt to match data for a person in a temporary table to data for a person already created in Banner, before the person is loaded into Banner.
- The interface codes on STVINFC are associated with Common Matching rules using the **Common Matching Source** field. If the interface codes are not tied to a Common Matching source code, they will not be used in the matching process.

Please refer to the *Banner General User Guide* for more information on the Banner General forms used with this processing.

## Setting Up Common Matching

In order to use Common Matching at your institution, you *must* enable it using the **Online Matching Process Enabled (Indicator)** on the Installation Controls Form (GUAINST).

Use the following steps to set up Common Matching processing.

1. Create source codes.

Use the Common Matching Source Codes Validation Form (GTVCMSC) to create the various source codes that may be used in Common Matching. These are similar to the interface codes that exist in pre-7.0 Banner Student. Rules will be assigned to these source codes to be used with the matching algorithm.

2. Set up defaults for the source codes.

Use the Common Matching Source Code Form (GORCMSC) to set up the defaults to be used with a particular source code.

Be sure that you set up your matching source code on GORCMSC prior to setting up the rules associated with it on GORCMRL.

For example, you can assign default address, telephone, and email types to the source code which will default into GOAMTCH if the source code is used from there. GORCMSC is also used to identify whether the source code will be used to perform matching against person data and/or non-person data and whether the source code can be used with online matching. Optionally, you can designate other specific forms a user can navigate to in order to see more detailed information about possible matched records by using the **Details** button on GOAMTCH.

3. Assign default online matching source codes to a user ID.

Use the Common Matching User Setup Form (GORCMUS) to assign a default online matching source code to a specific Oracle user ID. In addition, you can specify whether a specific user ID is allowed to choose from other matching source codes, or if they are restricted to using just the default source code. You can also indicate if a specific user ID is excluded from having to use online Common Matching.

For example, if a user is a “super-user” who never creates duplicate PIDM records, they may be exempted from having the GOAMTCH form appear from SPAIDEN by checking the **Exclude User (Indicator)**.

4. Set up the matching rules associated with the source codes.

The Common Matching Rules Form (GORCMRL) is used to set up the actual matching rules associated with the source codes.

Use this form to create each rule, assign a priority to it, and then assign the specific database fields to each rule which will be used by the matching algorithm. You can also copy previously created rules, as well as add specific procedures for matching components that are not contained within Banner General (i.e, matching on high school data for Banner Student). If a field is to be included in a rule but is not required, the field is specified as *Exists* on GORCMRL.

## How the Matching Process Works

When you enter an ID on SPAIDEN that does not exist in Banner and then execute the matching process, you can receive a match status of “New”, “Match”, or “Potential Match”.

### New Records

Records are matched with a status of “New” if no records match, based on the rules that have been set up. When a record is identified as being new, the General Person APIs are used to insert the data into SPRIDEN, SPRADDR, SPRTELE, SPBPERS, and/or GOREMAL. Once the record is made new, you are returned to SPAIDEN.

### Matched Records

Records are matched with a status of “Match” if one, and only one, record in Banner matches the incoming person based on the rules that have been set up.

Data for the matched PIDM is displayed for review by the user. You can select the matched record and return to the main window of SPAIDEN, or you can update the matched person with data entered in the Data Entry block on GOAMTCH before returning to SPAIDEN.

### Potentially Matched Records

Records are matched with a status of “Potential Match” (or “Suspense”) if some, but not all, fields match someone in Banner based on the rules that have been set up. For example, the first and last names for the record match, but the date of birth does not match.

You can create the person as “New”, or you can select one of the potentially matched records as the “Match”.

### Rule Examples

Here is one set of rules that can be used in Banner Student.

Priority	Column Name	Data Element	Length	Required/Exists
1	SPRIDEN_SEARCH_LAST_NAME	LAST NAME/NON-PERSON NAME	10	Required
	SPRIDEN_SEARCH_FIRST_NAME	FIRST NAME	10	Required
	SPBPERS_SSN	SSN/SIN/TIN	9	Required
	SPBPERS_BIRTH_DAY	DATE OF BIRTH DAY	2	Exists
	SPBPERS_BIRTH_MON	DATE OF BIRTH MONTH	2	Exists

Priority	Column Name	Data Element	Length	Required/Exists
	SPBPERS_BIRTH_YEAR	DATE OF BIRTH YEAR	4	Exists
	SPRADDR_ZIP	ZIP/POSTAL CODE	5	Exists
2	SPRIDEN_SEARCH_LAST_NAME	LAST NAME/NON-PERSON NAME	10	Required
	SPRIDEN_SEARCH_FIRST_NAME	FIRST NAME	10	Required
	SPBPERS_SSN	SSN/SIN/TIN	9	Exists
	SPBPERS_BIRTH_DAY	DATE OF BIRTH DAY	2	Exists
	SPBPERS_BIRTH_MON	DATE OF BIRTH MONTH	2	Exists
	SPBPERS_BIRTH_YEAR	DATE OF BIRTH YEAR	4	Exists
	SPRADDR_CITY	CITY	10	Exists
	SPRADDR_ZIP	ZIP/POSTAL CODE	5	Exists
3	SPRIDEN_SEARCH_LAST_NAME	LAST NAME/NON-PERSON NAME	10	Required
	SPRIDEN_SEARCH_FIRST_NAME	FIRST NAME	10	Required
	SPBPERS_BIRTH_DAY	DATE OF BIRTH DAY	2	Exists
	SPBPERS_BIRTH_MON	DATE OF BIRTH MONTH	2	Exists
	SPBPERS_BIRTH_YEAR	DATE OF BIRTH YEAR	4	Exists
	SPRADDR_CITY	CITY	10	Exists
	SPRADDR_ZIP	ZIP/POSTAL CODE	5	Exists

## Matching Algorithm

The matching algorithm used with Common Matching processing is composed of two matches - primary and secondary. The primary match selects a pool of Banner records that may match based on first, middle, and last name, and/or SSN and ID. If a record is selected as part of the primary match, then at a minimum it will be a potential match. The secondary match then looks at all the records from the primary match pool and uses the rest of the fields in the matching rule to see if only one record matches exactly. If only one record matches exactly, that record is a match. If more than one record matches, then all those records that match or partially match become the potential matches.

An exception to this process is if an incoming record has passed the primary match, but all of the other non-name elements included in the matching rule do not match (and none of the fields are null), then the person is made new.

For example, a rule could be set up as follows:

Element	Required	Length
Last Name	Required	10
First Name	Exists	8
City	Exists	8
ZIP	Exists	5
Date of Birth	Exists	

Banner contains a SPRIDEN record for Joseph Smith in Tampa, FL, born on April 11, 1982. The incoming record is also for a Joseph Smith who lives in Boston, MA, and who was born on August 18, 1981. Assuming there were no other Joseph Smiths in the Banner database, the incoming record would be marked *New*. It would normally have been marked as *Suspended*, because the first and last names matched, but as the rest of the elements in the rule (City, ZIP, Date of Birth) specifically did not match, the person was made new.

## How the Algorithm Works

The Common Matching algorithm allows for the processing of multiple rules. Priority numbers must be defined for each rule indicating the sequence in which they are to be processed. The strictest rule should be assigned the first priority (i.e., #1). The algorithm will process each rule in order, separately and completely.

- The first step performed by the algorithm is primary matching for the rule. This step defines the population on which the rest of the processing (secondary match) will be performed. If no match occurs during the primary match, then the external record is considered to be new.
- The second step performed by the algorithm is secondary matching processing against the results of the primary match. If the secondary match determines an exact match on only one record, the external source record is considered to be a match.

If more than one record is matched to the criteria, the external source record is considered to be in suspense. The external source record will be considered to be in suspense if data matches part of the criteria of the rules but does not match all the criteria. If the results of the rule are new or matched, the results are returned to the calling process. No other rules are processed.

When all the rules have been processed, the algorithm will interrogate the results and return the results to the calling process. The match status (new, matched, or suspense) will be returned, as well as a results message providing the elements that were matched, not matched, or missing as a result of processing the rule.

When processing online, if a record is determined to be a match using one rule but to be in suspense using one or more additional rules, the record's match status will be set to match, but the user will still be able to view the potentially matched records.

## Rule Indicators

The **Data Required** field on GORCMRL can be set to *Exists* or *Required*.

- A value of *Required* indicates that the data field associated with the indicator is required and must be present on the external source and in Banner. If the field on either the external source or in Banner is null for a data element with the **Data Required** field set to *Required*, then the data element is considered to be not matched. If all data elements are required, but all of the data elements in the secondary match are null either in Banner or the external source, the record will be suspended for review.
- A value of *Exists* indicates that either the external source or the Banner value can be null. If either or both values are null, the field is considered to be a match.

## Rule Priorities

The algorithm processes each rule that has been defined for the data source separately based on the priority given in the Rule Priorities block. If the priority rule determines that the input record is either *New* or *Matched*, that status is the overall status that is returned for the record.

### Note

For online processing, the potential matches that result from processing the rules may be viewed online from the Potential Matches block on the Common Matching Entry Form (GOAMTCH). Potential matches are listed in order by rule priority. ■

## Field Length Values

Whenever a length is specified for a rule on the Common Matching Rules Form (GORCMRL), the comparison is made using the rule length of the fields. For example, using the last name, the comparison would be between the rule lengths of the last name on the external source to the rule length of the last name in Banner. If the rule length is five, then the first five characters of the external source last name are compared to the first five characters of the Banner last name.

A negative length may be entered for the ID and SSN/SIN/TFN to reverse the order from last to first. For example, if -5 is entered for the length of the SSN/SIN/TIN, the last five

characters of the external source SSN will be compared to the last five characters of the Banner SSN/SIN/TIN.

For example, for the rule below:

Last Name length = 4

First Name length = 3

SSN/SIN/TFN length = -4

Patricia Longnecker, SSN/SIN/TFN #555116789

The results would be:

The first four characters of the last name would be used: LONG

The first three characters of the first name would be used: PAT

The last four characters of the SSN/SIN/TFN would be used: 6789

 **Note**

For performance reasons, SunGard® Higher Education recommends that you not use negative lengths for SSN/SIN/TIN. ■

## Primary Matching Logic

The primary matching process uses Last Name/Non-Person name (SPRIDEN\_SEARCH\_LAST\_NAME), which is a required data element for Common Matching. If First Name (SPRIDEN\_SEARCH\_FIRST\_NAME) or Middle Name (SPRIDEN\_SEARCH\_MI) are specified data elements in a rule, these will also be used as part of the primary match for the name. In addition, if ID (SPRIDEN\_ID) and/or SSN/SIN/TFN (SPBPERS\_SSN) are specified data elements in a rule, they will be used as part of the primary match.

The Common Matching process will use the **Match Type (Indicator)** setting that has been established for the matching source on the Common Matching Source Code Rules Form (GORCMSC) to determine which records are to be selected in Banner.

- When the **Match Type (Indicator)** is set to *Person*, person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *P*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *P*.
- When the **Match Type (Indicator)** is set to *Non-Person*, non-person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *C*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *C*.
- When the **Match Type (Indicator)** is set to *Both*, person and non-person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *B*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *P* or *C*.

The following steps are used in the primary matching process:

*Either Step 1 or Step 2 below must be true for a record to pass the primary match. If the external record fails the primary match, then the match status will be marked as new.*

1. If the SSN/SIN/TFN is defined for the matching source and rule priority number, retrieve all records from Banner with a matching SSN/SIN/TFN.

The SSN/SIN/TFN data element is defined as part of the rule, and the SPBPERS\_SSN is equal to the external source SSN/SIN/TFN.

2. If First Name and/or Middle Name are defined for the matching source and rule priority number, combine them with the Last Name criteria, and retrieve all records from Banner with a matching name.

 **Note**

When matching non-person records, the First and Middle Names should not be included as part of the rule. ■

- 2.1. The following must be true:

SPRIDEN\_SEARCH\_LAST\_NAME must equal the last name on the external source for the specified length.

 **Note**

If the matching source is defined to match non-person records, and SPRIDEN\_SEARCH\_LAST\_NAME is not like the non-person name from the external Source, the matching algorithm will check to see if a matching record exists on the GORPNM alias table. ■

- 2.2. One of the following must be true:

First Name data element is not defined.

*or*

First Name data element is defined for the rule, and SPRIDEN\_SEARCH\_FIRST\_NAME is equal to the external source first name for the specified length.

 **Note**

If the SPRIDEN\_SEARCH\_FIRST\_NAME is not like the first name from the external source, the matching algorithm will check to see if a matching record exists on the GORNAME alias table (if the matching source is defined to match person records). ■

2.3. One of the following must be true:

Middle Name data element is not defined.

*or*

Middle Name data element is defined for the rule, and `SPRIDEN_SEARCH_MI` is equal to the external source middle name for the specified length.

 **Note**

If the `SPRIDEN_SEARCH_MI` is not like the middle name from the external source, the matching algorithm will check to see if a matching record exists on the `GORNAME` alias table (if the matching source is defined to match person records). ■

3. If ID is defined for the matching source and rule priority number, retrieve all records from Banner with a `SPRIDEN_ID` that is equal to the external source ID.

### Secondary Matching Logic

The secondary matching process compares the data elements defined for the matching source and rule priority number for all records returned by the primary matching process. The goal of the secondary match is to find an exact match between the external source record and a Banner record.

When comparing a data field that has the **Data Required (Indicator)** set to *Exists*, a null value may exist either in Banner or the external source. If a null value exists either in Banner or the external source for the data element, the data element is considered to be matched.

When the **Data Required (Indicator)** is set to *Required*, if a null value exists either in Banner or the external source for the data element, the data element is considered to be not matched.

This step is repeated for each of the data elements for the rule, and one condition must be true for each for an external source record to be considered to be a match.

- Data element is not defined.
  - Data element **Data Required (Indicator)** is set to *Exists* or *Required*, and the Banner value is equal to the external source value for the specified length.
- or*
- Data element **Data Required (Indicator)** is set to *Exists*, and the Banner value is null.
- or*
- Data element **Data Required (Indicator)** is set to *Exists*, and the external source value is null.

When the data being matched is part of a logical unit (such as an address), the logical unit is matched separately and completely. For example, when matching on city and ZIP code, the city and ZIP code must be associated with one address.

 **Note**

There is an *exception* to be aware of. For an external source record to be considered as new when the record has already passed the primary match, all non-name data elements must be determined as not being a match, and none of the non-name elements may be null. ■

## Examples of Matching Algorithm Process and Results

Here are some examples of how the matching algorithm works.

### **Example 1:**

If all required data elements are missing, the record will be suspended.

Last Name = Required

First Name = Required

Date of Birth Day = Required

Date of Birth Month = Required

Date of Birth Year = Required

City = Required

*Banner values:* Mildred Jones, Date of Birth = 08/17/1957, City = Topeka

*External values:* Mildred Jones

The external record will pass the primary match, because the first and last names match. However, since all other data elements are missing (i.e., null) from the external source (not matched but are null), the record will be suspended.

### **Example 2:**

The external record passes the primary match as the first and last name matches against two Banner records. These two records are then used in the secondary match.

#### **Rule 1**

Last Name = R

First Name = Y

SSN = Y

#### **Rule 2**

Last Name = R

First Name = Y

Date of Birth = Y

**Rule 1**

Date of Birth = Y

City = Y

ZIP Code = Y

**Rule 2**

City = Y

ZIP Code = Y

The value *R* stands for *Required*. The value *Y* stands for *Exists*.

*Banner values:*

Record 1 - Alberta Rockville, 330229101, Largesse, 06259, 05/01/1985

Record 2 - Alberta Rockville, no SSN, Pomfret, 19355, no Date of Birth

*External values:* Alberta Rockville, 330229101, Largesse, 06259, no Date of Birth

The external record will pass the primary match, because the first and last names match at least one Banner record with the same first and last names.

- Using Rule 1 and the matching algorithm, the external record will be matched against Banner record 1. It will be suspended against Banner record 2.
- Using Rule 2, the external record would be matched against Banner record 1, since the Date of Birth is missing and the City and ZIP match.

**Example 3:**

The external record passes the primary match, which usually means that the match status will be *Suspense* at a minimum. However, in this case, because none of the non-name/SSN fields match, the external record has a match status of *New*.

**Rule 1**

Last Name = R

First Name = R

SSN = Y

Date of Birth = Y

City = Y

ZIP Code = Y

**Rule 2**

Last Name = R

First Name = R

Date of Birth = Y

City = Y

ZIP Code = Y

The value *R* stands for *Required*. The value *Y* stands for *Exists*.

*Banner values:* Tomasso Dalimonte, SSN = null, Date of Birth = 06/02/78, City = Marikesh, ZIP = 11233

*External values:* Tomasso Dalimonte, SSN = null, Date of Birth = 09/07/59, City = Woodstock, ZIP = 06281

The external record will pass the primary match, because the first and last names match. Normally, this would mean that the record would be suspended at a minimum. However, because the Date of Birth, City, and ZIP Code fields specifically do not match (i.e., none of them are null), then the record's match status is set to *New*. This is the only exception to the basic matching algorithm.

## Forms Used with Matching Process

### Common Matching Entry Form (GOAMTCH)

Use this form to prevent the creation of multiple PIDMs for a single person or non-person in Banner. It is used with SPAIDEN and other forms in Banner Student to enter information for a new ID and then execute the matching process before a new PIDM is created in Banner.

If Common Matching is turned on (on GUAINST), and the user is not excluded from Common Matching on GORCMUS, GOAMTCH is called automatically from the Key Block of SPAIDEN, SRAQUIK, SAAQUIK when an ID is generated or entered, and the ID does not already exist in Banner. Whether or not Common Matching is turned on, the user will access GOAMTCH from SRIPREL, SAAEAPS, and SHAEDIS as part of the matching process for data loads.

You can enter information for name, address, telephone, date of birth, SSN, etc., in the Data Entry block. The data entered can be used to assist with matching if the matching rule contains the field being entered. Regardless, the data entered in the Data Entry block will be stored in Banner if the person is found to be new.

The matching process is called when you perform a Next Block from the Data Entry block or select the **Duplicate Check** button. Use the **Duplicate Check** button to execute the matching process at any time during the entry of person information. Only those data elements in this form can be used for online matching rules.

#### **Note**

If GOAMTCH is called from another form where you can create identification records, the **GENERATE ID** button does not appear in the Key Block. ■

### **Wildcards and Special Characters**

You can use this form to search for identification records, and you do not need to use wildcard characters (%). You can enter partial information without using a wildcard character.

The programming logic treats *searching* and *creating* data differently:

- If you enter % in the **First Name** field, for example, and create a new record, % will be stored as the person's first name.
- If you use a wildcard to search for a record, the Common Matching process will strip it out. The process removes special characters and forces the data to be uppercase.

For example, if you search for *Jon%s*, the Common Matching process will search for *JONS*, and *Jones* will not be considered a match.

First name is required for all searches for person records. If you want to search on last name only, you can enter the last name, and enter a special character for the first name.

### **Button Detail**

The following buttons are used on GOAMTCH:

- **Duplicate Check**

Select this button to trigger the Common Matching process without performing a Next Block function.

- **Select ID**

Select this button if Common Matching has found an existing record that is a match for the one you are entering. This populates the form on which you were entering data with the existing Banner data for that person or non-person. You are automatically taken back to the original form, and a new PIDM is not added to the database.

- **Details**

Select this button if Common Matching has found potential matches and you need to do additional research to see if any of them match the record you are adding. A list of forms will appear, from which you can select the form you wish to access.

### **Note**

The list of research forms displayed by selecting the **Details** button is determined by how the matching source code is set up on the Common Matching Source Code Rules Form (GORCMSC). If you do not set up any forms to be called, the **Details** button will be disabled. ■

- **Update ID**

Select this button if Common Matching has found a record that matches the one you're entering, and you have entered information in GOAMTCH that should be added to the existing record. Only null fields on the existing Banner record will be updated. The record is changed, but a new PIDM is not added to the database.

For example, if Common Matching finds the person's record but there is no billing address, and you have added the billing address in the Data Entry block, selecting this button will add a billing address record to the existing address records.

- **View Comments**

Select this button to view non-technical details about the matching source and related rule sets from GTVCMSC to better understand the type of data that should be entered in GOAMTCH and the matching results that are produced.

- **Create New**

Select this button if the Common Matching process does not return a record that matches the one you are entering, or if none of the potential matches that was returned matches the record you are entering. This creates a new PIDM in Banner. If biographical data, email address, telephone number, or complete address information has been entered in the Data Entry block, the corresponding records will be created in Banner.

You can restrict whether a new ID is created or not if any APIs fail due to missing or incomplete information, and an error message is generated. When the **Create New** button is used, the system checks to see if any APIs have failed. If the new **Prevent ID Creation on API Failure** checkbox on GORCMSC is checked, the appropriate error message will be displayed, and you will be prompted to enter the missing or incomplete information to complete the creation of the new ID. (The default value is unchecked on GORCMSC).

**Note**

This functionality can only be used online. It is not available in batch processing. ■

The following results will occur when the **Duplicate Check** button is used:

1. The record is *new*. No match has been found in the database. The record can be created without any additional processing, and Banner will assign a new PIDM to it.
2. A *match* is found for the record. Common Matching has found one, and only one, Banner record that matches the record based on the rules. The Common Matching Entry Form (GOAMTCH) appears with the Match tab highlighted. The user must review the displayed data to see if the matched Banner record is the same as the one they are trying to enter.
  - 2.1. If the record found in the database is the same as the one being entered, you can select the person or non-person as a match, or update the record with additional information, but Banner will not assign a new PIDM.

**Note**

You can only update fields on an existing Banner record if they are null in the Banner database. If data already exists for those fields, it will not be overwritten. ■

- 2.2. If the record found in the database is not the same as the one being entered, you can create a new record. Banner will assign a new PIDM to the record when it is saved.

3. A *potential match* is found. Common Matching has found at least one record where some of the fields identified in the rule match the record being entered, but not all.

For example, the first name and last name are the same, and the mailing address is the same, but the date of birth is different. GOAMTCH then appears with the Potential Matches tab highlighted. You can review each potential match to determine if one is, in fact, a match. If multiple records meet the matching criteria, they are all displayed in the Potential Matches block.

- 3.1. If one of the potential matches is the same as the one being entered, you can select the record as a match, or update it with additional information. Banner will not assign a new PIDM. If the record is updated, existing data will not be overwritten.
- 3.2. If none of the potential matches is the same as the one being entered, you can create a new record. Banner will assign a new PIDM to the record.

### **Key Block**

Use this block to enter the ID to be matched and the matching source code for the match rules to be used in the search.

Two buttons are used in this block.

- The **Generate ID** button is used to generate a new one-up Banner ID.
- The **View Comments** button is used to view matching source and rule details.

### **Data Entry Block**

Use this block to enter the information for the person or non-person, unless it has been populated automatically from the original form where you were working (i.e., SRIPREL). You can enter either the SSN or the last name/non-person name for matching. The last name is not required. (You should only use the SSN without last name in matching rules sets for online matching. It should not be used in batch processing.) The Common Matching algorithm will use the rules for the matching source to see if an identification record already exists in the database for that person or non-person.

You have the option of displaying potential matches using the data entered on GOAMTCH, even if the number of characters entered is less than the length specified in the matching rule on GORCMRL. Use the **Allow Length Override** checkbox on GORCMSC to capture any matches up to and including the specified length on for the rule. For example, if you enter a last name with four characters, and the **Length** field on GORCMRL has been set to 5 for the rule, the system would display any records where the last name begins with the four characters entered on GOAMTCH.

Records are held in suspense, as partially matched, and you can use the following buttons to continue processing.

- The **Duplicate Check** button is used to execute the match algorithm from the Data Entry block and run it as needed until the match is satisfactory.
- The **Select ID** button is used to match the ID in the Data Entry block to the ID in the Match block.
- The **Details** button is used to display a list of forms for additional match research.
- The **Update ID** button is used to match the ID in the Data Entry block to the ID in the Match block and insert data into null fields in the SPBPERS, SPRADDR, and/or GOREMAL tables.
- The **View Comments** button is used to view matching source and rule set details.
- The **Create New** button is used to reject all matches and create the record as new.

### **Match Block**

The Match block is automatically displayed after the matching process is completed if a match is found. This block is accessed using Next Block or the Match tab. The data entered remains in the Data Entry block. You can choose to clear the match information using the **Clear and Return to Data Entry** button. You will then be returned to the Data Entry block where you can add or change the data for the match. The address information in the Match block displays the address type and address data, if the address was matched as part of the matching algorithm.

If the record found by the matching process is a match for the record being entered, use the **Select ID** button to bring the information back to the form on which you were entering data, or use the **Update ID** button if you have added information to the Data Entry block that does not exist in the database record. If you have a large number of potential matches, you may want to select the **Clear** button to erase the information in this block and enter more restrictive criteria in the Data Entry block.

You can enter additional information to reduce the number of potential matches found by the Common Matching process. To see the new list of potential matches, you must execute the process again by performing a Next Block function or selecting the **Duplicate Check** button.

#### **Note**

The Common Matching process uses the rules defined for the **Matching Source** in the Key Block to determine if the identification record being entered already exists on the Banner database. If you do not receive the results you expect after the Common Matching process has been executed, review the rules for the **Matching Source** on GORCMRL. ■

## Potential Matches Block

The Potential Matches block displays the potential matches (formerly known as suspense records) found during the search. The number of PIDM records found is displayed in parentheses in the tab, i.e., “Potential Matches (42)”. You can scroll through the potential match records to see the information in each that potentially matches the information in the Data Entry block. Only one row per record is displayed in this block. You can choose to clear the match information using the **Clear and Return to Data Entry** button. This clears the data in the Potential Matches block so you can add or change the data for the potential match.

Logical sort order processing can be used to sort the matching results dynamically by ID or name in ascending or descending order using the **Sort** up and down arrow buttons for the **ID** and **Name** fields. The default sort order is by ID and priority (in descending order).

When you click on the **Sort** up arrow, the sort organizes the results in alpha order (A - Z). When you click on the **Sort** down arrow, the sort organizes the results in reverse alpha order (Z - A). Once you have clicked on an up or down arrow, you can mouse over the arrow to see the tool switch hint message, click on the arrow again, reverse its direction, and perform a new sort. For example, after you have sorted on ID or name in A - Z order (using the **Sort** up arrow), you can then click on the arrow again to change it to a **Sort** down arrow, and resort the data in Z - A order.

If any address fields are included in the matching rules being used, and a match exists on the address of a potential match, then that address will be displayed for that record. To see all address records for a selected potential match, select the **All Addresses** pulldown list.

### Note

If you use GOAMTCH by itself to match a person to an existing person in Banner, and the existing person in Banner has an address of the same address type (where the addresses themselves do not match), the existing Banner address will be inactivated, and the address that was entered on GOAMTCH will be inserted.

If you use SAAEAPS or SRIPREL to match a person via GOAMTCH and the same scenario exists, SRIPREL and SAAEAPS will put an end date on the existing Banner address and then insert the new address. ■

If the matching rule contains a row for telephone number and/or email address, and a match exists on the telephone number or email address of a potential match, then the phone number and/or email address will be displayed. The date of birth and gender will be displayed for any potential match if they exist in Banner for the potentially matched record, regardless of whether date of birth or gender are used in the matching rule.

You can define a hierarchy for the display of addresses, telephone numbers, and email addresses. This hierarchy will be used for two conditions: 1) when no address fields are used in the rule set, and/or 2) when address rules are used in the rule set, but the potential match record does not have an address that matches.

- If address information has been included in a matching source rule set, and the potential match record has an address which matches, that address will be displayed in the Potential Matches block.
- If address information has been included in a matching source rule set, and the potential match record has no address which matches, and a hierarchy has been established for the matching source, and the potential match record has an address type listed in the hierarchy, that address will be displayed in the Potential Matches block.
- If address has been included in a matching source rule set, and the potential match record has no address which matches, and a display hierarchy has been established for the matching source, and the potential match record has no address types listed on the hierarchy, the message *No Matching or Hierarchy Found* will be displayed in the **Matching or Hierarchical Address** field.
- This same logic is true for the telephone and email address information. If there is no match or hierarchical type associated with the record, the message *No Matches* will be displayed in the **Telephone** and **E-mail** fields. (This message is shorter, as these field lengths are smaller.)
- The address source code data is passed from GOAMTCH to the GOTCMME table. The value in the GOTCMME\_ASRC\_CODE column is loaded to the SPRADDR\_ASRC\_CODE column in GOAMTCH using the gb\_address API.

The **Matching Rule Sets** field displays the result of the matching algorithm for each field included in the matching rule. This allows a user to know what data elements the matching rule was using, even if they do not have access to the Common Matching Rules Form (GORCMRL).

For example, you could view how the data for specific fields is displayed for all potential matches, even though those fields do not exist in the matching rules. You could also view the fields included in the matching rule, such as: *Name Match, Address Match, Email Match*. In addition, you could view all the Banner addresses for the selected potential match using the **All Addresses** field pulldown list. A record could show an email match, even though none exists. That occurs if the matching rule on GORCMRL has the **Element** field set to *Email* and the **Data Required** field set to *Exists*. A null email address on either the Banner record or the incoming record is still considered to be a match.

To find more information about a record, select it and then select the **Details** button in the Data Entry block. A list of forms will be displayed, and you can select the form you wish to access.

## General Person Identification Form (SPAIDEN)

You can access the Common Matching Entry Form (GOAMTCH) from SPAIDEN. To do this, turn on Common Matching for the institution using the **Online Matching Process Enabled (Indicator)** on GUAINST. In addition, the user attempting to access GOAMTCH must not have been excluded from using it on GORCMUS. However, even if a user has been excluded from Common Matching on GORCMUS, they can still access

GOAMTCH through the Banner General Common Matching Menu (\*GENMATCH) or through the Options Menu.

To open GOAMTCH from SPAIDEN: type *GENERATED* in the **ID** field, select the **Generate ID** button, or enter an ID in the **ID** field that does not exist in Banner. The GOAMTCH form will automatically appear. If a person record is created using only the GOAMTCH form, the **Origin** field (on SPAIDEN and SPRIDEN) will be set to *GOAMTCH*. If the person record is created using SRRSRIN or SRIPREL, then the **Origin** field will be set to *SRKPREL*.

### Quick Recruit Form (SRAQUIK)

GOAMTCH will be called automatically from SRAQUIK if Common Matching has been turned on in GUAINST and if the user has not been excluded from Common Matching on GORCMUS. To open GOAMTCH from SRAQUIK: enter *GENERATED* in the **ID** field, select the **Generate ID** button, or enter an ID in the **ID** field that does not exist in Banner.

If the user has been excluded from Common Matching, and they enter *GENERATED* in the **ID** field, select the **Generate ID** button, or enter an ID in the **ID** field that does not exist in Banner, the Current Identification window will be displayed, allowing the user to enter a new person's first, middle, and last name.

### Quick Entry Form (SAAQUIK)

GOAMTCH will be called automatically from SAAQUIK if Common Matching has been turned on in GUAINST and if the user has not been excluded from Common Matching on GORCMUS. To open GOAMTCH from SAAQUIK: enter *GENERATED* in the **ID** field, select the **Generate ID** button, or enter an ID in the **ID** field that does not exist in Banner.

If the user has been excluded from Common Matching, and they enter *GENERATED* in the **ID** field, select the **Generate ID** button, or enter an ID in the **ID** field that does not exist in Banner, the Current Identification window will be displayed, allowing the user to enter a new person's first, middle, and last name.

## Data Loads Used with Matching Process

### Electronic Prospect Inquiry Form (SRIPREL)

SRIPREL uses the GOAMTCH form and the Common Matching algorithm for data load processing to determine if the incoming record matches an existing Banner record.

Use the following steps to resolve suspended records or to match and load new records from SRIPREL.

1. Query for prospect records (where the **Match Status** is *S* for “suspended”), or by other parameters.

2. If you want to view details about the selected record, choose the Details (SRAPREL) item from the Options Menu. If you want to use the matching algorithm against the selected record, then choose the Match (GOAMTCH) item from the Options Menu.
3. Before you can access GOAMTCH, you will be asked to assign an ID to the new user, either a generated ID or the person's SSN. When the data is saved, you will be taken to GOAMTCH.
4. When you enter GOAMTCH, the **ID** field will contain either the word *GENERATED* or the selected record's SSN. The **Matching Source** field will contain the matching source code that has been assigned to the interface code, which is also assigned to the electronic prospect code of the selected record on STVPREL.

If no matching source code has been assigned to the interface code, then the **Matching Source** field will contain the default matching source code that has been assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, then you will be able to select any matching source code from the List of Values.

5. Perform a Next Block to populate the Data Entry block with all of the data for the incoming prospect record that is present in the temporary tables.
6. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the prospect's record is created.
7. Perform a Next Block to run the matching algorithm. The algorithm will determine if the incoming record is new, matched, or a potential match.
8. Determine if the record is to be new or matched, and select the appropriate button.
9. The user will be automatically returned to SRIPREL. The match status will *always* be *Matched*, as the person has now been created in Banner via GOAMTCH. Continue with regular SRIPREL load processing.

### **Electronic Prospect Match (SRRSRIN) and Migrate Electronic Prospects Process (SRRPREL)**

Users should review how Common Matching works with electronic prospect processing when using SRRSRIN and SRRPREL.

SRRSRIN will not load recruits to Banner when the Auto Load (Skip Dup Chk) parameter is set to *Y* and data does not conform to API restrictions. When records with a matched (*M*) or new (*N*) status are flagged, the records will not be loaded to Banner when the Auto Load (Skip Dup Chk) parameter is set to *Y* if information required to create the record (such as an address) is incomplete.

SRRSRIN will flag records with incomplete addresses or other incomplete information as having a status of suspense (*S*), and these suspended records will need to be fixed manually on SRIPREL and/or GOAMTCH. It is very important to fix the incorrect and/or missing information at this point, prior to continuing with the matching process. If the incomplete data is not corrected, SRRSRIN will fail.

 **Note**

SRRSRIN is the only process that generates records with a match status of *N*. All records that are processed manually on SRIPREL using GOAMTCH will have a match status of *M*, even when you choose to create a new record. This is due to the fact that when you return to SRIPREL, the person's record will have been created in Banner by GOAMTCH. ■

Here is an example of SRRSRIN output when incomplete addresses are found after the process is run with the Auto Load (Skip Dup Chk) parameter set to *Y*.

ID	Name	Status	Term	Level	Major	High School	Result
P00002378	Adams, Adam	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00024505	Adams, Alison	M	199510	UG	ARTS	UNKNHS	Loaded 29-NOV-2004
P00002429	Adebowale, Morayo	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00027348	Albert, Dawn	M	199510	UG	ARTS	UNKNHS	Loaded 29-NOV-2004

When SRRSRIN is run with the Auto Load (Skip Dup Chk) parameter set to *N*, there is no address check, so records will be flagged as matched (*M*) or new (*N*), whether they have complete address information or not.

Since records on a tape with incomplete data such as incomplete addresses will not be loaded to Banner, SRRPREL works so that records that were flagged *N* or *M* and also have incomplete data will have the match status changed to *S*. Again, these suspended records will need to be fixed manually on SRIPREL and/or GOAMTCH. It is very important to fix the incorrect and/or missing information at this point, prior to continuing the matching process. If the incomplete data is not corrected, SRRSRIN will fail.

Here is an example of SRRPREL output when incomplete addresses are found after SRRSRIN is run with the Auto Load (Skip Dup Chk) parameter set to *N*.

ID	Name	Status	Term	Level	Major	High School	Result
A00023291	Abrams, Anthony	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00024505	Adams, Alison	M	199510	UG	ARTS	UNKNHS	Loaded 30-NOV-2004
A00027662	Martinez, Robert	S	199510	UG	ARTS	UNKNHS	Prospect not loaded

When using SRIPREL, if an attempt is made to load a matched (*M*) or new (*N*) record (the Create Recruit item is selected from the Options Menu), and data is incomplete, an error is displayed in the autohint: *Error: Data Error. Prospect has been put into suspense.* At this point the match status for the record is changed back to *S*. You can then navigate to GOAMTCH to update the incomplete data (such as missing address information) and match the record appropriately.

When records are matched through batch processing, SRTLOAD loads the address source from the temporary tables to the SPRADDR table. SRRSRIN then calls SRKPREL to push the address data, and therefore loads the SRTADDR\_ASRC\_CODE value to the SPRADDR\_ASRC\_CODE field.

When matching is performed manually using SRIPREL and GOAMTCH, SRIPREL saves the prospect's address to the GOTCMME table. GOAMTCH then creates the address for the new person record from the GOTCMME table, including the ASRC\_CODE data.

### Electronic Application Process Form (SAAEAPS)

SAAEAPS uses the GOAMTCH form and Common Matching algorithm to assist in matching incoming Web and EDI application records to existing Banner records.

Use the following steps to resolve suspended records or to match and load new records from SAAEAPS.

1. Query for the admissions records that have been suspended (where the **Application Status** is *U* for “suspended”), or by any of the other fields.
2. Set the **Accepted Indicator** to *Y* if it is still set to *U*.
3. Select the Verification Steps tab or the Manual Verification Steps option from the Options Menu to access the Verification Steps window.
4. Mark any of the person or application steps complete, except for the *IDVR* step, and then save the changes.
5. Select the *IDVR* step, and then choose the Associate Person with ID item from the Options Menu.
6. This opens the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record.
7. After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display GOAMTCH.
8. The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.

9. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
10. Once the data has been "cleaned up", use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
11. The incoming electronic application can be a match, a potential match, or a new record:
  - 11.1. If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - 11.2. If the incoming electronic application is found to be a potential match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - 11.3. If the electronic application is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.
12. If the person is found to be an exact match, you can do one of three things:
  - 12.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 12.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.
  - 12.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
13. After selecting one of the options above, the user will be returned to the Verification Steps window, and the *IDVR* step will be marked as complete. Continue processing the electronic applicant as needed.

### Online Transcripts Activity List Form (SHAEDIS)

SHAEDIS uses the GOAMTCH form and the Common Matching algorithm to assist in matching incoming records to existing Banner records. In addition, you can create a new person record from GOAMTCH for the person on SHAEDIS.

Use the following steps to determine if a person on SHAEDIS matches an existing Banner record or if the person can be created as a new record.

1. Query for those records where the **Status** is *VERF* and the **Pending or Complete Indicator** is set to *P*.
2. Select the record to be matched. Perform either a Next Block function, or select Verify ID from the Options Menu to call GOAMTCH.
3. The form will display the ID of the record from SHAEDIS. If this ID already exists in Banner, then you must replace the ID with the word *GENERATED*. This will allow GOAMTCH to use a generated ID if the person selected on SHAEDIS is new to Banner.
4. The value in the **Matching Source** field will be defaulted from the **Online Matching Source** field on GORCMUS for the user ID. If the user ID is allowed to use other matching source codes (based on the setting of the **Allow Other Matching Sources** checkbox on GORCMUS), then you can change the value on the **Matching Source** field on GOAMTCH.
5. Use a Next Block to populate the Data Entry block with all of the data for the incoming transcript record that is present in the temporary tables.
6. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the prospect's record is created.
7. The incoming person's transcript record can be a match, a potential match, or a new record:
  - 7.1. If the incoming transcript is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - 7.2. If the incoming transcript is found to be a possible match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - 7.3. If the transcript is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.
8. If the person is found to be an exact match, you can do one of three things:
  - 8.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 8.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.

- 8.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
9. After selecting one of the options above, the user will be returned to SHAEDIS where they can continue processing the record. The asterisk (\*) that had appeared in the unlabeled field to the left of the **Last Name** field to indicate the person had not been verified will no longer be displayed.

## Maintaining Multiple Telephone Numbers

Since a person may have more than one telephone number associated with an address, multiple types of phone numbers may be maintained on the General Person Telephone Form (SPATELE). This form may be accessed directly from any form where a phone type and number are entered or maintained, such as the General Person Identification Form (SPAIDEN). Only one phone number associated with an address type and address sequence number may be flagged as primary, and it is this primary phone number which will be displayed with the address on various forms in Banner Student. If no primary number exists, then no phone number is displayed with an address. Phone numbers may also be inactivated via the **Inactivate (Indicator)**.

To associate a phone number with an address, you must enter an address type and sequence number. The Address Summary Form (SOADDRQ) may be queried to view all of the addresses which exist for a person.

When an address is inactivated, all phone numbers associated with that address type and sequence number are also inactivated. Inactivating phone numbers will uncheck the **Primary (Indicator)**, if present. Phone numbers can be reactivated on an individual basis and are automatically reactivated if the associated address is reactivated.

A telephone type can be associated with an address type. For example, address types of BI, BU, MA, and PA exist on the Address Type Code Validation Form (STVATYP). Phone types of BI, BU, MA, and PA could then exist on the Telephone Type Validation Form (STVTELE), and STVATYP would then contain with these phone types. The following shows how the Address Type Code and Telephone Type Validation Forms could be organized.

### STVATYP

Address Type	Description	Telephone Type	Description
BI	Billing	BI	Billing
BU	Business	BU	Business
MA	Mailing	MA	Mailing
PA	Parents	PA	Parents

## **STVTELE**

<b>Telephone Type</b>	<b>Description</b>
BI	Billing
BU	Business
MA	Mailing
PA	Parents

## Enter Biographic Information

After a person is established on the database, the General Person Form (SPAPERS) is used to enter biographic information about a person. It captures information such as birth date, sex, and marital status.

## Maintain Comments

After a person is established on the database, any comments relating to the person are entered using the Person Comment Form (SPACMNT).

## Enter Emergency Contacts

Emergency contact information including name, address, phone number, and relationship can be entered on the Emergency Contact Information Form (SPAEMRG) after a person has been added to the database.

## Enter Medical Information

The Medical Information Form (GOAMEDI) is used to capture medical data necessary to accommodate any special needs a person may require or disabilities a person may have that affect their enrollment at the institution.

## Maintain International Information

The International Information Form (GOAINTL) is used to add and update international and visa information, including nation of citizenship and I-20 information.

## Add/Remove Holds

The Hold Information Form (SOAHOLD) is used to assign, track, and remove holds for a person on the system. Holds may prevent registration, graduation, or the production of enrollment verification documents, transcripts and grade mailers. If a person has a hold, a message is displayed in the appropriate area.

## Schedule Appointments/Track Contacts

The Person Appointments/Contacts Form (SOAAPPT) is used to schedule appointments for a person and to track any contact with the person.

## Support Services Processing

After a person has been established on the database, they may begin to have information associated with their goals and needs requirements, as well as any services which are provided to them and are maintained. Examples of goals may be a two year degree, a word processing certificate, or a reading certificate. Examples of needs may be academic assistance or child care. Examples of services may be counseling, day care, and tutoring. The Support Services information may be maintained for any person existing on the system. The person does not need to be a student.

Goals, needs, and services may be maintained separately or may be grouped together to create a service group. A *service group* is a combination of goals, needs, and services which may be assigned together. A person may also be associated with a service group or with multiple service groups. These service groups consist of a specified set of goals, needs, and services. The service groups may then be assigned to persons existing on the database either online or via population selection and a batch load process.

An example of a service group may be an Adult Literacy Program where all of the participants have the same goal, a reading certificate; the same needs, remedial reading and academic monitoring; and the same services are provided, tutoring, counseling, and skills assessment.

This service group example would be defined on the Service Group Rules Form (SEASSGP). Individuals in the Adult Literacy Program could then be assigned to the service group via the Service Group Assignment Form (SEAASGN). Service groups may also be assigned in batch using a user-defined population selection and the Support Services Load Process (SERLOAD). The detail information about each individual's progress can be reviewed or modified on the Support Services Detail Form (SEADTL) for those persons who may have additional goals, needs, and services. The Support Services Query Form (SEAQNS) may be used to see which people have any combination of goals, needs, and services.

The Support Services Load Process (SERLOAD) may be used to create the data for the Service Group Assignment Form (SEAASGN) and the Support Service Detail Form (SEADTL).

Once a goal, need, or service has been assigned to a person, they may be further enhanced by creating information in the form of attributes or comments about the goal, need, or service. These attributes or comments specific to a goal for a person may be defined using the Goal Attributes and Comment Form (SEAGDTL). Attributes and comments specific to a need for a person may be maintained on the Need Attributes and Comment Form

(SEANDTL). Attributes and comments specific to a service for a person may be maintained on the Service Attributes and Comment Form (SEASDTL).

Three methods may be used to add support service data for an individual. They are as follows:

1. When large volume processing is required, create a set of individuals via population selection, then run the Support Services Load Process (SERLOAD) which assigns that set of goals, needs, and services associated with the service group.
2. When working with individuals, use the Service Group Assignment Form (SEASSGP) to create goals, needs and services based on service groups, then go to the Support Service Detail Form (SEADETL) to view and modify the details.
3. Go directly to the Support Service Detail Form (SEADETL) to enter any combination of goals, needs, and services. These may be associated with a service group or may be independent of a service group.

Service groups are optional. A person may be associated with a single service such as Study Skills Service or Matriculation Service without having a service group. Goals, needs, and services are all independent of each other. A person may have a goal without a need, or have a need without a goal, or have a service without a need or a goal. The successful completion of goals and needs met, and the provision of services can be tracked.

## Produce List of Persons

The Person Directory (SPRPDIR) provides a list of persons, addresses, and phone numbers in the system by type of person: recruit, applicant, student, and faculty.

## Purge Process

The following purge process may be used to purge information in the General Person Module.

### `gppaddr.pc` - Address Purge

This process will purge address information for a person. The user may choose either of two options:

1. Address expiration date (date must exist to be purged)
2. Inactive address (regardless of date)

Please see the *Banner General User Guide* for further information.

# Banner Student Interface to Banner Human Resources

Please refer to the *Interfaces* chapter for information on the interface between General Person data and Banner Human Resources.

## General Person Reports

---

This section contains a sample of each report in the General Person module. Parameter definitions are also provided for your convenience.

The following reports and processes are run through the General Person module:

Person Directory	(SPRPDIR)
Support Services Load Process	(SERLOAD)

## Creating a Population Selection

To perform population selection, the application you will be working with must first be defined on the Application Definition Rules Form (GLRAPPL).

The second step is to enter the Population Selection Definition Rules Form (GLRSLCT), enter the **Application (Code)**, and create a **Selection ID (Identifier)** with a description.

In the Selection Definition section, define the **Select** and **From** portions of the SQL statement that the selection represents.

**Example:**

```
Select:      SARADAP_PIDM
From:        SARADAP
```

Next, enter the Selection Rules for the population of records you would like to see.

**Example:**

```
SARADAP_TERM_CODE_ENTRY    =    '200010'        AND
SARADAP_LEVL_CODE          =    'UG'
```

Save your data and exit. Your population selection rules will be compiled. If any errors are issued during the compilation process, resolve the errors before continuing. If you do not resolve all errors given during the compile process, you will not be able to use the population selection rules to extract a population.

You are now ready to extract the population of people. The Population Selection Extract (GLBDATA) is run from the Process Submission Control Form (GJAPCTL). At minimum, you will need to supply the parameters for Selection Identifier 1, Application, and Creator ID, which are the values that were in the Key Information of the Population Selection Definition Rules Form (GLRSLCT).

After extracting the population, you can use the Population Selection Extract Data Form (GLAEXTR) to view and/or modify the people in the population. You can add or delete people from the population using this form. The keys to the form are **Application**, **Selection ID**, and **Creator ID**. (**User ID** is also displayed in the Key Information.) You will be able to add or delete people only from populations that you selected.

After extracting the population, and modifying the people in it if necessary, you can use the population for a variety of purposes. Letters can be produced using Letter Generation, based upon a population, and many Banner reports and processes also can accept a population for processing.

For additional details on population selection, refer to the *Banner General User Guide*.

## Person Directory (SPRPDIR)

**Description** This report is used to produce a list of persons, addresses, and primary phone numbers in the system by type of person. You can run this report for recruits, applicants, students, and/or faculty members. If you choose faculty members you can specify instructors, advisors, both, or all faculty members. You can also create a population selection.

Parameters	Name	Required?	Description	Values
	Term	Yes	Enter the term code representing the term for which the list is to be printed.	Term Code Validation Form (STVTERM)
	Person Type List	Yes	Enter <i>R</i> to run the list of recruits, <i>A</i> to run the list of applicants, <i>S</i> to run the list of students, and enter <i>F</i> to run the list of faculty members. Multiple values are permitted.	R Recruits A Applicants S Students F Faculty
	Confidential Person Print Ind	Yes	Enter <i>N</i> to restrict printing of confidential persons; enter <i>Y</i> to print confidential person's information.	Y Print confidential information N Do not print confidential information
	Address Selection Date	No	Which address, effective on this date, do you want to print on the report. Leave blank for today; enter in date format DD-MON-YYYY.	
	Address Type	Yes	Enter the address type to be printed on the report; multiple requests are permitted and must be entered in priority sequence.  For example, <i>IMA 2PR</i> will first print the mailing address, and if none is found, will print the permanent address.  Enter each parameter then hit return for the next prompt. Returning with a null value will move you on to the next parameter.	Address Type Code Validation Form (STVATYP)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Print ID	No	Enter <i>Y</i> to print the IDs for the persons on the list. Enter <i>N</i> if you don't want the IDs printed.	Y Print IDs N Do not print IDs
	Faculty Type	No	Enter <i>A</i> to print the faculty members who are advisors; enter <i>I</i> to print the faculty members who are instructors; enter <i>B</i> to print faculty members who are advisors and instructors; leave null to print all faculty members regardless of type.	A Faculty Advisors I Faculty Instructors B Both
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered. ## Support Services Load Process (SERLOAD)

**Description** This process is used to automatically create needs, goals, and services for a group of people based on a user-defined service group. This process accepts an input file from the Population Selection process to create the support services information. Refer to the *Banner General User Guide* to review the method used to create a population selection.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	Report Term	Yes	Enter the code representing the term for which the report is to be run.	Term Code Validation Form (STVTERM)

Parameters	Name	Required?	Description	Values
	Effective Term	Yes	Enter the term code representing the effective term for which the support service detail is to be loaded. This term will also control which service group rules are to be used when creating the goals, needs, and services detail.	Term Code Validation Form (STVTERM)
	Service Group Code	Yes	Enter the service group for which the population is being loaded. All persons in the file will be loaded with this service group code. Multiple service group codes may be entered.	Service Group Validation Form (STVSSGP)

# 7 Faculty Load

## Faculty Load Procedures

### Faculty Workload Rules Creation

The Faculty Load Term Control Form (SIATERM) must be established for each term for which faculty assignments are created. The FTE (full time equivalency) factor is used as the denominator to calculate the term FTE. For example, the faculty members workload for the term is 12.00. To reach the full time equivalent the FTE factor of 15 is specified on SIATERM, hence the faculty members term FTE is:

$$\frac{\text{Workload}}{\text{Term FTE factor}} = \text{Term FTE}$$
$$\frac{12}{15} = .80$$

The Faculty Workload Contract FTE Form (SIACFTE) must then be used to establish the contract FTE factor. The keys to this form are **Contract (Type Code)** and **(Effective) Term**. The contract FTE factor may be maintained and will be used when performing contract term analysis (contract term FTE) or contract analysis (contract FTE) on the Faculty Contract Analysis Form (SIACONA).

All assignments with a like contract type are grouped together, and a contract term FTE and contract FTE are calculated as follows:

A contract term FTE is calculated as:

$$\frac{\text{Term Workload for the Contract}}{\text{Contract FTE factor}} = \text{Contract Term FTE}$$

A contract FTE is calculated as:

$$\frac{\text{Sum of all Term Workload associated with the Contract}}{\text{Contract FTE factor}} = \text{Contract FTE}$$

The Faculty Contract Rules Form (SIAFCTR) is used to specify the terms included in a contract type for an effective term. Contract types are established on the Faculty Contract

Type Code Validation Form (STVFCNT). For example, a Fall/Spring contract effective in 199901, Fall of 1999 can include the terms:

199901	Fall 1999
199902	Spring 2000

A Summer One/Summer Two contract effective in 199203 will include the terms:

199903	Summer One 2000
199904	Summer Two 2000

 **Note**

Contract types may be defined for either semester or quarter term structures. These rules must be created prior to performing contract analysis either online or in batch. ■

The Faculty Workload Term Rules Form (SIAFLRT) is used to create the workload rules to be used when performing term analysis. Workload rules may be inactivated by unchecking the **Active (Workload Status)** checkbox. Multiple rules may be created for a workload rule code. When multiples exist all term rules will be used in the analysis. Each workload rule can specify credit hour ranges, contact hour ranges, workload ranges, and a FTE range. For example, a workload rule code for a full time professor in the college of Arts and Science is created as follows:

Workload Rule Code: FTTPR01 Full Time College 01

Credit Hour Range		Contact Hour Range		Workload Range	
Total:	12 to 15	Weekly:	Inst:	12.00	
Generated:		Total:	Non-Inst:	3.00	5.00
			Total:	15.00	18.00
			FTE Range:	.80	1.00

This rule specifies that the instructor should be teaching between 12 to 15 credit hours per term with 12 instructional workload units, 3 to 5 non-instructional workload units for a total workload of between 15 to 18. His overall FTE should also be in the 0.8 to 1.0 range.

Term rules may be rolled forward to a future term via the **Default Term** field in the Key Information of the Faculty Workload Term Rules Form (SIAFLRT).

The Faculty Contract Term Rules Form (SIAFLCT) is used to create the rules which are to be used when performing a contract analysis on a term-by-term basis.

The Faculty Workload Contract Rules Form (SIAFLRC) is used to create the workload rules to be used when performing the contract analysis. This form works in the same fashion as the Faculty Workload Term Rules Form (SIAFLRT) except that these rules are effective term oriented.

In summary, there are three methods of faculty load analysis:

**1. Faculty Workload Analysis**

Performed on the Faculty Assignment Form (SIAASGN) using the rules established on the Faculty Workload Term Rules Form (SIAFLRT).

**2. Faculty Contract Term Analysis**

Performed on the Faculty Contract Analysis Form (SIACONA) using the rules created on the Faculty Contract Term Rules Form (SIAFLRT), the Faculty Workload Contract FTE Form (SIACFTR), and the Faculty Load Term Control Form (SIATERM).

**3. Faculty Contract Analysis**

Performed on the Faculty Contract Analysis Form (SIACONA) using the rules created on the Faculty Workload Contract Rules Form (SIAFLRC) and the Faculty Workload Contract FTE Form (SIACFTE).

The batch Faculty Load Contract Analysis Report (SIRCTAL) handles multiple faculty contract types and performs contract term analysis.

## Faculty Information

The Faculty Load Module contains three different forms for maintaining faculty information. They are:

1. The *Faculty Personnel Form* (SIAFPER) is used to maintain the tenure and sabbatical information, as well as AAUP membership and years of teaching experience. This form contains no required data elements and is not essential to processing.

 **Note**

The information entered on this form is shared with the Banner® Human Resources System. If your institution has the Banner Human Resources System, then information is maintained on the Faculty Action Tracking Form (PEAFAC) in that system. ■

 **Note**

The Tenure Code Rule Form (PTRTENR) must be established prior to entering or maintaining any tenure information on a faculty member. This is a Banner Human Resources System form which will be delivered with the Banner Student System for those institutions which do not have the Banner Human Resources System. This form is documented in the “Validation Forms” chapter of the *Banner Student User Guide*. ■

2. The *Faculty/Advisor Information Form* (SIAINST) must be created for faculty members prior to them being available to teach a section or be assigned as an advisor. This form is effective term oriented to maintain the information as it changes over time.

The Faculty Data information maintains the faculty status information (inactive faculty members may not be assigned to sections), which indicates whether the persons are faculty members or advisors as well as their category and staff time. The **Workload Rule (Code)** maintained on this form is important in the term analysis process. This code will determine the set of rules to be used to analyze the faculty members term assignments.

The Faculty Contract information allows for an instructor or advisor to be associated with multiple contracts and contract rules. One contract should be designated as the default contract via the **Default Indicator**. The user-specified default contract will be automatically placed on assignments when the instructor is assigned to the CRN on the Faculty Assignment Form (SIAASGN) or the Schedule Form (SSASECT). If no contract type is specified, then no contract analysis may be performed.

The Faculty College and Department information is used to specify the faculty member's home administrative college and department. It may also be used to specify the percentage breakdown if the faculty member is assigned to multiple departments and/or colleges.

The Faculty Attributes information may be used to specify certain criteria about faculty members, such as whether they have been certified to teach specific courses.

The Faculty Comments information may be used to record any additional information about the faculty members.

3. The *Faculty Degree Information Form* (SIAFDEG) is used to maintain the degree information associated with the faculty member. This form is not essential to processing. Multiple degrees may be associated with a single prior college and each degree may have major, minor, and concentration information associated with it. The dates the transcript was received and reviewed are also available on this form.

 **Note**

Information entered on the Prior College Form (SOAPCOL) or on the General Information Form (PPAGENL) in the Banner Human Resources System will be displayed on this form. ■

## Faculty Assignments

Prior to assigning faculty members to classes, you should establish the instructional workload. This process is done via the Basic Course Information Form (SCACRSE). The Schedule Type information on SCACRSE allows the instructional workload to be assigned for each schedule type. For example, the schedule type of lecture for BIOL 101 may have a workload value of 3.00, the lab for BIOL 101 may have a workload value of 1.00.

Adjusted workload may also be established in the Schedule Type information. Adjusted workload is based on over-enrollment of a section. For example, if more than 32 students enroll for the lecture section of BIOL 101, then the instructor receives a workload of 3.25 instead of 3.00. This adjustment will occur automatically based on the section enrollment.

If workloads are not maintained at the catalog, then they may be entered when each instructional assignment is entered.

Instructional assignments may be entered on either the Schedule Form (SSASECT) or the Faculty Assignment Form (SIAASGN). Assignments entered on the Schedule Form are made in the Instructor information.

Faculty members may be assigned to sessions of a section or to the overall section. Here are examples of how assignments can be made:

- One faculty member to one section which has multiple sessions
- One faculty member to one session
- Multiple faculty members to one section with multiple sessions
- Multiple faculty members to one session

When assigning instructors on the Schedule Form (SSASECT), the only fields which may be modified are the **Percent Responsibility** and the **Percent of Session**. Updates to the instruction workload must be performed on the Faculty Assignment Form (SIAASGN).

If an instructor's assignment conflicts with another assignment for the term, a message is generated, and the conflict override must be entered to permit the time conflict in assignments.

Inactive instructors may not be assigned to instructional or non-instructional assignments. If an instructor has been inactivated on the Faculty/Advisor Information Form (SIAINST), then the message *Instructor is not active for this term* is displayed when the instructor ID is entered in the Key Information of SIAASGN.

The user will not be able to change the instructor's status to "inactive" on the Faculty/Advisor Information Form (SIAINST), if assignments exist for the term being updated.

The Available Faculty Query Form (SIAFAVL), which may be used to find a faculty member with the right attributes to teach the section, is accessed from the Instructor window on the Schedule Form (SSASECT) using a Help function. The Faculty Schedule Query Form (SIAASGQ) which may be used to view the faculty member's schedule for the term comes from the same window, using a Count Query Hits function. This is a query only form. Assignments entered on SSASECT will be displayed on the Faculty Assignment Form (SIAASGN). The Faculty Course Query Form (SIQSECM), used to display course section information associated with an instructor's existing schedule, is query only and is accessed from SIAASGN.

The instructional and non-instructional assignments are entered and maintained on the Faculty Assignment Form (SIAASGN). Instructional assignments entered here can have the instructional workload adjusted. For example, if a full Professor has been required to teach a remedial English course but will be given additional workload credit for doing so, then the **Override Workload** field would be used. All instructional and non-instructional

assignments may be associated with a contract so that contract analysis may include only the appropriate assignments for the contract.

The following are the definitions of some of the calculations performed in the Faculty Load module. The legend below explains the examples for the calculations.

<b>Letter</b>	<b>Definition</b>
A	Total meeting period days for the term
B	Excluded meeting days from Schedule Exclusion Rules Form (SSAEXCL)
C	Number of minutes in a meeting period
D	Duration factor from Faculty Load Term Control Form (SIATERM)
E	% RES
F	% SES

*Calculated Workload*—This is calculated as follows:

$$\begin{aligned} & \text{Workload or Adjusted Workload} * \% \text{ of Responsibility} \\ & 3.00 * 50\% = 1.5 \text{ Calculated Workload} \end{aligned}$$

*Instructor Credit*—This is calculated as follows:

$$\begin{aligned} & \text{Session Credits} * \% \text{ of Responsibility} \\ & 4.00 * 50\% = 2.0 \text{ Instructor Credits} \end{aligned}$$

*Weekly Contact Hours*—This is the weekly contact hours associated with the session. This calculation uses the duration factor and percentage of session assigned to the faculty member. The following is an example of weekly contact hours:

#### **Hours Per Meeting Per Week**

$$\frac{A - B * C}{D}$$

$$\begin{aligned} & \text{Hours Per Meeting Per Week} * \% \text{ Responsibility} * \% \text{ of Session} \\ & 3 * 50\% * 100 = 1.5 \text{ Weekly Contact Hours} \end{aligned}$$

*Total Contact Hours*—This is the total contact hours for the session for the term. This calculation uses the percentage of responsibility and percentage of session.

### Total Contact Hours

$$\frac{A - B * C}{D * F * E}$$

$$\text{Total Contact Hours} = \frac{(\# \text{ of Meetings} * \text{Hours Per Meeting}) * \%}{\text{Responsibility} * \% \text{ Session}}$$

The total contact hour calculation on the Faculty Assignment Form (SIAASGN) uses the override value, should one exist, for contact hours per week from the Schedule Form (SSASECT).

If a section has multiple day and time combinations, the total contact hours are calculated by determining the contact hours for each combination, and then calculating the sum of these values, which will be the total contact hours.

#### **Meeting Combination 1:**

$$\text{Contact Hours for Meeting 1} = \frac{\text{Hours/Week from SSASECT}}{\text{Number of Meeting Days/Week}} \times \text{Total Meeting Days}$$

#### **Meeting Combination 2:**

$$\text{Contact Hours for Meeting 2} = \frac{\text{Hours/Week from SSASECT}}{\text{Number of Meeting Days/Week}} \times \text{Total Meeting Days}$$

#### **Total Contact Hours:**

$$= \text{Contact Hours for Meeting Combination 1} + \text{Contact Hours for Meeting Combination 2}$$

An example is as follows:

For 199901, Anthropology 101, CRN 10030, meets with the following day and time combinations:

#### **Meeting 1:**

29-AUG-1999 to 13-DEC-1999      M, W, F      8:00 - 8:50      3 hours/week

#### **Meeting 2:**

29-AUG-1999 to 13-DEC-1999      R      12:00 - 1:50      2 hours/week

 **Note**

In this example, the hours/week values are overridden, but this calculation will work the same should you leave the default values in place. ■

**Meeting 1:**

$$\begin{aligned} &= \frac{\text{Hours/week from SSASECT}}{\text{Number of Meetings/Week}} = 3 \quad \times \quad \text{Total Meeting Days} = 46 \\ &= 3 \\ &= 1 \times 46 \\ &= 46 \end{aligned}$$

**Meeting 2:**

$$\begin{aligned} &= \frac{\text{Hours/week from SSASECT}}{\text{Number of Meetings/Week}} = 2 \quad \times \quad \text{Total Meeting Days} = 16 \\ &= 1 \\ &= 2 \times 16 \\ &= 32 \end{aligned}$$

**Total Contact Hours = 78.00**

*Generated Credit Hours (GCH)*—This calculation uses the percentage of responsibility and session credit hour value.

$$\text{GCH} = \# \text{ Credits Per Session} * \% \text{ Responsibility} * \# \text{ students in section}$$

*Assignment FTE*—A full time equivalent will be calculated for each assignment. This value is calculated using the adjusted instructional workload and the term FTE factor from the Faculty Load Term Control Form (SIATERM). The following example uses a Term FTE factor of 15.

$$\frac{3}{15} = .20 \text{ FTE}$$

The non-instructional assignments are maintained in the Faculty Non-Instructional Assignment information on SIAASGN. The workload may be entered here or it can default from the information on the Faculty Non-Instructional Type Code Validation Form (STVNIST). Non-Instructional assignments may also be associated with a college, department and a TOPS code (Taxonomy of Programs and Services). An assignment FTE similar to the one calculated for instructional assignments is also included for each non-instructional assignment.

A position number may be entered for further integration with the Banner Human Resources System.

The Faculty Workload Summary window on the Faculty Assignment Form contains the Faculty Workload Summary information and the Faculty Workload Rules and Analysis

information. The Summary information displays the summary results for the term including credit hours, generated credit hours, weekly contact hours, term contact hours, instructional workload, non-instructional workload, total workload, and term FTE.

A Next Block function from the Summary information performs the term analysis for the faculty member. If no workload rules rule code has been established or no workload rules are created, then no analysis can be performed. The term analysis will display the rule associated with the workload rule code and indicate whether the faculty member is in an underload or overload situation. A *U* is displayed next to the workload rule code value for underloads, an *O* is displayed for overloads.

For example, a faculty member with workload rule code 000001 should teach between 12 and 15 credits. The faculty member is only assigned to 10 for the term so the form would display as follows:

	Low	High
Credit Hours	12.00	15.00U

A message is displayed on the bottom of the form to indicate that the workload rules have *not* been satisfied by the instructor.

## Faculty Contract Analysis

The Faculty Contract Analysis Form (SIACONA) is used to perform the contract analysis for the faculty member on a term basis and on an overall contract basis. This process works in the same fashion as the term analysis which is performed on the Faculty Assignment Form (SIAASGN). Contract analysis will summarize the terms associated with the contract in the first section on the form. For example, if Fall and Spring are both included in the contract, then the instructional workload for both Fall and Spring will be summarized into one total. The Contract Term Analysis information will perform the analysis and display an overload or underload indicator for those rules which are not satisfied by the instructor's assignments. Only those assignments associated with a contract will be used in the contract analysis.

## Multiple Contracts

An instructor may be assigned to multiple contracts via the Faculty Contract information on the Faculty/Advisor Information Form (SIAINST). This allows for an instructor to be associated with an unlimited number of contracts within the effective terms specified. An example where this may be useful is for a full-time professor who also has a secondary contract to teach an evening course in the Continuing Education Division, which should not impact his full-time contract. Each assignment, either instructional or non-instructional, can now be associated with a specific contract code.

The **Default Indicator** must be specified when creating contract information. This default contract code will be used when assignments are created on either the Schedule Form (SSASECT) or on the Faculty Assignment Form (SIAASGN).

Faculty load analysis examines only the assignments associated with a contract when performing contract analysis.

Two methods of contract analysis exist, contract term analysis and contract analysis. Contract term analysis is supported using the Faculty Contract Term Rules Form (SIAFLCT). This rules form allows for rules to be established by term and contract type. There are two sections on the Faculty Contract Analysis Form (SIACONA), Contract Term Workload and Contract Term Analysis, which display the contract term and workload rules, and perform the contract term analysis.

An example where contract term analysis might be used is when a faculty member's contract spans two terms, and the Dean needs analysis on the instructor's workload for a single term within the contract.

## Automatic PIN Creation

PINS can be added to Banner manually for an individual, by batch process using a population selection, or automatically by database trigger.

You have the option to automatically create PINs when a general student record or faculty record is inserted. Triggers on the SGBSTDN and SIBINST tables will create PINs when a student or faculty record is inserted into either table, if the triggers are set up to do so. This automatic creation allows the PIN to be available for use as soon as the person becomes eligible to access the self-service processing. The triggers will fire when the record is inserted, based upon the institution's PIN preferences and table selections on the PIN Preference Form (GUAPPRF).

Please note that performance issues may arise when the PIN triggers are used. You may need to turn this functionality off if batch processing is involved. Student and faculty records are generally processed individually and should not be affected. However, if you assign decisions which create student records using the Admit Decision Calc Report (SARBDSN), you may want to disable automatic PIN creation during batch decision runs.

Please refer to the *Banner General User Guide* for more information on PIN functionality and the PIN Preference Form (GUAPPRF).

# Automated Faculty Load and Compensation Processing

This processing automatically calculates faculty load payroll compensation in Banner Human Resources, based on faculty course load data from Banner Student. The matching faculty assignment is then automatically created in Banner Human Resources in the Faculty Load and Compensation module.

Please refer to the *Banner Human Resources User Guide* for more information.

## Overview

Forms and reports in Banner Human Resources allow a faculty member's assigned workload (course assignments and non-instructional assignments in Banner Student) to be used to automatically generate a compensation/job assignment record in Banner Human Resources.

- The Faculty/Advisor Information Form (SIAINST) and the Faculty Assignment Form (SIAASGN) provide the necessary data. SIAASGN uses the position and suffix numbers for the faculty assignment.
- The Faculty Non-Instructional Type Validation Form (STVNIST) is used to maintain faculty non-instructional type codes.
- The Course Labor Distribution Form (SCACLBD) and the Schedule Labor Distribution Form (SSACLBD) are used to maintain labor distribution data for adjunct faculty assignments.

You can calculate faculty compensation based on institution-specific rules. The calculation results populate the employee's job record, and payment is made during the payroll process. Banner Human Resources provides the rules and security controls needed to compile the core compensation records. Data is also used in the Faculty Compensation area of Employee Self-Service.

### Note

The Banner Human Resources Faculty Load and Compensation module does not affect the Banner Student Faculty Load module and is not dependent on the Banner Student faculty workload rules. ■

## Building Job Labor Distribution Data for Courses

The Course Labor Distribution Form (SCACLBD) is used to build and maintain job labor distribution data at the course catalog level for adjunct faculty assignments. This information can be used for scheduling as well on the Schedule Labor Distribution Form (SSACLBD). (Labor distribution data is entered in Banner Human Resources.) The use of labor distribution information is optional. If this information is not entered on SCACLBD, the FOAPAL (fund, organization, account, program, activity, location) distribution for the associated position is used. The data on SCACLBD is used to override the budget factors

associated with the funding of a specific position in Banner Human Resources that has been assigned to the employee on SIAASGN.

The form displays one of two windows, one if Banner Finance is installed and the other if Banner Finance is not installed. When Banner Finance is installed, FOAPAL data is validated by part-of-term or the effective term end date on STVTERM if no part-of-term exists. This ensures that the FOAPAL elements are valid until that date. If Banner Finance is not installed, the **External Account Code** field must be entered, and no validation takes place. You can use the **Maintenance** button to copy and end the labor distribution information by term.

 **Note**

Banner Finance requires a timestamp. A midnight timestamp will be associated with the end date when the date is submitted for validation. ■

You can use the Options Menu to access SIAASGN and view faculty assignments, to access SSASECT and view term section details, and to access SSACLBD and view schedule labor distribution information.

## Building Job Labor Distribution Data for Sections

The Schedule Labor Distribution Form (SSACLBD) is used to build and maintain job labor distribution data at the section level (CRN) for adjunct faculty assignments. (Labor distribution data is entered in Banner Human Resources.) The use of labor distribution information is optional. If this information is not entered on SSACLBD, the FOAPAL (fund, organization, account, program, activity, location) distribution for the associated position is used. The data on SSACLBD is used to override the budget factors associated with the funding of a specific position in Banner Human Resources that has been assigned to the employee on SIAASGN.

 **Note**

The class section must first have been created using the Schedule Form (SSASECT), before using the Schedule Labor Distribution Form (SSACLBD). ■

Schedule labor distribution data defaults into the Class Schedule module (SSACLBD) based on the course labor distribution information defined in the Course Catalog module (SCACLBD). The defaulted information can be overridden to create section specific labor distribution records. Overrides take place when FOAPAL information exists on SSACLBD, and the **Use Schedule Labor Distributions** checkbox is checked on the Faculty Load Contract Type Control Rules Form (PTRFLCT) in Banner Human Resources. When this checkbox is checked to use overrides with course-based faculty, a unit method is used to determine the appropriate FOAPAL distribution. However, unit method processing is *not* advised for job labor distribution overrides. FOAPAL overrides do not apply to non-instructional assignments.

Processing takes place as follows:

- If the FOAPAL exists on SSACLBD for the CRN, and the **Use Schedule Labor Distributions** checkbox is checked (*Y*), the Faculty Load Extract Process (PEPFLAC) will use the FOAPAL for the CRN, and it will be defaulted to the job.
- If the FOAPAL exists on SSACLBD for the CRN, but the **Use Schedule Labor Distributions** checkbox is unchecked (*N*), the Faculty Load Extract Process (PEPFLAC) will use the FOAPAL for the position, and it will be defaulted to the job.
- If the FOAPAL does not exist on SSACLBD for the CRN, but the **Use Schedule Labor Distributions** checkbox is checked (*Y*), the Faculty Load Extract Process (PEPFLAC) will use the FOAPAL for the position, and it will be defaulted to the job.
- If Banner Finance is not installed, the positions are funded through external account codes.

The form displays one of two windows, one if Banner Finance is installed and the other if Banner Finance is not installed. When Banner Finance is installed, FOAPAL data is validated by part-of-term or the effective term end date on STVTERM if no part-of-term exists. This ensures that the FOAPAL elements are valid until that date. If Banner Finance is not installed, the **External Account Code** field must be entered, and no validation takes place.

 **Note**

Banner Finance requires a timestamp. A midnight timestamp will be associated with the end date when the date is submitted for validation. ■

You can use the Options Menu to access SIAASGN and view faculty assignments, to access SSASECT and view term section details, and to access SSACLBD and view course labor distribution information.

## Tracking Compensation for Faculty Assignment Records

Instructional and non-instructional data elements on the Faculty Assignment Form (SIAASGN) are used with the Banner Human Resources processing to build the faculty assignment record and track compensation based on term start and end dates.

 **Note**

Faculty members are created on the Faculty Advisor Information Form (SIAINST) and must have the **Status** set to *Active* and the **Faculty (Indicator)** checked to be associated with assignments on SIAASGN. ■

The instructional elements used by the automated faculty load and compensation processing are: **CRN, Subject, Course, Section, Session Credit, Workload, Override Workload, Calculated Workload, Weekly Contact, Contract Type, Position Number, and Position Number Suffix.**

The non-instructional elements used are: **(Non-Instructional) Type, Workload, Weekly Contact, College, Department, Contract (Type), Position Number, and Position Suffix.**

The **Position Number** field is used to enter a position number for the faculty assignment. It is used to tie the faculty member's assignment to a position defined in the Banner Human Resources system. This is used when Position Control is installed.

- Use a List function to access the Position List Form (NBQPOSN) and view a list of all positions for the organization in position number order. You can query to narrow the results.
- Use a Count Query Hits function to access the Employee Job Inquiry Form (NBIJLST) and view all jobs that are in effect as of the query date in the Key Block. You can query to narrow the results.

When Position Control is not installed, the Count Query Hits and List functions are not available.

The **Position Number Suffix** field is used to display a position number suffix from Banner Human Resources. This is used when Position Control is installed.

 **Note**

Banner Student users will need access to the NBQPOSN and NBIJLST forms in Position Control to use the position number data. These forms do not invoke Banner Human Resources Security. You can evaluate who at your institution should be able to access these forms. ■

The **Compensation Extracted** checkbox is enabled when the assignment has been extracted into the Faculty Compensation module or has been applied to Banner Human Resources from that module. This field cannot be changed. This checkbox is dynamically set when Banner Human Resources is installed, where the faculty assignment exists in the PERFASG table (instructional assignment) and the PERFNIS table (non-instructional assignment).

The **Compensation Applied** checkbox is enabled when the assignment has been extracted into the Faculty Compensation module or has been applied to Banner Human Resources from that module. This field cannot be changed. This checkbox is dynamically set when Banner Human Resources is installed, where the position and suffix for the existing, active assignment have been applied to the NBRJOBS table and then mapped from SIRASGN and SIRNIST to PERFASG and PERFNIS.

 **Note**

When the **Compensation Extracted** checkbox is checked and the **Compensation Applied** checkbox is unchecked, you can continue to make adjustments to the faculty member's assignment and components. Records will need to be unlocked in the Faculty Compensation module before the changes will be apparent in Banner Employee Self-Service.

When the **Compensation Applied** checkbox is checked, you can continue to make changes in Banner Student. However, manual

adjustments must be made to the faculty member's job assignment in Banner Human Resources to ensure that compensation is correct. ■

SIAASGN checks if the job assignment exists (NBRJOBS), when Banner Human Resources is installed. It also checks if the position number is valid and active, when the job assignment does not exist in Banner Human Resources. This will allow the new job assignment to be created in Banner Human Resources. Prior invalid data in SIRASGN displays a message based on the setting of the **Position Validation on Faculty Assignments** checkbox on the Installation Rules Form (PTRINST). When the checkbox is checked (Y), an error is displayed. When the checkbox is unchecked (N), a warning message is displayed.

When a position number is entered for a course assignment and the record is saved, the following validation occurs:

1. The system checks that the position number exists in Position Control.
2. The system checks that the position has an active status.
3. If the position number does not exist, an error message is displayed.
4. If the position is not active, an error message is displayed.
5. If the position and suffix are selected, but the ID is for an employee, a warning message is displayed.

 **Note**

Use the **Position Validation on Faculty Assignments** checkbox on the Installation Rules Form (PTRINST) to allow validation of Position Control numbers to take place. This indicator must be checked (Y) before the validation can occur. If you wish to use the warning message for invalid position numbers, leave the indicator unchecked (N). ■

## Using Position Numbers with Faculty Compensation

Position numbering and suffix numbering assignments for instructional and non-instructional items are used in the final compensation record that is passed to Banner Human Resources. Compensation can be for full-time, salaried faculty members and for part-time, course-based faculty members. Here are some recommended uses of position numbers and suffixes.

### Full-Time Salaried Faculty

Typically, a full-time faculty member has one job assignment and is compensated for a number of assigned activities. Overload payments can occur when the faculty member is assigned more than a full load. In this situation, a separate position number is assigned in the Faculty Compensation module to designate the overload payment. If the same position number and suffix are used for the overload payment, the overload compensation is added

to the regular assignment pay under one position, potentially making identification of these payments difficult and also causing benefit costs to be incorrectly calculated against these additional dollars. It is recommended that one position number and one suffix be used for the regular contact, and a unique position number and suffix be used for the overload.

## Part-Time Course-Based Faculty

Conditions can exist for part-time faculty members that affect how position numbers and suffixes are assigned and paid. A faculty member may have some or all of the following payment conditions:

- a three week course,
- a course that runs for the entire length of the term,
- an online course that is associated with a two month time span,
- a non-instructional assignment that is to charged to another area, or
- a course that runs for a part-of-term.

If these payment conditions exist within Banner Student assignments for a faculty member, each of these assignments must be associated with a unique position number/suffix combination. This is because the Faculty Compensation module is creating job assignments and calculating when they should be paid. In the above list of conditions, each assignment is paid at a different time and has different start and end dates on the faculty member's job assignments.

If a faculty member's assignments are only operating for one condition, such as two courses running for the entire length of the term that are charged to the same department, the same position number/suffix combination can be used. This is because the payments are added together and are paid and charged for the entire length of the term.

### **Warning**

When the same position number and suffix combination is used for each faculty assignment in Banner Student, it can result in underpayment or overpayment in the Faculty Compensation module of Banner Human Resources. ■

## Rolling Distribution Information

The Roll Labor Distribution parameter in the Term Roll Report (SSRROLL) is used to roll the labor distribution FOAPAL information from SSACLBD/SSRCLBD for the section/CRN to the new term. This FOAPAL is validated using the end date of the part-of-term for the CRN. If no part-of-term exists, the FOAPAL is validated using the end date from STVTERM, to ensure that the FOAPAL elements are valid until that date.

Banner Finance requires a timestamp. A midnight timestamp will be associated with the end date when the date is submitted for validation. ■

If all elements are successfully rolled, the process will display the *Section Rolled* message in the output. If any element of the FOAPAL is invalid, an error message will be printed on the output file, and the entire FOAPAL string will not be rolled. Other details associated with the CRN, such as instructors, links, fees, attributes, and so on, will still be rolled. If an error is encountered on a class with split distributions, none of the FOAPAL records will be rolled, because this could cause an unbalanced labor distribution.

The following errors may be printed on the report output for invalid FOAPAL elements.

Message	Cause	Action
<i>*ERROR* Chart of Accounts is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Chart of Accounts Status Indicator</b> for this Chart of Accounts code is not active.	Enter an active Chart of Accounts code on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Chart of Accounts code is terminated. Schedule Job Labor Distribution not rolled.</i>	The Chart of Accounts is no longer in effect in Banner Finance.	Enter an active Chart of Accounts code that has not passed its termination date on the Chart of Accounts Code Maintenance Form (FTMCOAS).
<i>*ERROR* Account Index is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Account Index Status Indicator</b> for this account index code is not active.	Enter an active account index on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Account Index is terminated. Schedule Job Labor Distribution not rolled.</i>	This account index is no longer in effect in Banner Finance.	Enter an account index that has not passed its termination date on the Account Index Code Maintenance Form (FTMACCI).
<i>*ERROR* Fund is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Fund Status Indicator</b> for this fund code is not active.	Enter an active fund code on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Fund is terminated. Schedule Job Labor Distribution not rolled.</i>	This fund is no longer in effect in Banner Finance.	Enter a fund that has not passed its termination date on the Fund Code Maintenance Form (FTMFUND).
<i>*ERROR* Fund is not defined as data entry. Schedule Job Labor Distribution not rolled.</i>	This fund is not defined to be used for data entry in Banner Finance.	Enter a fund defined for data entry in Banner Finance.
<i>*ERROR* Organization is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Organization Status Indicator</b> for this organization code is not active.	Enter an active organization code on the Schedule Labor Distribution Form (SSACLBD).

Message	Cause	Action
<i>*ERROR* Organization is terminated. Schedule Job Labor Distribution not rolled.</i>	This organization is no longer in effect in Banner Finance.	Enter an organization that has not passed its termination date on the Organization Code Maintenance Form (FTMORGN).
<i>*ERROR* Organization is not defined as data entry. Schedule Job Labor Distribution not rolled.</i>	This organization is not defined to be used for data entry in Banner Finance.	Enter an organization defined for data entry in Banner Finance.
<i>*ERROR* Account is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Account Status Indicator</b> for this account code is not active.	Enter an active account code on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Account XXXXXX is not a labor account. Schedule Job Labor Distribution not rolled.</i>	The account type is not of a labor account and/or the <b>Internal Account Type Code</b> is not set to 60 in Banner Finance.	Enter an account type code with an <b>Internal Account Type Code</b> set to 60 in Banner Finance.
<i>*ERROR* Account is terminated. Schedule Job Labor Distribution not rolled.</i>	This account is no longer in effect in Banner Finance.	Enter an account that has not passed its termination date on the Account Code Maintenance Form (FTMACCT).
<i>*ERROR* Account is not defined as data entry. Schedule Job Labor Distribution not rolled.</i>	This account is not defined to be used for data entry in Banner Finance.	Enter an account defined for data entry in Banner Finance.
<i>*ERROR* Program is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Program Status Indicator</b> for this account code is not active.	Enter an active program code on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Program is terminated. Schedule Job Labor Distribution not rolled.</i>	This program is no longer in effect in Banner Finance.	Enter a program that has not passed its termination date on the Program Code Maintenance Form (FTMPROG).
<i>*ERROR* Program is not defined as data entry. Schedule Job Labor Distribution not rolled.</i>	This program is not defined to be used for data entry in Banner Finance.	Enter a program defined for data entry in Banner Finance.
<i>*ERROR* Activity is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Activity Status Indicator</b> for this activity code is not active.	Enter an active activity code on the Schedule Labor Distribution Form (SSACLBD).

Message	Cause	Action
<i>*ERROR* Activity is terminated. Schedule Job Labor Distribution not rolled.</i>	This activity is no longer in effect in Banner Finance.	Enter an activity that has not passed its termination date of the Activity Code Maintenance Form (FTMACTV).
<i>*ERROR* Location is inactive. Schedule Job Labor Distribution not rolled.</i>	The <b>Location Status Indicator</b> for this location code is not active.	Enter an active location code on the Schedule Labor Distribution Form (SSACLBD).
<i>*ERROR* Location is terminated. Schedule Job Labor Distribution not rolled.</i>	This location is no longer in effect in Banner Finance.	Enter a location that has not passed its termination date on the Location Code Maintenance Form (FTMLOCN).
<i>*ERROR* Invalid Project code. Schedule Job Labor Distribution not rolled.</i>	An invalid project code has been entered in Banner Finance.	Enter a valid project code for this Chart of Accounts in Banner Finance.
<i>*ERROR* Invalid Cost Type XX. Schedule Job Labor Distribution not rolled.</i>	An invalid cost type code has been entered in Banner Finance.	Enter a valid cost type code for this Chart of Accounts in Banner Finance.

## Faculty Security Menu and Term Availability

Faculty members and advisors can be restricted by date/term from accessing information through the Faculty and Advisor main menu in Self-Service. Date ranges can be set up to control access to the menu based on the term. Faculty members and advisors who are restricted from access to the main menu will see a message that access is not allowed.

The terms displayed to faculty members and advisors in the **Select a Term** pulldown list in Self-Service can also be restricted by date/term. Date ranges can be set up to control which terms are displayed in the list. Term information for a faculty member is compared to the active records on SIAINST. However, the **Status Date** field on SIAINST is not used in this processing.

### Set Up SOATERM

Use the Faculty and Advisor Access Dates section of the Part of Term and Web Registration Controls window on SOATERM to set up the date ranges in Self-Service for main menu access and term display in the pulldown list. The term date rules use start and end dates. When no faculty member or advisor access dates have been set up for a term, the current functionality will be used. Rules can be created on a term-by-term basis or for all terms on SOATERM.

Faculty members and advisors will have access to the Banner Faculty and Advisor Self-Service main menu when one of two conditions exists: when the current date does not fall within any date range for any term and the person has an active status for any term on the Faculty/Advisor Information Form (SIAINST), and/or when the current date does fall within a date range and the person has an active status for the term on SIAINST.

All terms are displayed in the Self-Service **Select a Term** pulldown list when no date ranges have been defined on SOATERM, the person is active on SIAINST for the term, and the Faculty and Advisor Controls have been set on SOATERM.

When a date range is set up, the Self-Service main menu for faculty members and advisors will only be displayed for terms where the current date falls within the defined date range. A term is displayed in the term selection list when no dates exist for a term, and the faculty member has an active status. A term will not be displayed when the current date does not fall into a date range set up for access or when the faculty member is inactive for the term.

Unique term records can exist, such as:

Term	Start	End	Menu	Term Selection
200443	01-JAN-2008	30-JUN-2008	Checked	Unchecked
200443	01-AUG-2008	31-AUG-2008	Unchecked	Checked

But date ranges cannot overlap within the term for the menu access or for the term selection list.

## Processing Examples

Here are some examples of how menu access and term selection can be set up on SOATERM. Faculty member FACMEMBER1 has SIAINST records for the terms shown below.

### **Example 1:**

SOATERM has dates for:

Term	SIAINST	Start	End	Menu	Term Selection
200443	Active	01-JAN-2008	30-JUN-2008	Checked	Checked
200620	Inactive	01-JAN-2009	30-JUN-2009	Checked	Checked

FACMEMBER1 logs into secure Self-Service on March 31, 2008.

- He has access to the menu, because he is active for term 200443, which is accessible on that date for term display.
- He sees term 200443 in the term selection list, because the current date falls within the range.

FACMEMBER1 logs into secure Self-Service on April 30, 2009.

- He does not have access to the menu, because April 30, 2009, falls within the date range for term 200620, and he is not active in term 200620.
- He does not see term 200443 in the term selection list, because the current date does not fall within the range for term display.

Terms that are defined as greater than 200443 but less than 200520 will be displayed in the term selection list, because no dates have been defined for those terms.

**Example 2:**

SOATERM has dates for:

Term	SIAINST	Start	End	Menu	Term Selection
200443	Active	01-JAN-2008	30-JUN-2008	Checked	Checked
200620	Inactive	01-JAN-2009	30-JUN-2009	Unchecked	Checked

FACMEMBER1 logs into secure Self-Service on March 31, 2008.

- He has access to the menu, because he is active for term 200443, which is accessible on that date.
- He sees term 200443 in the term selection list, because the current date falls within the range for term display.

FACMEMBER1 logs into secure Self-Service on April 30, 2009.

- He has access to the menu, because April 30, 2009, does not fall within any date range for which menu access is checked.
- He does not see term 200443 in the term selection list, because the current date does not fall within the date range for term 200443.

 **Note**

For a term, if a current date is not defined within any date range with the **Menu** checkbox checked, the faculty member will have access to the main menu, if he/she has an active SIAINST record. If the faculty member does not have an active SIAINST record, no menu access is allowed. ■

**Example 3:**

SOATERM has dates for:

Term	SIAINST	Start	End	Menu	Term Selection
200443	Active	01-JAN-2008	30-JUN-2008	Unchecked	Checked

FACMEMBER1 logs into secure Self-Service on March 31, 2008.

- He has access to the menu, because there are no dates defined for the current date.
- He sees term 200443 in the term selection list, because the current date falls within the range for term display.

FACMEMBER1 logs into secure Self-Service on April 30, 2009.

- He does not see term 200443 in the term selection list, because the current date does not fall within the range for term display.
- He has access to the menu, because there are no dates defined for the term.

**Example 4:**

SOATERM has no dates defined:

FACMEMBER1 logs into secure Self-Service.

- He has access to the menu, because there are no dates defined for the current date in any term.
- He has access to all active terms in the term selection list, because no restricted dates have been defined in any term.

**Example 5:**

SOATERM has dates for:

<b>Term</b>	<b>SIAINST</b>	<b>Start</b>	<b>End</b>	<b>Menu</b>	<b>Term Selection</b>
200443	Active	01-JAN-2008	30-JUN-2009	Checked	Checked
200620	Active	01-JAN-2009	30-JUN-2009	Checked	Checked

There is an overlap in the dates.

FACMEMBER1 logs into secure Self-Service on March 31, 2008.

- He has access to the menu, because he is active for term 200443, which is accessible on that date.
- He sees term 200443 in the term selection list, because the current date falls within the range for term display.

FACMEMBER1 logs into secure Self-Service on April 30, 2009.

- He has access to the menu, because April 30, 2009, falls within the date range for term 200443, and he is active in term 200443.

- He sees term 200443 and term 200620 in the term selection list, because the current date falls within the range for term display.

 **Note**

Faculty members who are inactive in term 200620 have access to the menu, because the current date falls with the menu date ranges for term 200443, when the faculty members were active. However, they do not see term 200620 in the term selection list. ■

## Faculty Security Scripts

Three scripts are used to create reports that assist with setup, testing, and troubleshooting. The scripts are not *run* from job submission. They are executed from the command line by developers or advanced functional users.

### srsormenu.sql: Menu Report

This script creates a report for a specific date range and displays faculty members and advisors who can access the main menu in Banner Faculty and Advisors Self-Service for that date range.

The script uses two parameters. Enter the start and end dates for the period for which you want to run the report.

- start\_date\_dd\_mon\_yyyy (in format DD-MON-YYYY)
- end\_date\_dd\_mon\_yyyy (in format DD-MON-YYYY)

For example:

```
Faculty and Advisor Security Dates - Menu Access(SORFTRM) Page 1
Enter value for start_date_dd_mon_yyyy: 19-AUG-2009
Enter value for end_date_dd_mon_yyyy: 31-AUG-2009
Start Date      End Date      Term
-----
19-AUG-09      20-AUG-09      099211
19-AUG-09      20-AUG-09      100001
21-AUG-09      22-AUG-09      No Menu Rule for Dates
23-AUG-09      29-AUG-09      200510
30-AUG-09      31-AUG-09      No Menu Rule for Dates
```

On August 19 and 20, 2009, only faculty members active in terms 099211 and 100001 will have access to the Faculty and Advisors menu in Banner Self-Service. (See lines 1 and 2 of the report.)

On August 21 and 22, 2009, any faculty members who are active in any term will have access to the Faculty and Advisors menu in Banner Self-Service, as no rules have been set up in SOATERM for these dates.

### srsorterm.sql: Term Selection Report

This script creates a report for a specific date range and provides a list of terms that will be displayed in the Banner Faculty and Advisors Self-Service term selection list for that date range. If a term is not included in the report, that term will not be available for selection in Self-Service for that date range.

The script uses two parameters. Enter the start and end dates for the period for which you want to run the report.

- start\_date\_dd\_mon\_yyyy (in format DD-MON-YYYY)
- end\_date\_dd\_mon\_yyyy (in format DD-MON-YYYY)

### srsorftrm.sql: Summary Report

This script creates a report of the records stored in SORFTRM. These records are ordered by start date.

The script uses one parameter.

menu\_or\_term (M for menu, T for term, B for Both)

Enter *M* to capture all menu records (SORFTRM\_MENU\_IND is *Y*). Enter *T* to capture term records (SORFTRM\_TERM\_IND is *Y*). Enter *B* to capture all SORFTRM records.

## Faculty Security Process Rules

This section discusses faculty member and advisor process rules used in Banner Faculty and Advisor Self-Service. Process rules are used to allow faculty member or advisor access to student information by process or role in Self-Service. The process codes used for the rules come from the Process Control Code Validation Form (STVPROC). The Faculty/Advisor Process Rules Form (SOAFACS) is used to set up the process rules for faculty members and advisors. The rules on STVPROC control access to the following processes:

- accessing student schedules (*DISPLAYSCHEDULE*)
- accessing student test scores (*DISPLAYTESTS*)
- accessing student grades (*DISPLAYGRADES*)
- entering student grades (*ENTERGRADES*)
- accessing student holds (*DISPLAYHOLDS*)
- accessing student transcripts (*TRANSCRIPT*)
- accessing student compliance information (*COMPLIANCE*)

This section discusses the following topics:

- Obsolete GTVSDAX Rules
- Conversion from GTVSDAX to SOAFACS
- Modified GTVSDAX Rules and Corresponding Self-Service Pages
- Faculty Member and Advisor Access to Self-Service
- All Access to Self-Service
- Check Order Functionality

## Obsolete GTVSDAX Rules

Rules on GTVSDAX used with security processing have been made obsolete. The associated security functionality is maintained on SOAFACS. The affected rules have a modified description of *Obsolete, Use SOAFACS form*, or for the *CHECKORDER* rule, *Obsolete, Use STVPROC form*. A script is delivered to inactivate these rules.

The following rules used with faculty and advisor access to processing in Self-Service are obsolete. Their descriptions refer to the form used for security processing.

External Code	Internal Code	Internal Code Seq Number	Internal Code Group	Description	Activity Date
Y, N	ADVRPIN	N/A	FACWEB	<i>Old</i> - Is Advisor PIN Control On?  <i>Updated</i> - Obsolete 8.3, Use SOAFACS form	Sysdate
A, F	CHECKORDER	N/A	FACWEB	<i>Old</i> - Access Order?  <i>Updated</i> - Obsolete 8.3, Use STVPROC form	Sysdate
Y, N	FACPIN	N/A	FACWEB	<i>Old</i> - Is Faculty PIN Control On?  <i>Updated</i> - Obsolete 8.3, Use SOAFACS form	Sysdate

## Modified GTVSDAX Rules

The *ALLADVR* and *ALLFAC* rules are no longer used for faculty and advisor security purposes. The associated security functionality has been moved to SOAFACS. However, these two rules still drive Self-Service display capabilities, and as such they will not be made obsolete. The rule descriptions have been updated in GTVSDAX to more accurately describe their current functionality.

The security functionality associated with the *ADVRTYPE* and *FACFATT* rules has been moved to SOAFACS. However, the rules are still used on GTVSDAX to determine whether to use the SOAFAPC rules for attribute/type checking with regard to the display of the Summary Faculty Wait List, Detail Faculty Wait List, and Detail Class List pages in Self-Service.

 **Note**

Refer to the “Modified GTVSDAX Rules and Corresponding Self-Service Pages” topic for current GTVSDAX functionality for the *ADVRTYPE* and *FACFATT* rules with regard to these Self-Service ages. ■

The security functionality associated with the *PRIMINSTR* rule has been moved to SOAFACS. However, this GTVSDAX rule must exist in order to display the Summary Faculty Wait List, Detail Faculty Wait List, and Detail Class list pages in Self-Service.

 **Note**

Refer to the “Modified GTVSDAX Rules and Corresponding Self-Service Pages” topic for current GTVSDAX functionality for the *PRIMINSTR* rule with regard to these Self-Service pages. ■

External Code	Internal Code	Internal Code Seq Number	Internal Code Group	Description	Activity Date

## Conversion from GTVSDAX to SOAFACS

Faculty and advisor records that were processed using security rules on the Crosswalk Validation Form (GTVSDAX) will be processed through the rules in the SOAFACS form and SORFACS table. During the upgrade to this functionality, the values for these GTVSDAX rules will be translated from GTVSDAX and populated in SORFACS using a delivered conversion script.

The rules used on SOAFACS are delivered as system-required. With the exception of *ENTERGRADES*, each system-required process code from STVPROC has two associated rules on SOAFACS, one for faculty and one for advisor. The *ENTERGRADES* process is available for faculty only. The indicators (checkboxes) on the form will be updated based on existing GTVSDAX rules at your site.

### Note

It will be important to review your conversion, test these indicators when your upgrade has been performed, and confirm that faculty members and/or advisors do not have too much or too little access to student information. ■

Here is a list of the rules used on SOAFACS.

Rule/Indicator	Description
<b>Process Available on Self-Service</b>	<p>Checkbox used to indicate whether the process rule is active for the faculty member or advisor in Self-Service.</p> <p>When this indicator is checked, and faculty members or advisors meet the process rule, they have access to the process.</p> <p>When this indicator is unchecked, faculty members and advisors cannot access the process, but they can see the link to the process. A message is displayed indicating they do not have access to the process.</p>
<b>All Access</b>	<p>Checkbox used to indicate that no security is invoked for the process, and faculty members and advisors are able to view <i>all available student information</i> in Self-Service.</p> <p>Once this indicator has been checked, you cannot activate the settings for the other indicators except for the <b>Process Available on Self-Service</b> indicator.</p> <p>The <b>All Access</b> indicator <i>must</i> be unchecked in order to set the other indicators to checked or unchecked and activate those settings for the rule.</p>
<b>PIN Control</b>	<p>Checkbox used to indicate whether the student's PIN needs to be entered to access the process rule in Self-Service. When checked, the PIN is required.</p> <p><b>Note:</b> The <b>PIN Control</b> checkbox is not available for the <i>DISPLAYGRADES</i> or <i>ENTERGRADES</i> process rules.</p>
<b>Relationship</b> - Faculty - or -	<p>Checkbox used to require that the faculty member or advisor must have a teaching or advising relationship with the student, in order to access the process rule in Self-Service.</p>
<b>Relationship</b> - Advisor	<p>For example, when a faculty member is teaching a section in which the student is enrolled, and the Web page is displayed based on the student's ID, that faculty member can access the process.</p> <p>Or, when a faculty member is assigned to teach a section, and the Web page is displayed based on the CRN, that faculty member can access the process.</p>

<b>Rule/Indicator</b>	<b>Description</b>
<b>Primary</b> - Faculty - <i>or</i> - <b>Primary</b> - Advisor	Checkbox used to require that the faculty member or advisor must be the primary instructor or primary advisor for the student in order to access the process rule in Self-Service.  The faculty member must be the primary instructor on SSASECT to access the process.  The advisor must be the primary advisor on SGAADVR to access the process.
<b>Attribute Type Checking</b> - Faculty - <i>or</i> - <b>Attribute Type Checking</b> - Advisor	Checkbox used to require that the faculty attribute type or advisor type must be checked in order to access the process rule in Self-Service.  For faculty members, the system checks the attribute on SIAINST and then cross-references SOAFAPC.  For advisors, the system checks the advisor type on SGAADVR and then cross-references SOAFAPC.

Here is a comparison of the GTVSDAX rules and the indicators that perform the same processing.

<b>SOAFACS Indicator</b>	<b>GTVSDAX Rule</b>	<b>GTVSDAX Rule Status</b>
<b>PIN Control</b>	ADVRPIN	Obsolete
<b>Attribute Type Checking</b>	ADVRTYPE	Menu option dependent
<b>Attribute Type Checking</b>	FACFATT	Menu option dependent
<b>PIN Control</b>	FACPIN	Obsolete
<b>Primary</b>	PRIMINSTR	Menu option dependent
<b>All Access</b>	ALLFAC	Used for display
<b>All Access</b>	ALLADVR	Used for display
N/A	CHECKORDER	Moved to STVPROC, <b>Check Order</b> field

Your existing GTVSDAX rules will be converted using the delivered script, which will evaluate your rule settings and convert them to SOAFACS. You can then set the values and make them unique to faculty members or advisors for each process.

Here is a crosswalk that outlines each converted GTVSDAX rule, the SOAFACS process associated with the GTVSDAX rule, and the indicator that will drive access to that

process. Seven unique process rules are available on SOAFACS. With the exception of *ENTERGRADES*, which is available for faculty only, each rule can be assigned to faculty members and/or advisors, which provides a total of 13 system-required rules that can be used on SOAFACS.

<b>GTVSDAX Rule</b>	<b>Process</b>	<b>SOAFACS Indicator</b>
ALLFAC	all seven processes	<b>All Access</b> - faculty record
ALLADVR	all except <i>ENTERGRADES</i> <i>ENTERGRADES</i> not available for advisors	<b>All Access</b> - advisor record
ADVRPIN	all except <i>ENTERGRADES</i> , <i>DISPLAYGRADES</i> , <i>DISPLAYSCHEDULE</i> <i>ENTERGRADES</i> not available for advisors	<b>PIN Control</b> - advisor record
FACPIN	all except <i>ENTERGRADES</i> , <i>DISPLAYGRADES</i> , <i>DISPLAYSCHEDULE</i>	<b>PIN Control</b> - faculty record
ADVRTYPE	all except <i>ENTERGRADES</i> , <i>DISPLAYSCHEDULE</i> <i>ENTERGRADES</i> not available for advisors	<b>Attribute Type Checking</b> - advisor record
FACFATT	all except <i>DISPLAYSCHEDULE</i>	<b>Attribute Type Checking</b> - faculty record
PRIMINSTR	all except <i>DISPLAYSCHEDULE</i> for faculty  all except <i>ENTERGRADES</i> , <i>DISPLAYSCHEDULE</i> for advisors	<b>Primary</b> - both faculty and advisor

The *DISPLAYSCHEDULE* rule is delivered with the **All Access** indicator checked (Y), as this functionality was provided previously. It is important to test this functionality for faculty members and advisors to be certain the appropriate access is allowed.

The *CHECKORDER* rule on GTVSDAX has been replaced with functionality on STVPROC. Since the GTVSDAX rule is generic, your setting for this rule at the time of the upgrade will be converted to all seven system-required processes on STVPROC. Those STVPROC settings can then be customized based on the process.

GTVSDAX Rule	Process	STVPROC
CHECKORDER	<p data-bbox="695 285 919 312">all seven processes</p> <p data-bbox="695 342 1019 443"><i>CHECKORDER</i> for the <i>ENTERGRADES</i> process is only available for faculty</p> <p data-bbox="695 468 1019 564">No advisor rule is available for <i>ENTERGRADES</i> on SOAFACS</p>	<b>Check Order</b> field

### Modified GTVSDAX Rules and Corresponding Self-Service Pages

The *ADVRTYPE*, *FACFATT*, and *PRIMINSTR* rules control the display of Self-Service menu options and access to the associated pages.

<b>GTVSDAX</b>			
<b>Rule</b>	<b>Menu Options Driven by Rule</b>	<b>GTVSDAX Description</b>	<b>Functionality</b>
ADVRTYPE	<p><i>Faculty and Advisors Main Menu</i></p> <p><b>Summary Wait List</b> (bw1kfcw1.P_FacWaitListSum)</p> <p><b>Detail Wait List</b> (bw1kfcw1.P_FacWaitList)</p> <p><b>Detail Class List</b> (bw1kfcw1.P_FacClaList)</p> <p>These pages call the F_CheckCRNAccess function which then calls the F_CheckCRNProcess function. This second function checks the <i>FACFATT</i> and <i>ADVRTYPE</i> rules to determine whether to use the SOAFAPC rules for attribute/type checking.</p>	SOAFAPC Attribute/ Type Check	Rule determines whether to use SOAFAPC Attribute/Type.

Rule	Menu Options Driven by Rule	GTVSDAX Description	Functionality
FACFATT	<p><i>Faculty and Advisors Main Menu</i></p> <p>Summary Wait List (bw1kfcl.P_FacWaitListSum)</p> <p>Detail Wait List (bw1kfcl.P_FacWaitList)</p> <p>Detail Class List (bw1kfcl.P_FacClaList)</p> <p>These pages call the F_CheckCRNAccess function which then calls the F_CheckCRNProcess function. This second function checks the <i>FACFATT</i> and <i>ADVRTYPE</i> rules to determine whether to use the SOAFAPC rules for attribute/type checking.</p>	SOAFAPC Attribute/Type Check	Rule determines whether to use SOAFAPC Attribute/Type.
PRIMINSTR	<p><i>Faculty and Advisors Main Menu</i></p> <p>Summary Wait List (bw1kfcl.P_FacWaitListSum)</p> <p>Detail Wait List (bw1kfcl.P_FacWaitList)</p> <p>Detail Class List (bw1kfcl.P_FacClaList)</p> <p>These pages call the bw1kilib.F_CheckCRNAccess function which checks the <i>PRIMINSTR</i> rule.</p>	Primary Instructor Checking	Rule must exist to display data on these pages.

## Faculty Member and Advisor Access to Self-Service

The processes on STVPROC and their associated rules on SOAFACS determine which links can be accessed in Banner Faculty and Advisor Self-Service by faculty members and advisors.

### Note

The setting of the **PIN Control** indicator on SOAFACS is determined by the setting of the **Pin Control Allowed** indicator on STVPROC. ■

When the **Relationship**, **Primary**, or **Attribute Type Checking** indicators are checked for the advisor rule on SOAFACS for *DISPLAYGRADES*, access to CRN-based links will *not* be permitted. Only access to ID-based links will be permitted, including the Electronic Gradebook for a Student or Advisee Grade Summary pages in Self-Service. Other *DISPLAYGRADES* links will not permit access by advisors when any of these options are checked, to prevent advisors from directly entering a CRN and thus bypassing security. The **All Access** indicator allows advisors to select CRNs directly, because no security is invoked when the **All Access** indicator is checked.

Here is a comparison of how the rules affect access to Self-Service.

<b>Process</b>	<b>PIN Control Allowed?</b>	<b>Associated Self-Service Menu Options</b>
COMPLIANCE	Yes	<i>Faculty and Advisors Main Menu</i>  <i>Student Information Menu</i>  <b>Degree Evaluation</b> (bwlkfcap.P_FacDispCurrent)
DISPLAYGRADES	No	<i>Faculty and Advisors Main Menu</i>  <b>Midterm Grades</b> (bwlkfmgd.P_FacMidGrd)  <b>Final Grades</b> (bwlkffgd.P_FacFinGrd)  <b>Summary Class List</b> (bwlkfcwl.P_FacClaListSum)  <i>Faculty and Advisors Main Menu</i>  <b>Electronic Gradebook by Component</b> (bwlkegrb.P_FacGradeComponents)

Process	PIN Control Allowed?	Associated Self-Service Menu Options
		<i>Student Information Menu</i> Electronic Gradebook for a Student (bwlkegrb.P_FacIDShrmrksProc) Registration History (bwlkhreg.p_fac_reg_hist)
		<i>Faculty and Advisors Main Menu</i> Advisee Grade Summary (bwlkgrde.P_advfingrd) Faculty Grade Summary (bwlkgrde.P_FacFinGrd) Incomplete Grades Summary (bwlking.P_FacIncmpGrdSum)

When the **Relationship**, **Primary**, or **Attribute Type Checking** indicators are checked for the advisor rule on SOAFACS for *DISPLAYGRADES*, access to CRN-based links will *not* be permitted. Only access to ID-based links will be permitted, including the Electronic Gradebook for a Student or Advisee Grade Summary pages in Self-Service. Other *DISPLAYGRADES* links will not permit access by advisors when any of these options are checked, to prevent advisors from directly entering a CRN and thus bypassing security. The **All Access** indicator allows advisors to select CRNs directly, because no security is invoked when the **All Access** indicator is checked.

DISPLAYHOLDS	Yes	<i>Faculty and Advisors Main Menu</i> <i>Student Information Menu</i> View Holds (bwlkgstu.P_ViewHold)
DISPLAYSCHEDULE	Yes	<i>Faculty and Advisors Main Menu</i> <i>Student Information Menu</i> View Student Schedule (bwlkfstu.P_FacStuSchd) Student Week at a Glance (bwlkfshd.P_FacStuCrseSchd) Concise Student Schedule (bwlkcrse.P_FacStuSchd)

The *DISPLAYSCHEDULE* rule is delivered with the **All Access** indicator checked (Y), as all access to these links was provided previously. Security can be invoked for these links.

<b>Process</b>	<b>PIN Control Allowed?</b>	<b>Associated Self-Service Menu Options</b>
DISPLAYTESTS	Yes	<i>Faculty and Advisors Main Menu</i>  <i>Student Information Menu</i>  <b>Test Scores</b> (bwlktest.P_FacDispTest)
ENTERGRADES  This process is not available for advisors.	No	<i>Faculty and Advisors Main Menu</i>  <b>Midterm Grades</b> (bwlkfmgd.P_FacMidGrd)  <b>Final Grades</b> (bwlkffgd.P_FacFinGrd)  <i>Faculty and Advisors Main Menu</i>  <b>Electronic Gradebook by Component</b> (bwlkegrb.P_FacGradeComponents)  <i>Student Information Menu</i>  <b>Electronic Gradebook for a Student</b> (bwlkegrb.P_FacIDShrmrks Proc)  <i>Faculty and Advisors Main Menu</i>  <b>Incomplete Grades Summary</b> (bwlkingc.P_FacIncmpGrdSum)  <b>Summary Class List</b> (bwlkfcwl.P_FacClaListSum)
TRANSCRIPT	Yes	<i>Faculty and Advisors Main Menu</i>  <i>Student Information Menu</i>  <b>Academic Transcript Options</b> (bwlkftrn.P_FacDispTran)

Process	PIN Control Allowed?	Associated Self-Service Menu Options
CHECKORDER  <b>Check Order</b> field on STVPROC can be set to <i>Faculty</i> , <i>Advisor</i> , or <i>Both</i>	N/A	Access to Self-Service menu options depends on how the rule is set up on SOAFACS, but which rule is selected can require the <b>Check Order</b> field. <ul style="list-style-type: none"> <li>• When <b>Check Order</b> is set to <i>Faculty</i>, the faculty rule on SOAFACS is used for the process, if it is available.</li> <li>• When <b>Check Order</b> is set to <i>Advisor</i>, the advisor rule on SOAFACS is used for the process, if it is available.</li> <li>• When <b>Check Order</b> is set to <i>Both</i>, both faculty and advisor rules are evaluated, and the more permissive rule is used.</li> </ul>
Faculty and Advisor Security Information (bwlksecr.P_FacAdvrSecurity)  There is no STVPROC process associated with this Web page. However, the page reflects the use of the SOAFACS rules.	N/A	<i>Faculty and Advisors Main Menu</i>  Faculty and Advisor Security Information (bwlksecr.P_FacAdvrSecurity)  Reflects SOAFACS rules for review by faculty member or advisor

Notes for the Advisee Grade Summary page (bwlkgrde.P\_advfingrd):

- The security options on SOAFACS for *DISPLAYGRADES* include access to the Advisee Grade Summary page.
- When **All Access** is checked for *DISPLAYGRADES* on SOAFACS, the Advisee Grade Summary page displays only advisees, not all students.
- While the *DISPLAYGRADES* process on SOAFACS does apply to the Advisee Grade Summary page, there is no PIN control allowed for grades, and the advisor must have a relationship with the student in order for the advisee records to be displayed.
- The setting of **Relationship** checkbox will not influence access to the Advisee Grade Summary page, as an advisee/student relationship must always exist. Therefore, the **Primary** and **Attribute Type Checking** indicators are the security options that are applicable to Advisee Grade Summary page.

## All Access to Self-Service

The **All Access** checkbox on SOAFACS is used to indicate that no security is invoked for the process rule in Self-Service.

- When the **All Access** indicator is checked (set to *Y*), no other indicators may be checked for the rule.
- Once the **All Access** indicator has been checked, you cannot change the settings of the other indicators except for the **Process Available on Self-Service** indicator.
- With the exception of the **Process Available on Self-Service** indicator, the **All Access** indicator *must* be unchecked in order to set the other indicators to checked and have those settings invoked for the rule.

## Check Order Functionality

The *CHECKORDER* rule used on GTVSDAX is obsolete. Check order processing is controlled by the **Check Order** field on STVPROC. The indicator on STVPROC allows the choice of *Faculty*, *Advisor*, or *Both*.

An exception to this processing exists for the *ENTERGRADES* rule. Since the *ENTERGRADES* process is not allowed for advisors on SOAFACS, the only option used with the **Check Order** field for the *ENTERGRADES* rule is the *Faculty* option. While the field displays the values for *Faculty*, *Advisor*, or *Both*, only the value of *Faculty* can be saved for the *ENTERGRADES* rule.

When both the **Faculty** and **Advisor** checkboxes on SIAINST are checked for an ID, the check order processing may need to determine which SOAFACS rule to use.

1. The faculty member *or* advisor has a relationship with the student. *Check order processing is not used.*

When the faculty member or advisor advises the student but does not teach the student, the advisor rule is selected.

When the faculty member or advisor teaches the student, the faculty rule is selected.

For example, when the ID is both a faculty member and advisor:

- The faculty member teaches Student A.
- The advisor advises Student B.

When the ID is requesting information for Student A, the faculty rule is selected. Check order processing is not used.

When the ID is requesting information for Student/Advisee B, the advisor rule is selected. Check order processing is not used.

2. The faculty member *and* advisor have relationships with the student. *Check order processing is used.*

When the faculty member or advisor teaches *and* advises the *same* student, check order processing is used.

For example, when the ID is both a faculty member and an advisor:

- The faculty member teaches Student A.
- The advisor advises Student A.

When the ID is requesting information for Student A, check order processing is used.

When the ID is requesting information for Student/Advisee A, check order processing is used.

3. The faculty member *or* advisor does not have a relationship with the student. *Check order processing is used.*

For example, when the ID is both a faculty member and an advisor:

- The faculty member does not teach Student C.
- The advisor does not advise Student C.

When the ID is requesting information for Student C, check order processing is used.

When the ID is requesting information for Student/Advisee C, check order processing is used.

## Purge Process

The following purge process may be used to purge information in the Faculty Load Module.

### sipasgn.pc - Instructor Term Rule Purge

This process will purge, by user-defined parameters, the instructional assignments, the non-instructional assignments, and the workload term rules for the term specified.

## Banner Student Interface to Banner Human Resources

Please refer to the *Interfaces* chapter for information on the interface between Faculty Load data and Banner Human Resources.

# Faculty Load Reports

---

This section contains a sample of each report in the Faculty Load module. Parameter definitions have also been provided for your convenience.

The following reports are run through the Faculty Load module:

Instructor Schedule Report	(SIRASGQ)
Faculty Load Contract Analysis Report	(SIRCTAL)
Faculty Load Term Analysis Report	(SIRTRAL)
Instructional Assignment Purge	(SIPASGN)

## Instructor Schedule Report (SIRASGQ)

**Description** This report is used to print an instructor's schedule, with detailed information including session dates and times, course names and CRNs, rooms where the classes are being held, and enrollments, etc. Faculty salary information may be printed on faculty schedules, but only if the Banner Human Resources System is installed.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Process Term	Yes	Enter the term for which you want the instructor's schedule to be printed.	Term Code Validation Form (STVTERM)
	ID Number	No	Enter the ID number for the instructor for which you want the schedule run (multiple requests permitted). Entering % will select all instructors.	
	Part of Term (% for all)	No	Enter the part of term code for which the instructor's schedule is to be printed. Multiple parts of term can be entered, or a % can be used to indicate that all parts of term within the selected term are to be printed.	Part of Term Code Validation Form (STVPTRM)
	Print Salary	No	Enter <i>Y</i> to print the faculty member's salary on their schedule. Enter <i>N</i> when you do not want to print the faculty member's salary on their schedule.  The Banner Human Resources System <i>must</i> be installed in order to use this parameter.	Y Print salary N Do not print salary
	Salary Effective Date	No	Enter the effective date in DD-MON-YYYY format. This parameter is required if the Print Salary parameter is set to <i>Y</i> .

## Faculty Load Contract Analysis Report (SIRCTAL)

**Description** This report is used to calculate and print the Faculty Load contract analysis.

Parameters	Name	Required?	Description	Values
	Schedule Term	Yes	Enter the term for which you want the contract analysis to be printed.	Term Code Validation Form (STVTERM)
	ID Number	No	Enter the ID number for the instructor for which you want the contract analysis run (multiple requests permitted). Entering a <i>NULL</i> value will select all instructors.	
	Contract Type	No	Enter the faculty contract type for which the instructor's contract analysis is to be printed. Multiple contract types can be entered, or enter a <i>NULL</i> value to indicate that all contract types are to be printed.	Faculty Contract Type Code Validation Form (STVFCNT)
	Category Code	No	Enter the faculty category code for which you want the contract analysis to be run. Multiple category codes can be entered, or a <i>NULL</i> value will select all category codes.	Faculty Category Code Validation Form (STVFCTG)
	Staff Type	No	Enter the faculty staff type for which you want the contract analysis to be created. Multiple staff types can be entered, or enter a <i>NULL</i> value for all faculty staff types.	Faculty Staff Type Code Validation Form (STVFSTP)
	Instructor/Assignment Indicator	Yes	Enter <i>I</i> to select college and department for the instructor(s); enter <i>A</i> to select only instructors with assignments.	I Instructor college and department A Instructor assignments
	College Code	No	Enter the college code for which you want the contract analysis to be run (or <i>NULL</i> for all college codes). Multiple college codes can be selected.	College Code Validation Form (STVCOLL)

<i>Parameters</i>	<i>Name</i>	<i>Required?</i>	<i>Description</i>	<i>Values</i>
	Department Code	No	Enter the department code for which you want the analysis to be run. Multiple department codes may be entered, or enter a <i>NULL</i> value to select all department codes.	Department Code Validation Form (STVDEPT)
	Sort Field	No	A <i>NULL</i> value will sort by contract and name; enter <i>1</i> to sort by college, department, and contract; enter <i>2</i> to sort by college, department, contract and name; or enter <i>3</i> to sort by college, department, contract and ID number.	1 College, Department, Contract order 2 College, Department, Contract, Name order 3 College, Department, Contract, ID number order <i>NULL</i> Contract, Name
	Perform Analysis Indicator	No	Either <i>Y</i> or a <i>NULL</i> value will run the analysis, <i>N</i> if you don't want the contract analysis performed.	Y Run analysis (also <i>NULL</i> ) N Do not run analysis
	Satisfied/Unsatisfied Indicator	No	Enter <i>Y</i> to list contracts which have been satisfied, enter <i>N</i> to list contracts which have not been satisfied, or enter a <i>NULL</i> value to list all contracts, whether satisfied or not.	Y List satisfied contracts N List unsatisfied contracts <i>NULL</i> List all contracts
	Page Break	No	Enter <i>Y</i> to page break on each faculty member, or <i>N</i> or <i>NULL</i> for normal break.	Y Page break on faculty N Normal break (also <i>NULL</i> )
	Home Indicator	No	Enter <i>Y</i> to list home college and department for each faculty member, or <i>N</i> or <i>NULL</i> to list all colleges and departments.	Y List home college and department N List all colleges and departments (also <i>NULL</i> )

## Faculty Load Term Analysis Report (SIRTRAL)

**Description** This report is used to calculate and print the Faculty Load term analysis.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Schedule Term	Yes	Enter the term for which you want the term analysis to be printed.	Term Code Validation Form (STVTERM)
	ID Number	No	Enter the ID number for the instructor for which you want the term analysis run (multiple requests permitted). Entering a <i>NULL</i> value will select all instructors.	
	Contract Type	No	Enter the faculty contract type for which the instructor's term analysis is to be printed. Multiple contract types can be entered, or enter a <i>NULL</i> value to indicate that all contract types are to be printed.	Faculty Contract Type Code Validation Form (STVFCNT)
	Category Code	No	Enter the faculty category code for which you want the term analysis to be run. Multiple category codes can be entered, or a <i>NULL</i> value will select all category codes.	Faculty Category Code Validation Form (STVFCTG)
	Staff Type	No	Enter the faculty staff type for which you want the term analysis to be created. Multiple staff types can be entered, or enter a <i>NULL</i> value for all faculty staff types.	Faculty Staff Type Code Validation Form (STVFSTP)
	Instructor/Assignment Indicator	Yes	Enter <i>I</i> to select college and department for the instructor(s); enter <i>A</i> to select only instructors with assignments.	I Instructor college and department A Instructor assignments
	College Code	No	Enter the college code for which you want the term analysis to be run (or <i>NULL</i> for all college codes). Multiple college codes can be selected.	College Code Validation Form (STVCOLL)

Parameters	Name	Required?	Description	Values
	Department Code	No	Enter the department code for which you want the analysis to be run. Multiple department codes may be entered, or enter a <i>NULL</i> value to select all department codes.	Department Code Validation Form (STVDEPT)
	Sort Field	No	A <i>NULL</i> value will sort by college and department; enter <i>1</i> to sort by college, department, category, and staff type; enter <i>2</i> to sort by college, department, and name; or enter <i>3</i> to sort by ID number.	1 College, Department, Category, Staff type, Contract order 2 College, Department, Name order 3 ID number order NULL College, Department
	Perform Analysis Indicator	No	Enter <i>Y</i> or <i>NULL</i> to run the analysis, or enter <i>N</i> if you don't want the term analysis performed.	Y Run analysis (also NULL) N Do not run analysis
	Satisfied/Unsatisfied Indicator	No	Enter <i>Y</i> to list workload term rules which have been satisfied, enter <i>N</i> to list workload term rules which have not been satisfied, or enter a <i>NULL</i> value to list all workload term rules, whether satisfied or not.	Y List satisfied workload rules N List unsatisfied workload rules NULL List workload rules
	Page Break	No	Enter <i>Y</i> to create a page break on each faculty member, or enter <i>N</i> or <i>NULL</i> for a normal page break.	Y Page break on faculty N Normal break (also NULL)
	Home Indicator	No	Enter <i>Y</i> to list home college and department for each faculty member, or enter <i>N</i> or <i>NULL</i> to list all colleges and departments.	Y List home college and department N List all colleges and departments (also NULL)

### Housing Room Assignment Using Building and Room Genders

#### Gender Specific Buildings

If a building is specified as either a male building or a female building on the Building Definition Form (SLABLDG), only persons matching that building's specific gender are permitted to be assigned to the building.

If a gender is entered on (SLABLDG), it defaults to each room in the building on the Room Definition Form (SLARDEF). The default value cannot be changed to the opposite sex; however, the system does permit the removal of the original gender specification, which was the default value from SLARDEF. Yet, even if the gender is removed (*Not Available*) from the **Gender** field on the Room Definition Form (SLARDEF), the system only permits the assignment of those persons matching the gender that was specified to the room at the building level. There are no overrides provided to allow a person of an unknown or opposite gender to be assigned to the rooms in a gender specific building. These rules are used in batch and online processing of housing assignments.

#### Gender Non-Specific Buildings

If the gender of a building is not specified on the Building Definition Form (SLABLDG), then the **Gender** field is null or *Not Available*, and persons of all genders, male, female, and unknown, may be assigned to the building. Assignment will be made according to the following, online, room specific gender rules:

- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is designated as *Male* on the Room Definition Form (SLARDEF), only persons of male gender may be assigned to this room.
- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is designated as *Female* on the Room Definition Form (SLARDEF), only persons of female gender may be assigned to this room.

- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is *Not Available* on the Room Definition Form (SLARDEF), male, female, and unknown genders may be assigned to this room. This allows for married housing and co-ed rooms to be processed.

When performing the Batch Scheduling of Housing Assignments, the following rules are used:

- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is designated as *Male* on the Room Definition Form (SLARDEF), only persons of male gender may be assigned to this room.
- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is designated as *Female* on the Room Definition Form (SLARDEF), only persons of female gender may be assigned to this room.
- If the gender of the building is *Not Available* on the Building Definition Form (SLABLDG), and the gender of the room is *Not Available* on the Room Definition Form (SLARDEF), male, female, and unknown genders may be assigned to this room. However, the first applicant scheduled into the room defines the room gender for the Batch Scheduling process. (**Note:** The **Gender** field remains *Not Available* on SLARDEF.) If the first applicant assigned to the room has not designated a gender on the Dorm Room and Meal Application Form (SLARMAP), then no one else is scheduled in batch into the room, because the gender of the room remains unknown.

## Housing Module Deposits

The total amount of housing deposits which the applicant has paid for the term is displayed in the Key Information of the Room Assignment Form (SLARASG). The total amount of meal deposits for the term is displayed on the Meal Assignment Form (SLAMASG), and the total amount of phone deposits for the term is displayed on the Phone Assignment Form (SLAPASG).

These deposit amounts are summarized by a deposit type which exists on the Deposit Detail Control Form (TGADEPC). These deposit types are validated against the Deposit Type Validation Form (TTVDTYP). The deposit type for Housing Deposits must be *HOU*, *MEA* for meal deposits, and *PHO* for phone deposits.

Deposits maintained on the Student Payment Form (TSASPAY) or Billing Mass Date Entry Form (TSAMASS) or Account Detail Form (TSADETL) for the term which have not expired are summarized by deposit type, and the total amount for the term displays on the appropriate assignment form.

## Housing Module Assessment

The assessment of dormitory rooms, meal plans, and phone charges is user-defined based on the rules established on the Room/Meal/Phone Rate Code Rules Form (SLALMFE). Assessment rules are established by term to allow for different assessment rules for each term. The user can create assessment rules based on either a daily rate, a monthly rate, or a term rate. This gives the institution the ability to charge a daily rate for dormitory rooms, a term rate for meal plans, and a monthly charge for phone usage.

The Room/Meal/Phone Rate Code Rules Form has three sections for creating assessment rules: one for housing rates, one for meal rates, and the other for phone rates. Each section functions in the same manner. Prior to building these assessment rules, the user must establish the valid rate codes on the Room Rate Code Validation Form (STVRRCD), Meal Rate Code Validation Form (STVMRCD), and Phone Rate Code Validation Form (STVPRCD). Detail codes must also be created for each different charge that will be assessed. These are created on the Detail Code Control Form (TSADETC). The detail code must be established with the following category codes:

HOU	-	Housing assessments
MEA	-	Meal plan assessments
PHO	-	Phone assessments

The **Refundable** checkbox must be checked for these detail codes in order to process refunds.

After the validation tables and the detail codes have been created, the assessment rules can be built on Room/Meal/Phone Rate Code Rules Form (SLALMFE). Each rate code and how it will be assessed (daily, monthly, or term) is entered.

A detail code is then entered for the rate code followed by the base rate to be assessed. This base rate should be the daily rate if the assessment type is *D*, the monthly rate if the assessment type is *M*, or the term rate if the assessment type is *T*. The base rate will be multiplied by the calculated number of days, months, or terms, for the housing, meal or phone assignment. The base rate and the minimum charge must be less than or equal to the maximum charge. The days, months, and term associated with a dorm room, meal, or phone assignment are calculated on the Room Assignment Form (SLARASG), Meal Assignment Form (SLAMASG), or the Phone Assignment Form (SLAPASG) respectively. The user can then specify a minimum and maximum assessment amount. If the calculated assessment amount is less than the minimum, the minimum amount is assessed. If the calculated assessment amount is greater than the maximum amount specified, the maximum amount is assessed.

When the assignments are created on the Room Assignment Form (SLARASG), Meal Assignment Form (SLAMASG), and the Phone Assignment Form (SLAPASG), the user has the ability to review assessments by checking the **Review Assessments** checkbox in the Assessment Information window of each form. This calculates the assessment based on the rates on the Room/Meal/Phone Rate Code Rules Form (SLALMFE) and the

number of days, months, and terms associated with the assignment's beginning and ending date, but does not update the student's account in the Accounts Receivable module. For example, the beginning and ending dates used by the Housing Module for term 199001 were established as 27-AUG-1990 and 16-DEC-1990 on the Term Code Validation Form (STVTERM). This calculates out to 112 days, 3.64516 months, and 1 term. These values are multiplied by the base rate amount on SLALMFE to calculate the assessment amount. If a daily base rate of \$10.00 a day has been established then the applicant is assessed \$1120.00 (112 days \* \$10.00). If a monthly base rate of \$25.00 has also been established, then the applicant is assessed \$91.13 (3.64516 months \* \$25.00). The minimums and maximums are then applied.

To review an assessment, you may perform a Next Block to access the Assessment Information window.

When monthly charges are to be created, they will be assessed in monthly increments for as many months as specified or calculated on the assignment forms. This facilitates the ability to charge apartment rentals on a monthly basis. In the previous example the following monthly charges would be assessed:

27 Aug 1991	\$25.00
27 Sept 1991	\$25.00
27 Oct 1991	\$25.00
27 Nov 1991	\$16.13 (.64512 x \$25.00)

There is a 12 month limit on monthly assessments.

Reviewing assessments does not update Accounts Receivable with the charges. The **Review Assessments** checkbox is used to test the assessment process for a sampling of students to insure that the assessment rules are established correctly.

There are two methods for assessing the housing, meal and phone assignments and updating the person's account in the Accounts Receivable module.

- The first method is to individually assess each person online by checking the **Process Assessments** box on the Dorm Room Assignment Form (SLARASG), Meal Assignment Form (SLAMASG), and the Phone Assignment Form (SLAPASG).
- The second method is to run the Batch Fee Assessment Process (SLRFASM) to assess all persons with housing, meal, and phone assignments for the term. The charges assessed may then be viewed on the Student Payment Form (TSASPAY), the Account Detail Form (TSADETL), or the Account Detail Review Form (TSAAREV). The source types associated with these charges are: DORM = B, MEAL = V, PHONE = U.

The refunding of assessments may be processed in two methods.

- The first method is to apply a refund percentage to the appropriate assignment status code. The status codes must be created on the Room Assignment Status

Code Validation Form (STVASCD), Meal Assignment Status Code Validation Form (STVMSCD), and Phone Assignment Status Code Validation Form (STVPSCD). The status code effective dates and refund percentages are established on the Room Assignment Status Form (SLAASCD), Meal Assignment Status Form (SLAMSCD), and Phone Assignment Status Form (SLAPSCD).

- The second method is to adjust the assignment dates and recalculate the day and/or months on the Room Assignment Form (SLARASG), Meal Assignment Form (SLAMASG), and the Phone Assignment Form (SLAPASG). Method two is only appropriate when using daily and monthly rates.

When the assessment is processed for the assignment, an adjustment will be written to the student's account detail for the difference between the original assessment and the new assessment.

Remember, the **Refundable** checkbox on TSADETC must be checked for the detail code in order to process refunds.

## Batch Scheduling of Housing Assignments

Batch scheduling of housing assignments is a process used to schedule housing applicants into the available dormitory rooms for a user-requested term.

There are two steps in the Batch Scheduler Process.

1. The first step is to run `slrsche.pco`. This process can be run through job submission. This is a COBOL program which extracts the building, room, and application data from the database, and creates a temporary assignment file based on the applicant's preferences, priorities, and attributes. The only parameter selection for this step is the processing term. The Term Code parameter, as well as username and password, must be updated in the exact positions in `slrsche.prm`.
2. The second step is to run the Batch Scheduler Report (SLRSCHD). In update mode this step can update the database with the assignment information from the previous step. If the assignment information is not in its final form, then the step can be run in audit mode which will not update the database. A report is also produced in this step. This report gives the complete scheduling information about each applicant's preferences, priorities, gender, and attributes, and the room which is assigned. Applicants who could not be scheduled are also listed on the report.

These steps can be run multiple times in audit mode until the best utilization of applicants to available dorm rooms is achieved.

The user can select one of three sort options for the Batch Scheduler Report (SLRSCHD): Applicant name, Applicant ID, or Applicant priority number. The report lists those applicants who were scheduled, followed by the applicants who could not be scheduled.

When running in Update mode the following selection options must be specified:

*Room Rate Code* - This is the rate code which is used if no rate code exists on the Room Definition Form (SLARDEF) for the room being assigned. This rate code must exist on the Room Rate Code Validation Form (STVRRCD).

*Room Assignment Status* - This is the dorm room status code used for the assignment. This updates the **Status** field on SLARASG. This status must exist on the Room Assignment Status Code Validation Form (STVASCD).

*Room Assignment Status Date* - This is the date associated with the room assignment status. This date must fall within the range established on the Room Assignment Status Form (SLAASCD).

The scheduling is done using a variety of institution and student specified elements. The batch scheduler methodology is listed below:

*Room Type* - Only rooms designated as dormitory rooms as "Dormitory" in the **Room Type** radio group on the Room Definition Form (SLARDEF) are loaded into the scheduler.

*Room Priorities* - Each room can be defined with a room priority. This is done on the Room Definition Form (SLARDEF). This room priority is used when loading the available dormitory rooms into the batch scheduler. The lower the number - the higher the priority. For example, rooms with a priority of "1" are scheduled first. All rooms with the same priority are then sorted by building code and ascending sequence room number. If an institution wishes to use all of its single rooms first then these rooms should be given a priority of "1".

If not entered, the room priority on SLADREF defaults to "99999999". The following is an example of how rooms would be loaded into scheduler:

<b>Priority</b>	<b>Building Code</b>	<b>Room Number</b>
1	Adams	202
1	Burns	101
1	Burns	102
1	North	101
99999999	Adams	101
99999999	Adams	102
99999999	Adams	104
99999999	Burns	102

*Room Capacity* - Rooms where the capacity equals zero are not loaded into the scheduler.

*Beds Remaining* - The applicants which have already been assigned to the dormitory room are checked prior to each room being loaded into the scheduler. For example, if a group of applicants has already been manually assigned to dormitory rooms before the scheduler is run, then these beds are not available to be scheduled via the batch scheduler. Dorm room

South 101 has a capacity of four. Two applicants have already been assigned to the room. When South 101 is loaded into the scheduler it is loaded with only two beds available. This prevents rooms from being over-allocated by the scheduler.

*Inactive Rooms* - Rooms which have been marked inactive are not loaded into scheduler. There are two different methods used to inactivate a room.

1. The **Status** field on the Room Definition Form (SLARDEF), which is validated against the Room Status Code Validation Form (STVRMST), can be used to flag the room as inactive.
2. The room can also be inactivated for a period of time via the Room Inactivation information on the Room Definition Form. If the room is inactive for any day during the term being scheduled, then the room is not available for scheduling.

*Room Gender* - Each room can be specified with a gender designation. Rooms designated as *Male* rooms can only be assigned to male applicants and *Female* gender rooms to female applicants. If the room gender designation is *Not Available*, then the first applicant scheduled into the room defines the room gender for the scheduling process. (**Note:** The gender designation remains *Not Available* on SLARDEF.) If the first applicant into the room has not designated a gender on the Housing and Meal Application Form (SLARMAP), then no one else is scheduled into the room because the gender of the room is unknown.

*Housing Applicants* - The batch scheduler loads those applicants for the user selected term who have requested a room assignment. This selection is done using the **Application Type** field on the Housing and Meal Application Form (SLARMAP) and the Room and Meal Application Type Validation Form (STVARTP). The following applicants are not processed by the batch scheduler:

1. Applicants who have requested only a meal assignment.
2. Applicants who have already received a dorm room assignment for the term.
3. Applicants whose application has been inactivated via the **Application Status** on SLARMAP and the Housing Application Status Code Validation Form (STVHAPS).

*Room Attributes* - The user may define attributes associated with each building via the Building Definition Form (SLABLDG). These attributes then default to the Room Definition Form (SLARDEF) for each room in the building. The building attributes can be deleted on SLARDEF or new room-specific attributes can be added. These attributes are then used to locate the best fit of applicants to available dorm rooms. Attributes can also be designated as "must match" attributes. These must match attributes are given special processing considerations in the scheduler. An applicant must have the same attribute specified on his Housing and Meal Application Form (SLARMAP) to be assigned to a room with a must match attribute. The attribute does not have to be designated as a must match attribute on the application; it must just exist.

The following example outlines this process:

Rooms	Capacity	Attributes	Scores by Applicants		
			1	2	3
North 101	2	Smok-checked	1	0	0
North 102	1	Coax Nsmk	0	0	1
North 103	2	Coax Smok-checked Hand-checked	0	0	0
North 104	1	Smok Coax Sngl Hand	3	N/A †	N/A †
North 105	1	Coax Sngl-checked Hand	0	2	0

† N/A - Not Available - due to full capacity

Applicants	Attributes
(1) 111-11-1111	Smok-checked Sngl Coax
(2) 222-22-2222	Sngl-checked Hand-checked
(3) 333-33-3333	Nsmk-checked Sngl

 **Note**

None of the applicants has specified a preferred building, category, or room number. ■

Applicant Number 1 has requested a smoking room, and the **Must Match (Indicator)** in the Special Attributes window of SLARMAP is checked. This means that only rooms with a smoking attribute are available for scheduling this applicant. This applicant also

requested a single room (Sngl) with a Coax cable (Coax). Neither of these attributes have been designated as "must match" so the scheduler will look for an available room with these as "best fit" attributes.

Keeping the applicant's attributes in mind, each available room will be examined and scored until the best fit of room attributes to applicant attributes can be accomplished.

North 101 is a smoking room, so it is available to the applicant, but it has no attributes for single room and Coax, so it receives a score of 1. North 102 is not specified as a smoking room, so it is not available for this applicant. It receives a score of zero. North 103 is a smoking room, but it has a "must match" attribute of handicap (Hand-checked), which means that only an applicant with a handicap attribute can be scheduled in the room. Hence, the room is not available for this applicant; it receives a score of zero. North 104 has a smoking attribute. It also has single room and Coax attributes, hence it receives a score of 3. North 105 has a no smoking attribute, so it receives a score of 0.

The room with the highest score is then used to schedule the applicant. Applicant number 1 is scheduled into North 104.

Under the same method of best fit scheduling, applicant Number 2 will be assigned to North 105 because of its score of two - single and handicap attributes available, and applicant number 3 will be scheduled into room North 102.

*Assignment Priorities* - Applicants are assigned to rooms in the user defined priority sequence. These priorities can be entered online on the Housing and Meal Application Form (SLARMAP), or they can be loaded via a user created SQL\*Plus loader program. As with the room priorities, the lowest priority is scheduled first. These priorities can be used to assign all of your freshman first or all the athletes first, whatever your institutional policy states. If no priority is entered it defaults to "99999999." The application add date and time is also used to further sort the applicants with the same priority code. If an applicant has no priority, they will be processed in application date order after the applicants with priorities. The following example outlines the priority processing for the applicants listed:

**Example:**

<b>Applicant</b>	<b>Priority</b>	<b>Date</b>
111-11-1111	1	01-MAR-1990
222-22-2222	1	03-MAR-1990
333-33-3333	1	03-MAR-1990
112-22-3322	2	02-MAR-1990
223-00-9099	to 99999999	01-MAR-1990

*Campus Request* - If the applicant requests a room assignment on a specific campus, then only the rooms on that campus are used. If no campus is specified on the Housing and Meal Application Form (SLARMAP), then any room regardless of its campus designation can be used for assignments.

*Room Preference* - The applicant may further specify building and category preference by adding a specific room preference. The scheduler then tries to schedule the applicant into the building and room requested. If the room is not available or the attributes cannot be matched, then the applicant is scheduled into the next available room within the building and category (if specified) if possible. A message is generated on the scheduler report which informs the user that the room requested was not available.

*Category Preference* - The applicant may further specify building preference by adding a building category preference. Categories can be used to further define buildings, for example, first floor, freshman floor, suites, wings. The scheduler then tries to schedule the applicant into the building and category which was requested. If no room is available or the attributes cannot be matched for the category requested, the applicant is scheduled into the next available room within the building if possible. A message is generated on the scheduler report which informs the user that a room in the requested category and building could not be located. Categories are only used within the buildings specified; they do not cross buildings. If the applicant specifies the first floor of North Hall building on the application and no rooms are available in North Hall, then the first floor category code is no longer used in scheduling.

*Building Preference* - The applicant may request a room in a specific building. The scheduler then tries to schedule the applicant into a room in the building which was requested. If no rooms exist in the building which meet the applicant's attributes, the applicant is scheduled into the next available building and room. A message is generated on the scheduler report which informs the user that a room in the preferred building could not be located.

*Roommate Preference* - The applicant can also specify preferred roommates on the Roommate Application Form (SLARMAT). An unlimited number of preferred roommates may be specified.

Once a roommate application has been completed, all roommates whose **Acceptance** checkbox is checked on SLARMAT are scheduled together as a group into the best fit available room.

The highest priority of the group is used as the priority and the gender of highest priority applicant is used to designate the room gender being requested.

 **Note**

The gender and priorities of each roommate in the group do not have to match for scheduling. ■

The Roommates Room Preference information and Roommate Room Attribute information on SLARMAT are used to locate the best fit room for the group of roommates. These preferences and attributes are used in the same manner as an individual applicant preferences and attributes.

If no room with enough capacity or with the required attributes is available for the group of roommates, then each applicant is scheduled as an individual using his/her own

preferences and attributes specified on their Dorm Room and Meal Application Form (SLARMAP).

The Scheduler Report lists the roommates scheduled and the roommate preferences and attributes used to perform the scheduling.

 **Note**

The scheduler has a limit of 10,000 applicants and 5,000 rooms for processing. There is also a limit of 10 attributes per applicant and per room for batch scheduler processing. ■

## Assignment Roll Process

Room Assignment, as well as meal and phone assignments can be rolled forward from one term to the next. The user, via parameter option, specifies the from and to term to be used in the roll process. The assignments will not be rolled forward unless the from and to terms are both within the same dorm room and meal application. For example, the applicant's application term range on SLARMAP is from 199001 to 199002. The user requests the assignment roll to be run to roll 199001 to 199002. The applicant will be processed. If another applicant's application is for a single term of 199001, then the assignment will not be created for the future term. This process does not roll a meal, phone, or room assignment if one already exists for the term to which assignments are being rolled. Only the time period associated with the rate code is calculated in the room assignment process.

 **Note**

The roll process checks room capacity based on the start and end dates of the housing terms, so these dates should not overlap between consecutive terms. ■

The user can also prevent an applicant from being rolled by checking the **Prevent Roll** checkbox on the assignment forms (SLARASG, SLAMASG, SLAPASG). Both meal and phone assignments may be prevented from being rolled by the status codes associated with these assignments. The Meal Assignment Status Code Validation Form (STVMSCD), the Phone Assignment Status Code Validation Form (STVPSCD), the Meal Assignment Status Query Form (SLQMSCD), the Phone Assignment Status Query Form (SLQPSCD), the Meal Assignment Status Form (SLAMSCD), and the Phone Assignment Status Form (SLAPSCD) allow the user to specify if assignments with a certain status may be rolled.

The roll process can be run in either audit or update mode. The Assignment Roll Process (SLRROLL) lists the assignments which will be rolled.

## Housing Letter Generation and Population Selection

The following variables should be used for creating housing letters.

The variables listed below are specific to information that would be printed about a roommate in a housing assignment letter.

<b>Variable</b>	<b>Description</b>
*ROOMMATE	Roommate Name
*RM_PHONE	Roommate Phone Number
*RM_ADDRESS_STR1	Roommate Address Street Line 1
*RM_ADDRESS_STR2	Roommate Address Street Line 2
*RM_ADDRESS_STR3	Roommate Address Street Line 3
*RM_ADDRESS_CITY	Roommate Address City
*RM_ADDRESS_STATE	Roommate Address State
*RM_ADDRESS_CNTY	Roommate Address County Code
*RM_ADDRESS_NATN	Roommate Address Nation Code
*RM_ADDRESS_ZIPC	Roommate Address Zip Code

The variables listed below are specific to information that would be printed about the person receiving a housing assignment letter.

<b>Variable</b>	<b>Description</b>
*FNAME	First Name
*LNAME	Last Name
*MNAME	Middle Name
*PHONE	Telephone Number
*STR1	Address Street Line 1
*STR2	Address Street Line 2
*STR3	Address Street Line 3
*CITY	Address City
*STATE	Address State Code
*NATN	Address Nation Description
*ZIPC	Address Zip Code
*TDATE	Today in Month dd, yyyy Format
*BUILDING_NAME	Housing Building Description
*ROOM_NUMBER	Housing Room Number

The variables listed below are used to support logic in the Housing sample letter, but do not print.

Variable	Description
*ALWAYS_NULL	Always Null
*COUNT_OCCUPANCY	Count Room Occupancy of 1
*COUNT_ROOMMATES	Count Number of Roommates
*NO_ROOMMATES	No Roommates in Room
*ONE_ROOMMATE	One Roommate in Room
*TOTAL_IN_ROOM	Count Total Room Occupancy

The variables listed below are specific to information that would be printed about a roommate in a housing assignment letter.

Variable	Description
*RM_FIRST_NAME	Roommate First Name
*RM_ADDRESS_CNTYDESC	Roommate Address County Desc
*RM_ADDRESS_NATNDESC	Roommate Address Nation Desc
*RM_ADDRESS_SUBZIPC	Roommate Address 5 Digit Zip
*RM_ADDRESS_FULL	Roommate Complete Address
*RM_ADDRESS_CSZ	Roommate Addr City, State, Zip

## Dynamic Parameter

A dynamic parameter for term code (&Term\_Code) must be entered when processing many of the Housing variables. The prompt is spelled consistently as &Term\_Code so that a valid term only needs to be entered once during processing, and all variables with the same prompt will automatically use the same value for the term code.

## Housing Population Selection

The Housing population selection consists of:

Parameter	Value
Application:	HOUSING
Selection ID:	HOUSING_ASSIGNMENTS
Creator ID:	SAISUSR

The population selection rules include a dynamic parameter for term code (&Term\_Code). This population selection will return all persons with an active housing assignment for the term code that is entered.

## Purge Process

The following purge process is part of the Location Management and Housing module.

### slphous.pc - Housing Purge

This process will purge the housing applications, housing, meal plan, and phone assignments for the user specified terms and activity dates. These assignment assessments must have been processed and accepted in the Accounts Receivable module.

## Location Management Reports

---

This section contains a sample of each report in the Location Management and Housing module. Parameter definitions are also provided for your convenience.

The following reports are run through the Location Management and Housing module:

Dormitory Address Creation Report	(SLRDADD)
Active Housing Assignments Report	(SLRHLST)
Batch Room/Meal/Phone Assess Report	(SLRFASM)
Assignment Roll Process	(SLRROLL)
Batch Scheduler	(SLRSCHD)
Housing Purge	(SLPHOUS)
ACS Housing Interface	(SLRBACS)

## Creating a Population Selection

To perform population selection, the application you will be working with must first be defined on the Application Definition Rules Form (GLRAPPL).

The second step is to enter the Population Selection Definition Rules Form (GLRSLCT), enter the **Application (Code)**, and create a **Selection ID (Identifier)** with a description.

In the Selection Definition section, define the **Select** and **From** portions of the SQL statement that the selection represents.

### **Example:**

Select: SARADAP\_PIDM  
From: SARADAP

Next, enter the Selection Rules for the population of records you would like to see.

**Example:**

```
SARADAP_TERM_CODE_ENTRY    =    '200010'        AND
SARADAP_LEVL_CODE          =    'UG'
```

Save your data and exit. Your population selection rules will be compiled. If any errors are issued during the compilation process, resolve the errors before continuing. If you do not resolve all errors given during the compile process, you will not be able to use the population selection rules to extract a population.

You are now ready to extract the population of people. The Population Selection Extract (GLBDATA) is run from the Process Submission Control Form (GJAPCTL). At minimum, you will need to supply the parameters for Selection Identifier 1, Application, and Creator ID, which are the values that were in the Key Information of the Population Selection Definition Rules Form (GLRSLCT).

After extracting the population, you can use the Population Selection Extract Data Form (GLAEXTR) to view and/or modify the people in the population. You can add or delete people from the population using this form. The keys to the form are **Application**, **Selection ID**, and **Creator ID**. (**User ID** is also displayed in the Key Information.) You will be able to add or delete people only from populations that you selected.

After extracting the population, and modifying the people in it if necessary, you can use the population for a variety of purposes. Letters can be produced using Letter Generation, based upon a population, and many Banner® reports and processes also can accept a population for processing.

For additional details on population selection, refer to the *Banner General System User Guide*.

## Dormitory Address Creation Report (SLRDADD)

**Description** This report is used to create dormitory address information from the housing assignments. The address associated with the dormitory assignment is maintained in the Building Definition Form (SLABLDG). This job will create a dormitory address for each active room assignment that falls within the requested room assignment date.

A check prevents a new dormitory address from being created if a record of the type selected in the parameters exists with no effective dates. For example, if a Dormitory Address (DO) exists with no effective dates and the Dormitory Address Creation Report is run for the term 199301, and a new DO address is to be created based on the person's assignments, an error message is generated, and no update will occur.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Process Term	Yes	Enter the term code representing the term for which the assignments are to be created.	Term Code Validation Form (STVTERM)
	Room Assignment Date	Yes	Enter the date on which the assignments take effect. This parameter is used to specify that only those room assignments which are active on the date selected are used to create address records.  For example, if an assignment runs from 9/1 through 9/15, and the user enters 9/16 in this parameter, then the assignments will not be selected.	
	Address Type	Yes	Enter the address type by which the created address should be referenced.	Address Type Code Validation Form (STVATYP)
	Address Source	No	Enter the address source by which the created address should be referenced.	Address Source Validation Form (STVASRC)

## Report Sample—Dormitory Address Creation Report (SLRDADD)

RPTNAME: SLRDADD TERM: 199610 ROOM ASSIGNMENT DATE: 26-AUG-1995 ADDRESS TYPE: DA ADDRESS SOURCE: INFR		
STUDENTS SELECTED: 2 NUMBER OF POTENTIAL ADDRESS CREATIONS: 2 NUMBER OF ACTUAL ADDRESSES CREATED: 2		

## Active Housing Assignments Report (SLRHLST)

**Description** This report is used to list all of the active housing assignments.

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code representing the term for which the assignments are to be repeated.	Term Code Validation Form (STVTERM)
	Room Assignment Date	No	Enter the date for which the room assignment should be selected. Leave blank for today's date, or enter the date selected in date format DD-MON-YYYY.	
	Report Sequence	Yes	Enter 1 to print the report in name order, enter 2 to print in ID number order, or enter 3 to print in building/room order.	1 Name order 2 ID number order 3 Building/room order
	Address Selection Date	No	Which address, effective on this date, do you wish to have print on the Active Housing Assignment Report? Leave blank for today, or enter in date format DD-MON-YYYY.	
	Address Hierarchy	Yes	Enter the address type to be printed on the report; multiple requests are permitted and must be entered in priority sequence.  For example, <i>IMA 2PR</i> will first print the mailing address, and if none is found, will print the permanent address.  Enter each parameter then hit return for the next prompt. Returning with a null value will move you on to the next parameter.	Address Type Code Validation Form (STVATYP)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.

## Batch Room/Meal/Phone Assess Report (SLRFASM)

**Description** This report is used to provide batch assessment for room, meal, and phone charges.

The process automatically populates the Original Indicator to *Y*, for the first time assessment occurs, for a specific detail code, for the student, for the term, and for all assessments prior to the cutoff dates established on SLATERM.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Process Term	Yes	Enter the term code representing the term for which the assessments are to be calculated.	Term Code Validation Form (STVTERM)
	Process Indicator	Yes	Enter <i>O</i> to batch assess all outstanding room, meal, and phone charges; enter <i>%</i> to assess everyone.	<i>O</i> Assess room, meal, phone <i>%</i> Assess everyone
	Update Bills	Yes	Enter <i>N</i> if you do not want to update the student's bills, or <i>Y</i> to update the bills.	<i>Y</i> Update bills <i>N</i> Do not update bills
	Sort Sequence	Yes	Enter <i>I</i> to sort by ID number, or <i>N</i> to sort by name.	<i>I</i> ID number order <i>N</i> Name order

## Assignment Roll Process (SLRROLL)

**Description** This process is used to roll one term's housing, meal, and phone assignments forward to another term.

Parameters	Name	Required?	Description	Values
	From Term	Yes	Enter the term code representing the term from which the housing, meal, and phone assignments are to be rolled.	Term Code Validation Form (STVTERM)
	To Term	Yes	Enter the term code representing the term to which the housing, meal, and phone assignments are to be rolled.	Term Code Validation Form (STVTERM)
	Report Mode	Yes	Enter <i>A</i> for Audit mode or <i>U</i> for Update mode. Audit mode does not update the database and is useful for identifying errors which can then be corrected for a roll in update mode.	A Audit U Update
	Roll Room Assignments	Yes	Enter <i>Y</i> to roll room assignments, <i>N</i> to not roll room assignments.	Y Roll assignments N Do not roll assignments
	Room Assignment Status Code	No	Enter the status code for the room assignment. This code will be the status assigned to the rolled room assignments. Only one active room assignment is rolled at a time.	Room Assignment Status Code Validation Form (STVASCD)
	Room Assignment Status Date	No	Enter the date on which the room assignment becomes effective.	
	Roll Meal Assignments	Yes	Enter <i>Y</i> to roll meal assignments, <i>N</i> to not roll meal assignments.	Y Roll assignments N Do not roll assignments
	Meal Assignment Status Code	No	Enter the status code for the meal assignment. Only one active meal assignment is rolled at a time.	Meal Assignment Status Code Validation Form (STVMSCD)

Parameters	Name	Required?	Description	Values
	Meal Assignment Status Date	No	Enter the date on which the meal assignment becomes effective.	
	Roll Phone Assignments	Yes	Enter <i>Y</i> to roll phone assignments, <i>N</i> to not roll phone assignments.	Y Roll assignments N Do not roll assignments
	Phone Assignment Status Code	No	Enter the status code for the phone assignment. Only one active phone assignment is rolled at a time.	Phone Assignment Status Code Validation Form (STVPSCD)
	Phone Assignment Status Date	No	Enter the date on which the phone assignment becomes effective.

## Batch Housing Schedules Report(SLRSCHE)

**Description** This report is used to extract the building, room, and application data from the database, and create a temporary assignment file for a processing term, based on the applicant's preferences, priorities, and attributes.

**Note**

You must run SLRSCHE before running SLRSCHD, to create the temporary assignment file of data to be used when SLRSCHD is run. ■

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term	Yes	Enter the term code for the term to be used when creating the temporary assignment data. The data is then used when SLRSCHD is run.	Term Code Validation Form (STVTERM)

---

There is no hardcopy output associated with this report.

## Batch Scheduler Report (SLRSCHD)

**Description** This report is used to create dormitory housing assignments in batch mode, based on the applicant's preferences.

**Note**

You must run the COBOL program `slrsche.pco` first, to create a temporary assignment file of data to be used in running SLRSCHD. ■

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code representing the term for which the assignments are to be created.	Term Code Validation Form (STVTERM)
	Report Order	Yes	Enter <i>I</i> to run the report in ID number order, <i>N</i> to run in name order, or <i>P</i> to run in application priority order.	I ID number order N Name order P Application priority order
	Report Mode	Yes	Enter <i>A</i> to run in Audit mode or <i>U</i> to run in Update mode. Audit mode does not update the database and is useful for identifying errors which can then be corrected before update mode.	A Audit U Update
	Room Rate Code	Yes	Enter the desired rate code for the rooms to be scheduled. This parameter is required whether the report is run in Audit mode or Update mode.	Room Rate Code Validation Form (STVRRCD)
	Room Assignment Status Code	Yes	Enter the status code for the room assignment. This parameter is required whether the report is run in Audit mode or Update mode.	Room Assignment Status Code Validation Form (STVASCD)
	Room Assignment Status Date	Yes	Enter the date on which the room assignment becomes effective. This parameter is required whether the report is run in Audit mode or Update mode.

## Housing Purge (SLPHOUS)

**Description** This process will purge the housing applications, housing, meal plan, and phone assignments for the user specified terms and activity dates. These assignment assessments must have been processed and accepted in the Accounts Receivable module. The user may choose either of two options: option 1 is purge by term, and option 2 is purge by term and activity date.

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code representing the term for which the housing information is to be purged.	Term Code Validation Form (STVTERM)
	Purge Option	Yes	Choose from one of the two purge options listed in the description, purge by term or purge by term and activity date.	
	Activity Date	No	Housing assignments with activity dates that match the date entered will be purged. Enter in date format DD-MON-YYYY.	
	Run Mode	Yes	Enter <i>A</i> to produce a listing of all selected purge data without affecting the database. Enter <i>U</i> to update the database after purging the selected data.	A Audit U Update

## ACS Housing Interface (SLRBACS)

**Description** This report reads Banner files and extracts the specified data into a file for use by the Applied College Systems (ACS) Housing Information System (HIS). The printed output is shown in a control report with totals of the records sent. A transaction file is also produced, which is formatted and ready to be run through the ACS HIS. This reduces the amount of data entry required in the Housing Information System.

Parameters	Name	Required?	Description	Values
	Term Code	Yes	Enter the term code to be used to select housing application records for the ACS HIS file.	Term Code Validation Form (STVTERM)
	Address Selection Date	No	Enter the date in DD-MON-YYYY format for the address(es), effective on this date, to be extracted for the ACS HIS file. The system date is the default if this parameter is left blank.	
	Address Type	Yes	Enter the address type to be used in the selection of the addresses. Up to two address types may be requested.

## Recruiting Procedures

---

### Add/Maintain Prospects

To recruit a prospect, after a prospect's identification number and name have been entered on the General Person Identification Form (SPAIDEN), the Recruit Prospect Information Form (SRARECR) is used to enter and maintain the information necessary for all recruitment related activities. This information includes the source of the prospect (high school, mailings, alumni, etc.), intended degrees and majors, outside interests, contacts, comments, attributes, and cohort information for student tracking.

The Quick Recruit Form (SRAQUIK) can also be used when entering information about a recruit or a group of recruits which may have some of the same characteristics. The Default Options window allows the user to enter default information such as address type, contact type code, recruiter code, recruitment status code, source code, term code, high school code, prior college code, level code, degree code, college code, department code, and major code for all records being processed. This speeds the data entry process when a batch of recruits from a local high school or all recruits from the same prior college are being processed together. The default options are in effect only for the current SRAQUIK session; once the user has exited the form, the options no longer apply.

If a prior college or high school record is entered on this form, the corresponding admissions checklist request code is updated on the Prior College Form (SOAPCOL) and High School Information Form (SOAHSCH), if it is defined on Source/Background Institution Code Validation Form (STVSBGI). If multiple prior colleges or high schools are added for a single recruit, only the first entered record will be assigned the admissions checklist request code.

### Add/Maintain Test Scores

Once a prospect has been established on the database, the various types of tests required for recruiting a prospect are entered on the Test Score Information Form (SOATEST). Test scores for SAT, ACT, GRE, GMAT, and AMCAS tests may also be loaded onto the system from test score tapes and are recorded on this form.

## Add/Maintain High School Data

The High School Information Form (SOAHSCH) is used to enter information about a person's high school career. The information includes high school, transcript dates, graduation date, GPA, and subjects taken in high school.

## Add/Maintain Prior College Data

The Prior College Form (SOAPCOL) is used to enter and maintain information about a person's prior college experience including degree information such as majors, minors, and areas of concentration, number of hours, GPA, and transcript date.

## Review Prospects

The Recruiter's Prospect Form (SRARINF) is used to display all the prospects for which a recruiter has responsibility. The prospect's name, ID number, and status are displayed.

## Assign/Review Recruiter's Appointments and Visits

The Recruiter Appointments/Visits Form (SRARAPT) is used to schedule and record daily appointments with prospects and to record visits to recruiting sources such as a college night. Appointments and visits may be viewed for a given day or range of days. If a recruiter is absent, it provides a quick method to review their schedule.

## Establish Source, High School, or College

The Source or Background Institution Base Form (SOASBGI) is used to capture general information about a source, high school, or college. Information such as address, contacts, comments, or directions may be used by the recruiter to aid in the recruitment process.

## Build Statistical Information for a Source or Background Institution

Statistical information about a source, high school, or college may be maintained on a yearly basis on the Source/Background Institution Year Form (SOABGIY). This information may be used for statistical data on the institution's recruiting procedures.

## Review Prospects and Visits by Source

The Source Visits/Prospects Form (SRASRCE) displays prospects by the source of the prospect and also may be used to review and schedule visits to a particular source. This form may be used by the recruiter to schedule a college night visit at a high school and to view the prospects from that high school.

## Produce System-Generated Letters

Letters (generated) and materials (published) are defined using a variety of validation and control forms. Paragraph codes are defined on the Paragraph Code Validation Form (GTVPARA), and their text is defined using the Paragraph Form (GUAPARA). Letter codes are defined using the Letter Code Validation Form (GTVLETR), and the paragraphs which make up a letter are defined on the Letter Process Form (GUALETR). Materials and letters can be scheduled by the system based upon Communications Plans or can be entered directly on the Student Mail Form (SUAMAIL).

## Analyze Recruiting Enrollment

There are two reports you can use to analyze recruiting enrollment, the Recr/Enrl Analysis-Source/Recr Report (SRRENRL) and the Recr/Enroll Analysis-How Learned Report (SRRENRLH).

The Recr/Enrl Analysis-Source/Recr Report (SRRENRL) analyzes by source, recruiter, and contact type the number of people who have been recruited, applied, accepted, and registered for a specified term. The report also collects data based on source and recruiter codes and prints an optional section for source codes which have no corresponding recruiting data associated with them. Data is populated from SRRRSRC.

The Recr/Enroll Analysis-How Learned Report (SRRENRLH) provides recruiting information sorted by recruiter code for a given range of term codes. The data collected for the number of recruits, applications, and accepted and registered students is based first on the How I Learned About code and then on term. An optional section may be printed for How I Learned About codes which have no corresponding recruiting data associated with them. The How I Learned About code is populated when any Web for Prospects user fills in the appropriate field on the Web for Prospects page. That information is then pushed to the user's Banner® recruiting record. (The field can also be populated manually on SRARECR/SRRLEND.)

This report will assist schools in determining their success rate with various types of marketing and advertising methods. For instance, if a school is receiving little or no feedback from an expensive newspaper campaign but is receiving many calls based on a radio spot, the decision may be made to put more marketing dollars into radio and less into print ads. This report will help give the school the necessary information to make those types of decisions.

## Print/Delete Recruits Who Did Not Apply

The Recruits Never Applied to Institution Report Process (SRRINQR) prints, by option, a report of all prospects who never applied to the institution or deletes all records for those prospects.

## Appointment Scheduling

Appointments may be created and scheduled once a general person record exists. They are person related, rather than specific to a recruiting record. A recruiting record is not required to be built on the Recruit Prospect Information Form (SRARECR) in order to set up an appointment. Appointments are entered and maintained on the Person Appointments/Contacts Form (SOAAPPT). This form may be accessed from the Recruit Prospect Information Form (SRARECR).

A person may be scheduled for an appointment with a recruiter via the Recruiter Code or with an Interviewer. An interviewer is another person in the system and is defined via their ID.

Multiple appointments, as well as multiple contacts, may be entered for a person on the Person Appointment/Contacts Form (SOAAPPT). A person may have more than one appointment at the institution in a single day. Perhaps an applicant would like to schedule appointments with their Admissions counselor, a Financial Aid counselor, and their Academic Advisor in a single day. As long as each of these members of your institution is defined by an ID in your database, these appointments may be scheduled between the applicant and these parties on the Person Appointments/Contacts Form (SOAAPPT). Keep the following in mind for scheduling purposes.

- If a person for whom the appointment is being scheduled (the Key Information ID) has conflicting appointments, the message *\*WARNING\* Appointment already scheduled at this time for the person* is generated to inform the user of such a conflict.
- If the interviewer has conflicting appointments, the message *\*WARNING\* Appointment already scheduled at this time for the Interviewer* is generated.
- And if a conflicting appointment and or visit is created for the recruiter, the message *\*WARNING\* Appointment/Visit already scheduled at this time for the Recruiter* is generated.

A contact is not a required element when creating an appointment for a person. However, if a contact is entered, and a result code is entered that is to generate a contact, the contact will be generated for the person, and may be viewed in the Contact section of the Person Appointments/Contacts Form (SOAAPPT). Only one contact of the same contact code may be entered in a day. Multiple contact codes may be entered for a person in a single day, as long as the contact codes differ.

The Key Block of the Person Appointments/Contacts Form (SOAAPPT) requires an **ID** and has an optional **Appointment Range Start Date** and **End Date**. If the **Appointment Range Start Date** and **End Date** for appointments and contacts are left null, then all appointments and contacts will be queried. Otherwise, only those appointments and contacts which fall between the **Appointment Range Start Date** and **End Date** the user has specified will be queried.

The **Appointment From Date** and **To Date** fields in the Key Information of the Recruiter Appointments/Visits Form (SRARAPT) allow the user to enter a range of dates, a single date, or no dates for all records. The user may specifically query those days of interest for a recruiter's schedule.

If an appointment is to be scheduled with a recruiter, the end user may also schedule that appointment on the Recruiter/Appointments/Visits Form (SRARAPT) in the Appointments section. All appointments entered on the Person Appointments/Contacts Form (SOAAPPT) and scheduled with a recruiter will also display on this form and vice versa.

The Appointment Purge Process (SOPAPPT) will delete all person-related appointments for a parameter entered range of dates. This process may first be run in audit mode to verify the results before it is run in update mode; appointments are purged from the database.

## Communication Plan Processing

### Communication Plan Processing Overview

#### Introduction

Communication plan processing permits you to automatically assign a recruit, applicant, or student (learner) to a communication plan online, according to their campus, level, degree, college, field of study type, field of study code (major), curricula (primary, secondary, any), and the rules defined for your institution. You can define rules that will assign a communication plan based upon any field of study type (i.e., not just major) and/or elements in the primary curriculum, secondary curricula, or all curriculum records.

Automatic mail generation helps the institution communicate quickly and efficiently with prospects, applicants, and students. Based on the various “attributes” of a person and their stage of processing (recruiting, admissions, general student), the system generates different pieces of mail automatically. In the same manner, you can enter requests for specific mailings to be produced. All mailings are dated and marked with a material code, letter code, and communication plan where applicable, so you can keep a full audit trail of correspondence sent to a person. You develop the actual letters online to send to a person according to the specific needs of your institution.

## How Processing is Called by Module

Communication plan processing is called in a variety of situations, depending on the module for the curriculum record.

Processing is called from Recruiting when:

- new recruiting and curriculum records are added, and recruiting communication plan matches are found on SOACOMM,
- a new curriculum or field of study is added to a recruiting record, and new recruiting communication plan matches are found on SOACOMM (i.e., the communication plan did not already exist for the recruit),
- the withdrawal code is added or changed, or a new source/background institution code is added on SRARECR, and active communication plan records exist for the recruit,
- a curriculum record is deleted, and active communication plan records exist for the recruit,
- a recruiting record is deleted or inactivated, and active communication plan records exist for the recruit,
- a recruiting curriculum or field of study record is inactivated, and active communication plan records exist for the recruit, and
- the recruiting curriculum is changed, and active communication plan records exist for the recruit.

Processing is called from Admissions when:

- new application and curriculum records are added, and applicant communication plan matches are found on SOACOMM,
- a new curriculum or field of study is added to an applicant record, and new applicant communication plan matches are found on SOACOMM,
- the withdrawal code is added or changed, or a new source/background institution code is added on SAAADMS, and active communication plan records exist for the applicant,
- a curriculum record is deleted, and active communication plan records exist for the applicant,
- an admissions record is deleted or inactivated, and active communication plan records exist for the recruit,
- an admissions curriculum or field of study record is inactivated, and active communication plan records exist for the recruit, and
- the admissions curriculum is changed, and active communication plan records exist for the recruit.

Processing is called from General Student when:

- a decision is confirmed for an applicant (SAAQUIK and SAADCRV) that results in the creation of a new learner curriculum or a general student record, and new learner communication plan matches are found on SOACOMM,
- a general student record is duplicated on SGASTDN, and new communication plan matches are found on SOACOMM,
- a new curriculum or field of study is added to a general student record, and new learner communication plan matches are found on SOACOMM,
- the student status on SGASTDN is changed to *IS*, and active communication plan records exist for the learner,
- a curriculum record is deleted, and active communication plan records exist for the learner,
- a general student record is deleted or inactivated, and active communication plan records exist for the learner,
- a general student curriculum or field of study record is inactivated, and active communication plan records exist for the learner, and
- the general student curriculum is changed, and active communication plan records exist for the learner.

## Determining Material Recipients

A communication plan defines standard materials and groups of materials to be sent to a prospect/applicant/student at pre-defined time intervals. Once a person is assigned to a communication plan, material is generated on the Student Mail Form (SUAMAIL). Please note that the person must meet the material rule criteria for each specific material in order to receive all materials in the plan. Otherwise, only those materials within the plan for which the person is qualified are generated on the Student Mail Form (SUAMAIL).

In order to be qualified to receive a specific material, the person must meet all the required criteria as defined on the Material Form (SOAMATL). On this form, the institution defines the required attributes which a person must have in order to receive the material.

For instance, perhaps your institution has an Institutional Scholarship program called "Presidential Scholarship for Freshman Minority Students". You would only like those students that have: (1) received a score of 700 or better on either the Math SAT or the Verbal SAT, (2) are members of a minority ethnic group, and (3) are new freshman at your institution. The Material Form (SOAMATL) allows you to establish such requirements, giving you strong controls over the materials that leave your institution.

If a specific material is part of a person's communication plan, and the individual meets all the criteria for the material, the material is generated automatically to the Student Mail Form (SUAMAIL). If a communication plan is added for a person, but the person does not meet the required criteria to receive the material, no materials are generated. When the

individual does meet the criteria, and the plan is still active, the material is generated for the person at that time.

For example, a prospect may be in the communication plan defined for undergraduate students interested in the College of Business. A specific material, such as a College Night Follow-Up Letter, may be associated with this communication plan. The material rules for this letter may require that the prospect have a contact defined as "college night". At the time the plan is assigned, the person did not have a contact of college night. However, three weeks later, the college night contact is entered. At this time, the College Night Follow-Up Letter is automatically generated on the Student Mail Form (SUAMAIL).

## Defining Materials and Rules

When materials are defined on the Material Form (SOAMATL), the user must first define specific information regarding the material in the Material information. These specifics include indicating whether the material is a published work or is generated within the system using Letter Generation. If the material is generated, a corresponding letter code must be entered. Initials and the capability of overriding initials are defined here. This section is also where the user determines whether a duplicate mailing of this material is permitted.

There are a set of rules in the Material Rules section which may be used to designate who receives certain materials. The following criteria may be used in combination to determine which materials should be created for a person: **Department, Major, Contacts, Interests, Attributes, Gender, State or Province, Ethnicity, Legacy, Citizenship, Recruit Type, Test Scores, Admission Type, Admission Decision, Student Type, Source, Application Status, ESP Code, and Region or Division.**

If a person meets the criteria defined for a specific material, and it is part of their communication plan, the system sends the individual the corresponding material. Automatic mailing of materials is based on a person's characteristics and the status of the recruiting record, admissions application, or general student record.

Material rules have an OR condition within a rule type, and rules have an AND condition among rule types. For example, in the Material Rules section, the codes which determine the rules for each field, such as the **Department** field, follow the OR condition. The codes which determine the rules for all the fields in the section, from **Department** through **Region Or Division**, follow the AND condition in relation to each other.

Suppose your institution offers scholarships to new freshmen who have scored well on either the SAT verbal or SAT mathematics tests. You should set up rules for this scholarship material or letter that indicate these requirements. To accomplish this task, you should enter in the test score rules that the person must have an SAT verbal score OR an SAT math score of 700, AND a student type of "B" (new freshman) to receive this material. Only these people with a student type of "B", and either an SAT verbal or SAT math score of 700 or better, will receive this material.

Materials are only generated for departments, majors, and general student admit codes and student types when a communication plan is added. Materials for non-majors, departments, and general student admit codes and student types are generated from the following forms:

- SAAACKL
- SAAADMS
- SAADCRV
- SAAQUIK
- SGASADD
- SGASTDN
- SLARMAP
- SOAAPPT
- SOACCOL
- SOAPLAN
- SOATEST
- SPACMNT
- SPAIDEN
- SPAPERS
- SRAQUIK
- SRARECR

### **Using Material Groups**

Once all materials have been defined, and their corresponding rules have been established, material groups may be used. Using group codes is a shorthand method of assigning a group of materials to multiple communication plans, rather than assigning each material individually to each communication plan.

Groups of materials are defined on the Communication Group Form (SOACGRP). Use this form to specify the material codes which you would like to be part of the communication group. An example of a group of materials may be Athletic Brochures. Instead of adding each athletic brochure at your institution to each communication plan, use group code processing to ease data entry. On the Communication Group Form (SOACGRP), enter the group code for Athletic Brochures in the Key Information, and add the material codes for such things as football brochures, baseball brochures, and field hockey brochures. Adding the group code to your communication plans associates each of the materials in the group with the plan. Please note that the rules for each material are

checked individually. If a person meets the rules for the football brochure, and no others in this group, they will only receive the football brochure.

## Associating Materials with Plans

After defining your institution's materials, material rules, and communication groups, you must determine which materials and groups of materials will be part of each of your institution's communication plans. Materials and communication groups are added to a plan on the Communication Plan Form (SOACPLN). Use this form to define individual materials for a plan and their associated wait days and to assign groups of materials to a communication plan. If a specific material is added for a communication plan, and that material is also part of a group of materials, the system does not generate the material twice to the Student Mail Form (SUAMAIL). It checks your plan rules and only generates one of the materials that is needed.

## Using Communication Plans

Communication plans may be automatically generated online in the Recruiting, Admissions, and General Student Modules and are controlled by the user. If a person meets the requirements to be assigned to a communication plan as defined on the Communication Rules Form (SOACOMM), the Communication Plan Change window appears, and the user is given the option to assign a communication plan, or exit from the window.

### Note

To exit from the window, you must make some change to the record (such as remove a plan and Save, change a plan and Save) or simply save the existing/assigned plans. Use the **Return** button to return to the main window of the form. ■

The following criteria, **Campus**, **Level**, **College**, **Degree**, **Field of Study Type**, **Field of Study Code** (major), and **Curricula** (*Primary, Secondary, Any*) as defined on the Communication Rules Form (SOACOMM), and the person's stage of processing, either recruit, applicant, or student (learner), determine the communication plan in which a person is placed. You can define rules that will assign a communication plan based upon any field of study type (i.e., not just major) and/or elements in the primary curriculum, secondary curricula, or all curricula.

When creating your institution's communication plan rules, be aware that any fields which are left blank are treated as wildcards. For example, if your institution has two communication plans, one for undergraduate level and one for graduate level students, you should create your rules with an undergraduate level code specified for the undergraduate communication plan. Level would be the only rule defined for the plan, so any person at that level and indicated processing stage (recruit, applicant, or student) is placed in that communication plan. The same would be true for the graduate level students.

Please note that communication plans may be set up at a broad level by using one rule, such as by level only, or they may be specific for each campus, level, college, and degree

combination. This decision should be made prior to implementing this functionality at your institution.

## Using the Communication Plan Change Window

The Communication Plan Change Window displays in the forms listed below, if an curriculum record is added or updated in the database and this causes a change of communication plan.

Recruit Prospect Information Form	(SRARECR)
Quick Recruit Form	(SRAQUIK)
Admissions Application/Checklist Summary Form	(SAAACKL)
Admissions Application Form	(SAAADMS)
Quick Entry Form	(SAAQUIK)
Admissions Decision Form	(SAADCRV)
General Student Form	(SGASTDN)
Communication Plan Collector Form	(SOACCOL)

The Communication Plan Change window for the student is automatically displayed on SAAADMS, SAAQUIK, SRAQUIK, SRARECR, and SGASTDN under the following conditions:

- A new host record (SRBRECR, SARADAP, SGBSTDN) is added along with its primary curriculum, and a communication plan matches the curriculum.
- A new curriculum or field of study is added to a host record, and a communication plan matches the curriculum and does not currently exist for the student's recruiting, application, or general student record.
- A host record is inactivated by a withdrawal or other source/background institution code (SRBRECR, SARADAP), or the student status on the general student record (SGBSTDN) is inactive.
- A host record is deleted, and communication plans exist for that record.
- A curriculum or field of study is deleted, and communication plans exist for the host record.
- A curriculum or field of study is inactivated, and communication plans exist for the host record.

The Communication Plan Change window is *not* displayed automatically from SOACCOL and SAAACKL. The user must select the Communication Plan item from the Options Menu.

The Communication Plan Change window is displayed automatically from SAADCRV if the resulting decision is to create a new general student record, or when a new curriculum is added for the student, and a new communication plan matches the curriculum.

When the Communication Plan Change Window appears in one of these forms, the user is given the option to delete, inactivate, or ignore the initial communication plan and any pending materials, and the option to add the new communication plan. This is all done by setting the checkboxes to Yes, No, Inactivate, or Delete (by checking or unchecking them) and then saving the data and acknowledging the change. If no change in plans is desired, use Save to exit from the window.

 **Note**

To exit from the window, you must make some change to the record (such as remove a plan and Save, change a plan and Save) or simply save the existing/assigned plans. Use the **Return** button to return to the main window of the form. ■

For example, when a recruiting record is first added to the database via the Recruit Prospect Information Form (SRARECR), if the prospect's campus, level, college, and degree match a communication rule on the Communication Rules Form (SOACOMM), the Communication Plan Change Window appears. The user may save this communication plan or exit from the window.

As the prospect becomes an applicant, similar steps must be taken to delete, inactivate, or continue with recruiting communication plans and the addition of admissions or general student plans. The Communication Plan Change Window will appear in the Admissions Application Form (SAAADMS) when a record is added to the database. After the admissions record is saved to the database, the system determines whether a communication plan exists, needs to be changed, or should be added for the person.

At the time the Communication Plan Change Window appears in the Admissions Application Form (SAAADMS), the user is given the option to:

1. delete, inactivate, or ignore the initial communication plan,
2. delete or ignore any pending materials from the existing communication plan, and,
3. add the new communication plan in this window.

After each of these options are selected, the changes should be saved. When communication plan changes are saved to the database, the message: *Communication Plan Update in Process...* appears. *You must acknowledge this message to continue processing the communication plan.* If no change in plans is desired, exit from the window.

 **Note**

To exit from the window, you must make some change to the record (such as remove a plan and Save, change a plan and Save) or simply save the existing/assigned plans. Use the **Return** button to return to the main window of the form. ■

The Communication Plan Change Window appears in three specific circumstances.

1. If a record for a person is added to SAAADMS, SAAQUIK, SRAQUIK, or SRARECR, and this person fits the criteria combination of a communication plan designated on the Communication Rules Form (SOACOMM), and the same active plan does not already exist for that person on the Communication Plan Assignment Form (SOAPLAN).
2. If the value for the campus, level, college, degree, field of study type, field of study code (major), or curricula (primary, secondary, any) is changed for the person on one of the above forms and that change alters the criteria for the communication plan assigned to them based on the rules designated on the Communication Rules Form (SOACOMM).
3. If a person's record is deleted and they have an active communication plan, the communication plan window will open to ask you if you would like to inactivate their communication plan.

Because of the complex curriculum validation and communication plan processing that occurs when records are saved on SAAADMS, SAAQUIK, SRAQUIK, or SRARECR, the creation of multiple records prompts you to save any changes. If you have made unsaved changes to one record, then perform a Next Record function, the box *Do you want to save the changes you have made? You must save your changes in order to proceed to the next record. Yes or No* is displayed. If you choose Yes, the changes for the record you are working on will be saved, and the necessary validation and communication plan processing will occur. If you answer No, the above message displays until you either choose to save or leave the form.

In other words, you will not be permitted to create a new record without saving changes to the one you are currently working on. This eliminates confusion over the record for which curriculum checking and communication plan processing are occurring.

### Using the Collector File

Similar steps need to be taken when an applicant becomes a student. Please note that after registration exists, changes in student information that may cause a plan change (campus, level, college, degree) *must* be made on the Student Course Registration Form (SFAREGS), and that the Communication Plan Change Window will *not* appear in this form. Instead, a collector file which can be viewed online in the Communication Plan Collector Form (SOACCOL) is updated with the changes made that cause the communication plan to change or materials to be sent. Note that any batch process which may affect a communication plan or materials to be sent to a plan member also updates this collector file. Batch processes which may cause an update to the collector file include:

Electronic Prospect Load Process	(SRTLOAD)
Admissions Decision Calculation Report	(SARBDSN)
Student Type Update	(SHRTYPE)

Records added to the Communication Plan Collector Form (SOACCOL) may be updated individually online by performing a Count Query Hits function or by using the Communication Plan item from the Options Menu. If a change is being made to a communication plan, the Communication Plan Change Window appears. If the collector record is to add materials only, no window appears after performing a Count Query Hits function; however, the materials are generated. After processing a collector record on this form, delete the record from the collector file.

The Communication Plan Processing Report (SORCPLN) allows you to process all collector records in batch. You may clean up the collector file prior to running this batch process by entering the Communication Plan Collector Form (SOACCOL) and deleting those records which you do not wish to process.

### Assigning Communication Plans

The Communication Plan Assignment Form (SOAPLAN) is used to assign or view assigned communication plans for a person. The **Module Indicator** radio group value of **Recruiting**, **Admissions**, or **Student**, indicates which module the plan is for. A communication plan follows a person through these modules and may be turned off or on as processing changes or as the plan changes according to the rules which have been defined.

A person may have multiple active plans. Multiple plans may exist within a module or across modules. For example, if your recruiting communication plan rules are set up as different plans for different campuses, and a student is a prospect for both campuses, that student may have active recruiting communication plans for both campuses.

Also, if a student is currently enrolled at your institution as an undergraduate student and has a student communication plan and is also considered a prospect for the graduate program, the student may also have an active recruiting module communication plan.

A person's communication plans are differentiated by term code and application or sequence number on the Communication Plan Assignment Form (SOAPLAN). The term code is associated with recruiting or admissions status, while the application or sequence number identifies the specific recruiting or admissions application. When the **Active (Indicator)** in the Assignment section is checked, the person will receive materials for the plan code. When the **Mail Exists (Indicator)** in the Assignment section is checked, the materials have been automatically posted to the Student Mail Form (SUAMAIL) and have been sent via Letter Generation, based on the plan code that generated the materials. Perform a Count Query Hits function from the **Plan** field in the Assignment section to create materials for a new communication plan for the person whose ID is in the Key Information.

## Implementing Communication Plans

The following validation forms, application rule/control forms, and processes are used in Communications Plan Processing:

### Validation Forms

STVMATL	Material Code Validation Form
STVCGRP	Communication Group Code Validation Form
STVCPLN	Communication Plan Code Validation Form

### Application Rule/Control Forms

SOAMATL	Material Form
SOACGRP	Communication Group Form
SOACPLN	Communication Plan Form
SOACOMM	Communication Rules Form
SOACCOL	Communication Plan Collector Form
SOAPLAN	Communication Plan Assignment Form

### Reports/Processes

SORCPLN	Communication Plan Processing Report
---------	--------------------------------------

Perform the following steps:

1. Create a communication plan by defining the materials at your institution that will be made available to each communication plan. Material codes may be up to four characters in length and are defined on the Material Code Validation Form (STVMATL).
2. After you have defined your material codes, define the base information for the material itself. This includes indicating whether the material is published or generated. If generated, you must enter the letter code.

In addition, you must define the rules which the recruit/applicant/student must meet to receive this material. Both of these tasks are performed on the Material Form (SOAMATL).

Please remember that material rules have an OR condition within a rule type, and rules have an AND condition among rule types. For example, in the Material Rules section, the codes which determine the rules for each field, such as the **Department Rules** field, follow the OR condition. The codes which determine the rules for all fields in the section, from **Department** through **Region or Division**, follow the AND condition in relation to each other.

3. Once all materials have been defined and their corresponding rules have been established, you may use material groups. Using group codes is a shorthand method of assigning the code to multiple communication plans, rather than assigning the code individually to each communication plan. The first task in using material groups is to define your group codes on the Communication Group Code Validation Form (STVCGRP).
4. After defining your group codes, you can add standard materials such as an Institutional Financial Aid Brochure, GSL Brochure, and Payment Options pamphlet to groups of materials, such as Financial Aid Materials, for communication plans. This is done using the Communication Group Form (SOACGRP).

 **Note**

Wait days may be assigned to designate when materials should be sent for a plan. By using this methodology, you need only associate the group code with your communication plans, and if the members assigned to the plan meet the criteria for any or each of the materials within the group, they are automatically sent those materials for which they qualify. This processing should ease the burden of data entry when communication plans are created at your institution. ■

5. You must define the communication plan codes which will be used at your institution on the Communication Plan Code Validation Form (STVCPLN). These codes define the communication plans to which recruits/applicants/students may be assigned at your institution.
6. Once you have defined your communication plan codes, materials, and communication groups, you need to specify which materials and groups should be part of each communication plan. This is accomplished on the Communication Plan Form (SOACPLN). This form is used to assign materials and groups of materials to a communication plan.

Groups of materials are set up, added to communication plans, and maintained at the group level. Materials assigned to a plan, which are also included in groups of materials assigned to a plan, are not duplicated when mailed. Wait days may be assigned to designate when materials should be sent for a plan.

7. Now that you have fully defined the communication plans to be used at your institution, you must specify the rules which a recruit/applicant/student must meet in order to become assigned to a communication plan. You define rules by **Campus**, **Level**, **College**, **Degree**, **Field of Study Type**, **Field of Study Code** (major), and **Curricula** (*Primary, Secondary, Any*), on the Communication Rules Form (SOACOMM). These criteria, as well as the person's stage of processing in the Recruiting, Admissions, or General Student modules determine which plan a person is placed in. Any fields which are left blank are treated as wildcards. The form is

also used to calculate the communication plan to which a person is assigned when a record is added or updated in the database.

 **Note**

If a recruiting level is not defined during the Electronic Prospect Load Process (SRTLOAD), the default value of level 00 will be assigned to each of the added recruiting records. If you choose to use this default level value and intend to use communication plan processing, you need to create communication plan rules for the 00 level on the Communication Plan Rules Form (SOACOMM). Otherwise, your newly created recruits will not be assigned to a communication plan. It is also important to note that the default level value of 00 is also used when initially creating recruiting records on the Recruit Prospect Information Form (SRARECR) and the Quick Recruit Form (SRAQUIK). ■

8. Normal processing should now be performed in all modules. Please note that the Communication Plan Change Window appears during normal processing in the following forms if a data element (**Campus, Level, College, Degree, Field of Study Type, Field of Study Code** (major), and **Curricula** (*Primary, Secondary, Any*)) is added or changed for a person:

Recruit Prospect Information Form	(SRARECR)
Quick Recruit Form	(SRAQUIK)
Admissions Application/Checklist Summary Form	(SAAACKL)
Admissions Application Form	(SAAADMS)
Quick Entry Form	(SAAQUIK)
Admissions Decision Form	(SAADCRV)
General Student Form	(SGASTDN)
Communication Plan Collector Form	(SOACCOL)

For example, when a recruiting record is added online in the Recruit Prospect Information Form (SRARECR) or the Quick Recruit Form (SRAQUIK), the system automatically checks to determine if the prospect qualifies for placement in a communication plan according to their campus, level, degree, college, field of study type, field of study code (major), curricula (primary, secondary, any, and the rules your institution has established on the Communication Rules Form (SOACOMM)). If the prospect does qualify for a communication plan, the Communication Plan Change Window displays.

At this time you will be given the option to (1) delete, inactivate, or exit the initial communication plan, (2) delete any pending materials from the existing communication plan or leave them as they are, and (3) add the new communication plan in this window. If the option selected causes changes in a plan, the changes need to be saved. When communication plan changes are saved to the database, the message: *Communication Plan Update in Process...* appears. You must acknowledge

this message in order to continue processing the communication plan. If no change in plans is desired, you may exit from this window.

 **Note**

To exit from the window, you must make some change to the record (such as remove a plan and Save, change a plan and Save) or simply save the existing/assigned plans. Use the **Return** button to return to the main window of the form. ■

As the prospect moves to applicant status, you must take similar steps to delete, inactivate, or continue with recruiting communication plans, and to add the admissions plans. The same is true when an applicant becomes a student.

If you perform a Save function from the Communication Plan Change Window, you are given the message *Communication Plan Update in Process...* which you must acknowledge, before the plan is added for the recruit. If you choose the Exit function, the communication plan window disappears, and no communication plan is assigned.

9. After registration exists, 1) changes in student information that may cause a plan change (campus, level, college, degree) *must* be made on the Student Course Registration Form (SFAREGS), and 2) the Communication Plan Change Window will *not* appear in this form. Instead, a collector file which can be viewed and processed individually online in the Communication Plan Collector Form (SOACCOL) is updated with the changes made that cause the communication plan change or materials to be sent. In order to process these changes in batch, the Communication Plan Processing Report (SORCPLN) must be run to update communication plans according to the entered parameters.

 **Note**

Any batch process which may affect a communication plan or materials to be sent to a plan member updates this collector file on SOACCOL. Those collector records may be updated individually online or in batch via the Communication Plan Processing Report (SORCPLN). ■

Communication plan information updates the batch collector file when you run the Electronic Prospect Load Process (SRTLOAD), the Student Type Update Report (SHRTYPE), the Admission Decision Calculation Report (SARBDSN), or when you make changes to the general student information after registration information exists.

Use the Communication Plan Collector Form (SOACCOL) to display the people which have been added to the collector file for batch processing for communication plans. The Communication Plan Processing Report (SORCPLN) updates these changes for communication plans in the collector file. The changes may be updated online by the performance of a Count Query Hits function from the record you want to update.

10. Use the Communication Plan Assignment Form (SOAPLAN) to assign or view assigned communication plans for a person. The **Module Indicator** radio group value of **Recruiting**, **Admissions**, or **Student**, indicates which module the plan is associated with. A communication plan follows a person through these modules and

may be turned off or on online as processing changes or as the plan changes, according to the rules which have been defined. A person may have multiple communication plans assigned to them which are differentiated by term code and application or sequence number. The term code is associated with recruiting or admissions status, while the application or sequence number identifies the specific recruiting or admissions application.

When the **Active (Indicator)** in the Assignment section is checked, the person will receive materials for the plan code. When the **Mail Exists (Indicator)** in the Assignment section is checked, the materials have been automatically posted to the Student Mail Form (SUAMAIL) and have been sent via Letter Generation, based on the plan code that generated the materials. Materials may be sent manually once a plan is assigned to a person, materials are created, and the rules for the materials meet the criteria for addition to SUAMAIL.

When a Count Query Hits function is performed from the **Plan** field in the Assignment section, materials are created for a new communication plan for the person whose ID is in the Key Information.

## Electronic Prospects Processing

### Overview

Electronic Prospects processing provides a Web data entry point into the existing electronic prospects search tape and test score tape load functionality and allows for recruit information to be available in the Banner Student Self-Service module called Web for Prospects.

Please refer to the *Banner Student Self-Service User Guide* for more information on the Web for Prospects module. Please refer to the “Search and Test Score Tape Load” section which follows “Electronic Prospects Processing” for more procedural information.

The following forms are used to support the electronic prospects functionality:

- Web Prospect How I Learned About Validation Form (STVLEND)
- Electronic Prospect Validation Form (STVPREL)
- Web Acknowledgement Validation Form (STVWACK)
- Web Prospect Information Selection Validation Form (STVWPIC)
- Electronic Prospects Default Options Form (SRAPRED)
- Electronic Prospect Detail Form (SRAPREL)
- Recruit Prospect Information Form (SRARECR)
- Web for Prospects Acknowledgement Letter Form (SRAWACK)

- Web for Prospects Display Rules Form (SRAWPDS)
- Web for Prospects Selection Rules Form (SRAWPRO)

## Processing Steps

Use these steps to set up the Web for Prospects Web page entry:

1. Enter your Web prospect type code on the Electronic Prospect Validation Form (STVPREL). (Required)
2. Identify the data entry sections to be displayed on the Web page on the Web for Prospects Selection Rules Form (SRAWPRO). (Required)

### Warning

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Response Required on Web** checkbox on SRAWPRO for the *ETHNICITY* (Prospect Ethnicity/Race) Web prospect selection code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web selection definitions and uncheck this checkbox for any selections for which it is currently checked. ■

3. Enter default recruiting data on the Electronic Prospects Default Options Form (SRAPRED). (Optional)
4. Select Banner validation items to appear in the Web lists on the Web for Prospects Display Rules Form (SRAWPDS). (Optional)
5. Write your acknowledgment letter on the Web for Prospects Acknowledgment Letter Form (SRAWACK). The letter is constructed dynamically and appears at the end of the Web data entry. (Optional)

## Web Prospect How I Learned About Validation Form (STVLEND)

This form is used to build Web for Prospects How I Learned About codes to designate how the prospect learned about the school. These codes are entered by prospects on the Web for Prospects Web entry forms. The data is migrated to the Banner production Recruiting module and is available on the Recruit Prospect Information Form (SRARECR).

## Electronic Prospect Validation Form (STVPREL)

This form is used to enter the electronic prospect type codes. The **Enter on WEB** and **WEB Page ID** fields are used to support Web for Prospects.

The prospect codes that do not have the **Enter on WEB** checkbox checked cannot be entered on the Web. The **WEB Page ID** field is used for grouping prospects on a Web page. For example, if your institution has several undergraduate programs, you may have different default values and require that different data be entered. Therefore, you would create separate prospect codes. You can key the selection of your undergraduate programs off one site by constructing a link using the **WEB Page ID** value.

## Web Acknowledgement Validation Form (STVWACK)

This form is used to build Web for Prospects Acknowledgement codes for data elements from the Electronic Prospect System. The values delivered with Web for Prospects are system-required. These codes are used on the Web for Prospects Acknowledgement Letter Form (SRAWACK) for placing Electronic Prospect data elements on the Web acknowledgment letter. The acknowledgment letter appears on the Web after the prospect presses the **Submit** button.

## Web Prospect Information Selection Validation Form (STVWPIC)

This form is used to build Web for Prospects Information Selection codes for Web data entry sections. The values delivered with Web for Prospects are system-required. These codes are entered on the Web for Prospects Selection Rules Form (SRAWPRO) to control order and data entry requirements for the Web for Prospects Web entry forms.

### **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Response Required on Web** checkbox on SRAWPRO for the *ETHNICITY* (Prospect Ethnicity/Race) Web prospect selection code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web selection definitions and uncheck this checkbox for any selections for which it is currently checked. ■

## Electronic Prospects Default Options Form (SRAPRED)

This form is used to enter the default recruit values for Web-entered data.

Enter a code from STVPREL in the **Electronic Prospect Code** field in the key, and use Next Block to see the default values for the prospect code. The prospect codes on STVPREL must have the **Enter on WEB** checkbox checked in order to be displayed in the list of values for the **Electronic Prospect Code** field on SRAPRED.

The **Clear Defaults** button is used to remove the existing values so new ones can be entered for the code in the key.

This form is optional for use in Web for Prospects processing. The **Level**, **Recruiting Term**, **Degree**, and **Major** are required in the Recruiting module. If those values are not entered here, and this data is not entered on the Web, the Banner system-required values will default into the recruiting records.

If you do enter data on this form, the **Level** field is required.

## Web for Prospects Acknowledgement Letter Form (SRAWACK)

This form allows you to customize the acknowledgment letter. The acknowledgment letter will appear on the Web page after the student presses the **Submit** button.

Enter a code from STVPREL in the **Web Electronic Prospect Code** field in the key, and use Next Block to see the sequence numbers and variables for the letter. The prospect codes on STVPREL must have the **Enter on WEB** checkbox checked in order to be displayed in the list of values for the **Web Electronic Prospect Code** field on SRAWACK.

The **Sequence** field determines the order of the rows in the letter. When you first type in your letter, you can leave the sequence number blank, and the sequence will automatically fill in when you save the letter. Or, you can type in a sequence number incrementing each line by five, just in case you need to add new lines at a later time.

The **Formatting** field is a pulldown list where you can select an HTML command. The values for the field are blank, New Paragraph, New Line, or Horizontal Rule. The only time the formatting is ignored is when the **Text** and the **Prospect Data** fields are blank. This prevents blank lines from appearing in the middle of your letter.

The **Prospect Data** field is used for data elements from the Electronic Prospect System. These variables are stored on the Web Acknowledgement Validation Form (STVWACK).

The **Text** field is a free format field where you can include HTML commands in the text for additional formatting. Use the **Comments** button to display the Editor window and enter your text.

## Web for Prospects Display Rules Form (SRAWPDS)

This form allows you to reduce the number of choices the student can select from or to change the descriptions that will display on the Web.

This is accomplished by customizing the pulldown lists with specific values from Banner validation tables. All list boxes in the Web for Prospects Web pages are populated from Banner validation tables.

Enter a code from STVPREL in the **Web Electronic Prospect Code** field in the key, and use Next Block to see the table names and rules used with the prospect code. The prospect

codes on STVPREL must have the **Enter on WEB** checkbox checked in order to be displayed in the list of values for the **Web Electronic Prospect Code** field on SRAWPDS.

You may enter the last four characters of a validation table name in the **Validation Table Name** field in the key to see only the rules for that validation table and the prospect code, or leave the **Validation Table Name** blank to view all the rules for the prospect code. For example, enter *TERM* for STVTERM, *CITZ* for STVCITZ, and *RESD* for STVRESD.

Enter the validation code value in the **Code Value** field. The description from the validation table will default, but you can type over the description in order to customize it.

The student will never see codes on the Web for Prospects Web page. They will only see descriptions. If you do not enter data on this form, all entries in the Banner 2000 validation table will be listed.

### High School and Prior College Lists

The Web for Prospects Web page allows you to search for a high school or prior college. The search process will first prompt the student to select the state, province, or nation from pulldown lists. The student is next prompted to select the name of the city where the school is located. The last selection is for the school itself.

The requirement for this search is that address data be present for the schools included in the search. School addresses are maintained on the Source or Background Institution Base Form (SOASBGI).

The High School entry section has an alternative checkbox where the student can indicate he or she was home schooled. The STVSBGI value for the Home School must be stored on the SAAERUL rule for *HOMESCHOOL*.

If the student cannot find his or her school in the selection, yet he or she enters the name of the school, or any of the self reported data (including GPA, graduation date, rank, or class size), the school code will default in the value on the SAAERUL rule for *UNKNOWNHSCH*. If the student enters a school code that is not included in your STVSBGI table, that value will still be stored in the SRTHSCH or SRTPCOL table in the SBGI\_CODE\_INVALID column.

### Web for Prospects Selection Rules Form (SRAWPRO)

This form is used to identify the selections for display on the Web and the order in which they display .

Enter a code from STVPREL in the **Web Electronic Prospect Code** field in the key, and use Next Block to see the selection codes used with the prospect code. The prospect codes on STVPREL must have the **Enter on WEB** checkbox checked in order to be displayed in the list of values for the **Web Electronic Prospect Code** field on SRAWPRO.

The values in the **Selection Code** field are created on the Web Prospect Information Selection Validation Form (STVWPIC) and are system-required. Each selection is equated to data elements in the Web for Prospects module of the Banner Student Self-Service product.

Use the **Address Code** and **EMAIL (Code)** fields to enter the values to be used. These values are required for the selection codes *ADDRESS1*, *ADDRESS2*, and *EMAIL*.

The **Display Order on Web** field is used to designate the order of the modules on the Web page that fits your requirements.

The **Response Required on Web** checkbox, when checked, is used to force the prospect to enter data on the Web page.

### **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Response Required on Web** checkbox on SRAWPRO for the *ETHNICITY* (Prospect Ethnicity/Race) Web prospect selection code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web selection definitions and uncheck this checkbox for any selections for which it is currently checked. ■

When you first enter this form with a new prospect code from STVPREL, the selection codes for *NAME* and *ADDRESS1* will automatically default.

If you have not entered any selection codes on this form for a prospect code from STVPREL, the prospect code will not be available on any Web page in Web for Prospects.

## Electronic Prospect Detail Form (SRAPREL)

This form is used to view biographical and search or test score tape data for a person that has been loaded to the temporary tables. The form allows you to view all search tape records for this ID which are present in the Search Tape View (SRVPREL). This form is accessed independently or from the Electronic Prospect Inquiry Form (SRIPREL) using the Detail item in the Options Menu.

### **Test Scores/Interests/Learned Window**

Use this window to view test score and interest information for the record, as well as how the person learned about the school. Use the Test Scores/Interests item in the Options Menu of the main window to access this window.

The **(Learned About Institution) Code** in the (How I) Learned block is used by Web for Prospects to capture how the person learned about the school. The data is initially stored

in Web for Prospects and is viewable from SRAPREL. After the prospect has been migrated to Banner Production, the data is available on SRARECR.

The How I Learned data is migrated to the recruit record based on the rule value *CREATELEARNED*, which is stored on SAAERUL under the group *PREL*. If the *CREATELEARNED* rule is *Y*, the prospect How I Learned data is migrated to the recruit How I Learned data.

The **(Learned About Institution) Code** is validated on the Web Prospect How I Learned About Validation Form (STVLEND).

### Requested Materials Window

The Requested Materials window is used to compliment the collection of that data for prospects in the Web for Prospects module of Banner Student Self-Service. This window is used to list the materials requested by the student. The SRTMATL table is used to store the materials collected on the Web.

The SRKPREL package is used to migrate SRTMATL data to GURMAIL in Banner production. The materials will not be migrated to GURMAIL if they fail the duplicate checking rules. A material is a duplicate if an existing GURMAIL row exists for the same material and has a blank print date, or the GURMAIL row exists for the same material with a non-blank print date, but the Allow Duplicate Entry rule on SOAMATL is not checked.

Use the rule on the Electronic Admissions Application Rules Form (SAAERUL) where the **Group (Code)** is *PREL* and the **Label** is *CREATEMATERIALS*.

### Recruit Prospect Information Form (SRARECR)

This form provides the information necessary for all recruitment-related activities, captures and validates information on prospective applicants, and in the Comments/Learned window contains information for electronic prospect processing on how the person learned about the school.

### Comments/Learned Window

Use this window to enter comments about the prospect and to view information on how the person learned about the school. This window is accessed using the Comments, Learned item in the Options Menu.

The **(How I) Learned (About Institution Code)** in the (How I) Learned block is used by Web for Prospects to capture how the person learned about the school. The data is initially stored in Web for Prospects and is viewable from SRAPREL. After the prospect has been migrated to Banner Production, the data is available on SRARECR.

The How I Learned data is migrated to the recruit record based on the rule value *CREATELEARNED*, which is stored on SAAERUL under the group *PREL*. If the

*CREATELEARNED* rule is *Y*, the prospect How I Learned data is migrated to the recruit How I Learned data.

The **(How I) Learned (About Institution Code)** is validated on the Web Prospect How I Learned About Validation Form (STVLEND).

## Electronic Admissions Application Rules Form (SAAERUL)

This form is used to define the rules which are used when processing electronic applications, electronic prospects, and tape loads. Rows for this table are not intended to be added locally. Rules which will be used in system processing will be delivered by SunGard® Higher Education, and users will only need to update the **(Rule) Value** to reflect local processing options if it contains *UPDATE ME*.

Rules fall into three major categories:

- Rules which control processing within Web admissions, Web prospects, or tape load processing.

For example, there is a rule which specifies the number of outside interest slots which will display in Web applications.

- Rules which specify default values for various data elements. These kinds of rules can apply to both Web and EDI applications.

- Rules which govern how data will be loaded into the permanent Banner tables.

For example, there is a set of rules which specifies whether application records will be created if one already exists for the person, term, level, major, or overall curriculum chosen.

Three general types of values may be required in the **(Rule) Value** field, and the **Rule Description** field will usually indicate the type of value expected.

- Simple descriptive answers, like true, false, or a number to indicate the number of values which will be available.
- A valid Banner validation table code, like an address type code.
- An EDI value which is valid within the TS189 transaction set. A complete, current listing of all codes used in the TS189 transaction set is available online.

For a complete current set of EDI values, you can consult the Postsecondary Electronic Standards Council (PESC) Website ([www.pesc.org](http://www.pesc.org)) and use the link to the EDI Implementation Guides.

(When a valid EDI value is expected, the **EDI Indicator** for the rule will be checked or *Y*).

Use the **Copy PREL Group** button to copy existing electronic prospect rules to a new group code. Once the values have been copied, the **System Required Indicator** defaults to *N* or unchecked, so you can customize the group settings. This allows users to

customize the electronic prospect rules based on each electronic prospect code used, instead of the same set of values applying to all electronic prospect codes.

For example, if an electronic prospect code of *SAT* exists and you want it to be processed differently based on the rules for a group code of *PREL* on *SAAERUL*, then do the following.

1. Define a new group code on the EDI Rule Group Validation Form (STVEGRP) for *SAT*. (The new group code must match the electronic prospect code).
2. Enter *SAT* in the **Group** field on *SAAERUL*.
3. Select the **Copy PREL Group** button. All of the rules that exist for the *PREL* group code will be copied to your new *SAT* group code.
4. You can customize those values, and they will be applied only when the electronic prospect code used on *SRTLOAD*, *SRRSRIN*, or *SRRPREL* is *SAT*.

## Rules on *SAAERUL*

The rules on the Electronic Admissions Application Rules Form (*SAAERUL*) with the **Group (Code)** *PREL* allow you to set up default values for such things as an unknown high school and to control the migration of the data.

### New Recruit Data

Rules are used for determining under what circumstances recruiting records, addresses, and phone numbers will be loaded. For the rule label *CREATENEWRECR* (no recruit exists, create new recruit), the possible values are *Y* or *N*. When an incoming record is being loaded and matched to an existing Banner person, the code will check if a recruiting record already exists for the person. If none does, then the code will check the *CREATENEWRECR* rule. If the rule value is *Y*, then the incoming data will be used to create a recruiting record. If the rule value is *N*, then no recruiting record will be created.

The two other rules used for creating a recruiting record are *MCREATENEWRECR* (matching recruit exists, create new recruit) and *NMCREATENEWRECR* (non-matching recruit exists, create new recruit).

- The possible values for *MCREATENEWRECR* are *Y*, *N*, or *U* (Update). If an incoming record is being loaded, the program will determine if a matching recruiting record already exists. An existing recruiting record matches if it has the same term, level, and optionally campus.
  - If the incoming record matches the existing recruiting record, and the *MCREATENEWRECR* rule value is *Y*, then a new recruiting record will be created.
  - If the *MCREATENEWRECR* rule value is *U*, then no new recruiting record will be created, and instead, the existing recruiting record will be updated. If

a matching recruiting record exists, and the incoming contact, source, and/or interests are different, those values are updated.

- If the *MCREATENEWRECR* rule value is *N*, then no recruiting record will be added, and the existing recruit record will not be updated.
- The possible values for *NMCREATENEWRECR* are *Y* or *N*. If an incoming record is being loaded, and it does not match to an existing recruiting record (based on term, level, and optionally campus), then the code will check the *NMCREATENEWRECR* rule to determine whether or not to create a new recruiting record.

## New Address Data

The rule label *NEWADDRESS* (no address exists, create one) is used when no address currently exists for the person in Banner. The possible values are *Y* or *N*. If the rule value is set to *Y* and no address currently exists for the person, the incoming address will be loaded.

The two other rules used for creating an address record are *ADDRDIFFTYPE* (address exists with different address type, add address) and *ADDRSAMETYPE* (address exists with same address type, add address). The possible values for these rules are *Y* or *N*.

- If an address already exists in Banner, and the incoming address record has the same address type, the address record will be inserted if the *ADDRSAMETYPE* rule value is *Y*.
- If the incoming address record has an address type that differs from the existing Banner address record, and the *ADDRDIFFTYPE* rule value is *Y*, then the incoming address record will be loaded. If the *ADDRDIFFTYPE* rule value is *N*, it will not be loaded.

## New Phone Data

The rule label *NEWPHONE* (no phone exists, create one) is used when no phone number currently exists for the person in Banner. The possible values are *Y* or *N*, where *Y* creates a new phone number, and *N* does not create a new phone number.

The two other rules used for creating a phone record are *PHONDIFFTYPE* (phone number exists with different phone type, add phone) and *PHONSAMETYPE* (phone number exists with same phone type, add phone). The possible values for these rules are *Y* or *N*.

- If a telephone record already exists in Banner, and the incoming telephone record has the same phone type, the phone number will be inserted if the *PHONSAMETYPE* rule value is *Y*.
- If the incoming phone record has a phone type that differs from the existing Banner phone type, and the *PHONDIFFTYPE* rule value is *Y*, then the incoming phone number will be loaded. If the value is *N*, it will not be loaded.

## Web for Prospects Phone and Address Data

Web for Prospects allows users to enter extra phone numbers in Banner Student Self-Service that are not associated with a specific address. If extra phone numbers are entered by prospects on the Web, they will be processed in conjunction with address/phone data as follows:

1. The primary address (Address 1) is loaded to Banner along with its associated phone number using the electronic prospect rules identified above.
2. The secondary address (Address 2), if it exists, is loaded to Banner along with its associated phone number using the electronic prospect rules identified above.
3. The extra phone numbers entered are processed one at a time, based on the alphabetical order of the telephone type, using the electronic prospect rules identified above.

For example:

- *NEWPHONE* = *Y*
- *NEWADDRESS* = *Y*
- *PHONSAMETYPE* = *N*
- *PHONDIFFTYPE* = *Y*

The person being loaded is new to Banner and has entered a mailing address and phone number. In addition, they have entered a separate “mailing” phone number and a “business” phone number. When the record is processed, the mailing address and phone number will be loaded, because the *NEWADDRESS* and *NEWPHONE* rules are both set to *Y*.

Next, the business phone number will be processed, because it falls first alphabetically based on the phone type. The business phone number will be loaded, because it is a different type than the already processed mailing phone number, and the *PHONDIFFTYPE* rule is set to *Y*. The mailing phone number will then be processed. It will also be loaded to Banner, because it is a different type than one of the existing Banner phone numbers (the business phone that was just processed), and the *PHONDIFFTYPE* rule is set to *Y*.

## List of Rules

The rules on the Electronic Admissions Application Rules Form (SAAERUL) with the **Group (Code)** of *PREL* allow you to control how the incoming data is processed. Please see the table of rules that follows.

### Note

Rows for this table are not intended to be added locally. Rules which will be used in system processing will be delivered by SunGard Higher

Education, and users will only need to update the **(Rule) Value** on SAAERUL to reflect local processing options. ■

Please refer to the “Loading Packages/Procedures from Temporary to Production Tables (SRKPREL) Process Flows” section of the “Process Flows” chapter to review process flows describing how recruiting data is loaded and updated.

Group	Label	Description	EDI	Instructions
DISP	WEBPTESTDISP	# of Prospects Test Rows	N	Determines the number of test score rows that will display on the Web for Prospects Web page.
PREL	ACTADMR	Default ADMR code for ACT	N	Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).  This default is only used for ACT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESS) for ACT test code record types.
PREL	ADDRDIFFTYPE	Create address if different type	N	Determines if an address should be created, if one with a different address type already exists. If set to <i>Y</i> , an address record will be created. If set to <i>N</i> , no address record will be created.
PREL	ADDRSAMETYPE	Create address if same type	N	Determines if an address should be created, if one with the same address type already exists. If set to <i>Y</i> , a new address record will be created. If set to <i>N</i> , no address record will be created.
PREL	COMMPLAN	Create commplan collector entry	N	If set to <i>Y</i> , a record will be inserted into the Communication Plan Collector Table (SORCCOL) which is visible on the Communication Plan Collector Form (SOACCOL).

Group	Label	Description	EDI	Instructions
PREL	CREATECONT	Create new contact if recruit or app.	N	<p>If set to <i>Y</i>, the contact code entered as a parameter on the SRTLOAD process for tape load or the contact code listed on the Electronic Prospects Default Options Form (SRAPRED) for electronic prospects will be inserted into the SORCONT table viewable on the Recruit Prospect Information Form (SRARECR) if a recruit record exists and the Admissions Application Form (SAAADMS) if an application record exists.</p> <p>If no contact code was loaded via SRTLOAD, and this parameter is <i>Y</i>, the system will insert the contact code for the appropriate interface code from the Interface Code Validation Form (STVINFC). The appropriate contact code will be loaded each time the recruit is loaded to Banner.</p> <p>If set to <i>N</i>, a contact code will not be created for new recruit records.</p>
PREL	CREATELEARNED	Create learned: Enter Y or N	N	<p>If <i>Y</i> is entered, and if the prospect is new to Banner, or if the prospect is matched to a recruit, and the recruit term, level, and campus are different, then the How I Learned data is created. The learned information will always be created if the prospect is matched to an applicant and the <i>UPDATEIIFAPP</i> is <i>Y</i>, or if the prospect is matched to a recruit with same term, level, and campus. The learned data is entered only on the Web.</p>

Group	Label	Description	EDI	Instructions
PREL	CREATEMATERIALS	Create Materials: Enter Y or N	N	If <i>Y</i> is entered, and if the prospect is new to Banner, or if the prospect is matched to a recruit, and the recruit term, level, and campus are different, then the materials data are created. The materials will always be created if the prospect is matched to an applicant and the <i>UPDATEIIFAPP</i> is <i>Y</i> , or if the prospect is matched to a recruit with same term, level, and campus.
PREL	CREATENEWAPPL	Create New Application	N	Allows schools to indicate that they want an application record created at the same time a recruit record is created by <i>SRRPREL</i> .  <b>Note:</b> When this rule is <i>Y</i> , a new application will only be created when the term, level, college, degree, department, and/or major do not match an existing application.
PREL	CREATENEWRECR	Create new recruit	Y	If set to <i>Y</i> and no recruit record exists, a new recruit record will be created. If set to <i>N</i> and no recruit record already exists, then a new recruit record will not be created.
PREL	CREATESRCE	Create new source	Y	If set to <i>Y</i> , the source code entered as a parameter on the <i>SRTLOAD</i> process for tape load or the source code listed on the Electronic Prospects Default Options Form ( <i>SRAPRED</i> ) for electronic prospects will be inserted into the <i>SRRRSRC</i> table viewable on the Recruit Prospect Information Form ( <i>SRARECR</i> ). If no source code was loaded via <i>SRTLOAD</i> , and this parameter is <i>Y</i> , the system will insert the source code for this from the Interface Code Validation Form ( <i>STVINFC</i> ).

Group	Label	Description	EDI	Instructions
PREL	GMATADMR	Default ADMR code for GMAT	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for GMAT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESC) for GMAT test code record types.</p>
PREL	GREADMR	Default ADMR code for GRE	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for GRE tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESC) for GRE test code record types.</p>
PREL	HOMESCHOOL	SBGI code, if the prospect checks the <b>Home School</b> checkbox on Web for Prospects Web page	N	<p>This applies only to the Web. The value entered on SAAERUL for this must be a valid high school on STVSBGI.</p>
PREL	HSCHADMR	Default High School Checklist	N	<p>This value will be used to populate the <b>Admissions Request</b> field on the High School Information Form (SOAHSCH). This default is <i>only</i> used when the Admissions Request value is not populated on the Source/Background Institution Code Validation Form (STVSBGI).</p>

Group	Label	Description	EDI	Instructions
PREL	HSCHSELFREPORT	Update self-reported items	N	If set to <i>Y</i> , then the student self-reported items, such as GPA, class rank, etc., will be loaded to the appropriate tables.
PREL	INTERESTMAX	Maximum interest to load	1	Indicates the number of interests to be loaded from a search tape to the SORINTS table if the <i>LOADINTEREST</i> group label is set to <i>Y</i> .
PREL	LOADINTEREST	Load interests	N	If set to <i>Y</i> , interests provided on the tape will be loaded to the SORINTS table. All interest codes must have Banner conversion values defined on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of INTS.
PREL	LOADMAJOR	Use provided major	N	If set to <i>Y</i> , majors provided on the tape will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR) and to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR). All tape major codes must have Banner conversion values defined on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of MAJR.
PREL	LOADOLDTESTS	Load older test scores	N	If set to <i>Y</i> , test score records with test dates older than the current record's scores will also be loaded.
PREL	MAJOR2INTEREST	Load major to interests	N	If set to <i>Y</i> , and <i>LOADINTEREST</i> is set to <i>Y</i> , major codes provided on the tape will be loaded to the SOTINTS table. All tape major codes must have Banner conversion values set appropriately on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of INTS.

Group	Label	Description	EDI	Instructions
PREL	MCREATENEWRECR	Matching create new recruit	N	<p>If set to <i>Y</i>, and the incoming record matches an existing recruiting record, then a new recruiting record is created.</p> <p>If set to <i>U</i>, and the incoming record matches an existing recruiting record, then no recruiting record is created, and the existing record is updated. If a matching recruiting record exists, and the incoming contact, source, and/or interests are different, those values are updated.</p> <p>If set to <i>N</i>, and the incoming record matches an existing recruiting record, then no recruiting record is created, and no records are updated.</p> <p>A match exists if the incoming record has the same term, level, and optionally campus as the existing recruiting record.</p>
PREL	NEWADDRESS	Create address	Y	<p>If set to <i>Y</i>, and no address record exists for the person in Banner, an address record will be created. If set to <i>N</i>, and no address record exists, no record will be created.</p>
PREL	NEWPHONE	Create phone	Y	<p>If set to <i>Y</i>, and no phone record exists for the person in Banner, a phone record will be created. If set to <i>N</i>, and no phone record exists, no record will be created.</p>
PREL	NMCREATENEWRECR	Non-match create new recruit	N	<p>If set to <i>Y</i>, and the incoming record does not match an existing recruit record, a new recruiting record is created. If set to <i>N</i>, no recruiting record is created.</p> <p>A match exists if the incoming record has the same term, level, and optionally campus as the existing recruiting record.</p>

Group	Label	Description	EDI	Instructions
PREL	PCOLADMR	Default Prior College Checklist	N	This value will be used to populate the <b>Admissions Request</b> field on the Prior College Form (SOAPCOL). This default is <i>only</i> used when the Admissions Request value is not populated on the Source/Background Institution Code Validation Form (STVSBGI).
PREL	PHONDIFFTYPE	Create phone if different type exists	N	Determines if a phone record should be created, if one with a different phone type already exists. If set to <i>Y</i> , a phone record will be created. If set to <i>N</i> , no phone record will be created.
PREL	PHONSAMETYPE	Create phone if same type exists	N	Determines if a phone record should be created, if one with the same phone type already exists. If set to <i>Y</i> , a new phone record will be created. If set to <i>N</i> , no phone record will be created.
PREL	PRIMESRCE	Create source as primary	N	If set to <i>Y</i> , and <i>CREATESRCE</i> is set to <i>Y</i> , then the source code loaded to the SRRRSRC table will be set as the primary source. Only one source will be flagged as primary for each recruit term and sequence number upon loading to Banner.

Group	Label	Description	EDI	Instructions
PREL	PSATMAJOR	Load the PSAT Major First	N	<p>Loads the PSAT major if it exists on tape. This rule is only used for SSS_SEARCH tape processing.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>Y</i>, and the PSAT exists on tape, the PSAT major will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR). The first SAT major code listed on tape will then be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR) if it exists.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>N</i>, the PSAT major will not load at all, and the first two SAT major codes on tape will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR) and a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR), if they exist on the tape.</p> <p><b>Note:</b> Whatever your settings are in SAAERUL, if the second major to be loaded translates to 0000 (undeclared), the second major will not be loaded.</p>

Group	Label	Description	EDI	Instructions
PREL	SATADMR	Default ADMR code for SAT	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for SAT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTEC) for SAT test code record types.</p>
PREL	UNKNOWNHSCH	SBGI code, if the student enters an invalid SBGI code on the Web	N	<p>This source/background institution (SBGI) code will fill in the SRTHSCH_SBGI_CODE, and the code the student entered will fill into SRTHSCH_SBGI_CODE_INVALID. This code is also used if student leaves the SBGI code blank but enters a name of the institution or any of the self-reported data. This rule is for the Web only. The value entered on SAAERUL for this must be a valid high school on STVSBGI.</p>
PREL	UNKNOWNPCOL	SBGI code, if the student enters an invalid SBGI code on the Web	N	<p>This source/background institution (SBGI) code will fill in the SRTPCOL_SBGI_CODE, and the code the student entered will fill into SRTPCOL_SBGI_CODE_INVALID. This code is also used if student leaves the SBGI code blank but enters a name of the institution or any of the self-reported data. This rule is for the Web only. The value entered on SAAERUL for this must be a valid college on STVSBGI.</p>

Group	Label	Description	EDI	Instructions
PREL	UPDATEIFAPP	Update recruit record if application exists	N	<p>If set to <i>Y</i>, then the settings of the previous rules will be followed, even if a recruit record already exists for this person for the same term, level, and campus. If set to <i>N</i>, and a matching recruit record already exists, then based on your SAAERUL settings, the process will:</p> <ul style="list-style-type: none"> <li>• Insert new test score records on the Test Score Information Form (SOATEST).</li> <li>• Insert new high school records on the High School Information Form (SOAHSCH).</li> <li>• Insert new college records on the Prior College Form (SOAPCOL).</li> <li>• Insert the contact code into the SORCONT table.</li> <li>• Insert the source code into the SRRRSRC table if a matching recruit record exists or insert the source code into the SARRSRC table if a matching application record exists.</li> <li>• Update null values on the General Person Form (SPAPERS).</li> </ul>
PREL	VTYPADMR	Default ADMR Code for the Visa	Y	<p>Identifies the Checklist Summary Request Code for the Visa Code value to be inserted on the Admissions Application Detail block of the Admissions Application Form (SAAADMS) when loading a record from the Banner Student Self-Service Prospects (Recruiting) or Admissions modules. This rule is <i>only</i> used by the Web interface.</p>
PREL	WEBGENID	For Web only, use generated ID, or use entered SSN for ID	N	<p>Enter <i>G</i> to always use the generated ID which uses SOBSEQN functions. Enter <i>S</i> to use the SSN entered on the Web. If neither is entered, use a generated ID.</p>

# Tape Load and Match Processing

## Overview of Banner Student External Load and Match Process

The following steps include technical details of the tape load process for the student test score tapes, search tapes, electronic prospects, and electronic applicants. This discussion is intended to provide information on how the process works from a technical perspective.

For additional information on Common Matching, please refer to the *Banner General User Guide* and the “Common Matching Processing” procedures in the “General Person” chapter of this user guide.

## External Load Processes

External data is loaded into various sets of temporary tables depending on the source of the external data. Test score data such as SATs, GREs, AMCAS, etc., is loaded into temporary tables beginning with SRT, as is search tape data and Banner Student Self-Service prospect data. If you are using the Electronic Prospect Match Process (SRRSRIN), the test score data is loaded into temporary tables beginning with SOR or SRT, which can be viewed on the Electronic Prospect Inquiry Form (SRIPREL) and the Electronic Prospect Detail Form (SRAPREL). Self-service admissions data is loaded into temporary tables beginning with SARXXXX. Data loaded into the SARXXXX temporary tables can be viewed on the Electronic Application Submitted Form (SAAETBL).

Once external data has been loaded into its respective temporary tables, it can be matched manually (using SRIPREL or SAAEAPS) or in batch (using SRRSRIN or SARETMT). The manual match process uses the Common Matching Entry Form (GOAMTCH) and the Common Matching algorithm to match incoming records to existing Banner records.

## Setting up Rule Restrictions on GORCMRL

The rules that define how the Common Matching algorithm searches for duplicates are defined on the Common Matching Rules Form (GORCMRL). There are certain restrictions on these rules:

- The algorithm requires that the last name or non-person name (SPRIDEN\_SEARCH\_LAST\_NAME) be included in all your rules.
- For data elements where you can change the number of characters to use in matching from what exists in the data dictionary, you cannot change the length to zero.

- If you enter a negative length for the number of characters to compare for the the field, the algorithm will start checking the specified number of characters with the last character in the string.

 **Note**

SunGard Higher Education recommends that you not use a negative length for SSN/SIN/TIN. It could create performance issues. ■

Different pieces of data are required depending on whether you are adding a person or non-person record:

- For a *person* record, data in **Last Name** and **First Name** must exist. No other data is required to initiate the Common Matching process. If data is entered in the **Last Name** field, the GOTCMME\_ENTITY\_IND must equal *P* for matching a person.
- For a *non-person* record, data in the Non-Person Name only must exist. No other data is required to initiate the Common Matching process. If data is entered in the **Non-person Name** field, the GOTCMME\_ENTITY\_IND must equal *C* for matching a non-person.

## Using the Common Matching Algorithm

The Common Matching algorithm uses the rules you create to evaluate new identification records that are being added to the Banner database to see if they already exist. The algorithm will return:

- *New* if no matching records or potential matches are found, based on the rules defined for the matching source.
- *Match* if only one record is found that matches all the criteria of the rules. In this case, the algorithm will return the PIDM.
- *Potential Match (Suspense)* if multiple records are found that match the criteria, or if records are found that match only some of the criteria. In this case, the algorithm returns the PIDMs of all possible matches. The data is stored in a temporary table until the user finishes investigating them.

 **Note**

When the algorithm is matching on non-code fields such as name, the `gokcmpr.f_compress_name` function will remove spaces, special characters, and force the text to be upper case. ■

For a match or a potential match, the conditions met and unmet will also be returned, for example:

*Name Match, Date of Birth Year Match, Address No Match*

## How the Matching Process Works in Banner Student

When you enter an ID on SPAIDEN that does not exist in Banner and then execute the matching process, you can receive a match status of “New”, “Match”, or “Potential Match”.

### New Records

Records are matched with a status of “New” if no records match, based on the rules that have been set up. When a record is identified as being new, the General Person APIs are used to insert the data into SPRIDEN, SPRADDR, SPRTELE, SPBPERS, and/or GOREMAL. Once the record is made new, you are returned to SPAIDEN.

### Matched Records

Records are matched with a status of “Match” if one, and only one, record in Banner matches the incoming person based on the rules that have been set up.

Data for the matched PIDM is displayed for review by the user. You can select the matched record and return to the main window of SPAIDEN, or you can update the matched person with data entered in the Data Entry block on GOAMTCH before returning to SPAIDEN.

### Potentially Matched Records

Records are matched with a status of “Potential Match” (or “Suspense”) if some, but not all, fields match someone in Banner based on the rules that have been set up. For example, the first and last names for the record match, but the date of birth does not match.

You can create the person as “New”, or you can select one of the potentially matched records as the “Match”.

### Rule Examples

Here is one set of rules that can be used in Banner Student.

Priority	Column Name	Data Element	Length	Required/Exists
2	SPRIDEN_SEARCH_LAST_NAME	LAST NAME/NON-PERSON NAME	10	Required
	SPRIDEN_SEARCH_FIRST_NAME	FIRST NAME	10	Required
	SPBPERS_SSN	SSN/SIN/TIN	9	Required
	SPBPERS_BIRTH_DAY	DATE OF BIRTH DAY	2	Exists
	SPBPERS_BIRTH_MON	DATE OF BIRTH MONTH	2	Exists

Priority	Column Name	Data Element	Length	Required/Exists
	SPBPERS_BIRTH_YEAR	DATE OF BIRTH YEAR	4	Exists
	SPRADDR_CITY	CITY	10	Exists
	SPRADDR_ZIP	ZIP/POSTAL CODE	5	Exists
3	SPRIDEN_SEARCH_LAST_NAME	LAST NAME/NON-PERSON NAME	10	Required
	SPRIDEN_SEARCH_FIRST_NAME	FIRST NAME	10	Required
	SPBPERS_BIRTH_DAY	DATE OF BIRTH DAY	2	Exists
	SPBPERS_BIRTH_MON	DATE OF BIRTH MONTH	2	Exists
	SPBPERS_BIRTH_YEAR	DATE OF BIRTH YEAR	4	Exists
	SPRADDR_CITY	CITY	10	Exists
	SPRADDR_ZIP	ZIP/POSTAL CODE	5	Exists

## Matching Algorithm - Primary and Secondary Matches

The matching algorithm used with Common Matching processing is composed of two matches - primary and secondary. The primary match selects a pool of Banner records that may match based on first, middle, and last name, and/or SSN and ID. If a record is selected as part of the primary match, then at a minimum it will be a potential match. The secondary match then looks at all the records from the primary match pool and uses the rest of the fields in the matching rule to see if only one record matches exactly. If only one record matches exactly, that record is a match. If more than one record matches, then all those records that match or partially match become the potential matches.

An exception to this process is if an incoming record has passed the primary match, but all of the other non-name elements included in the matching rule do not match (and none of the fields are null), then the person is made new.

For example, a rule could be set up as follows:

Element	Required	Length
Last Name	Required	10
First Name	Exists	8

Element	Required	Length
City	Exists	8
ZIP	Exists	5
Date of Birth	Exists	

Banner contains a SPRIDEN record for Joseph Smith in Tampa, FL, born on April 11, 1982. The incoming record is also for a Joseph Smith who lives in Boston, MA, and who was born on August 18, 1981. Assuming there were no other Joseph Smiths in the Banner database, the incoming record would be marked *New*. It would normally have been marked as *Suspended*, because the first and last names matched, but as the rest of the elements in the rule (City, ZIP, Date of Birth) specifically did not match, the person was made new.

## How the Algorithm Processes Rules

The Common Matching algorithm allows for the processing of multiple rules. Priority numbers must be defined for each rule indicating the sequence in which they are to be processed. The strictest rule should be assigned the first priority (i.e., #1). The algorithm will process each rule in order, separately and completely.

- The first step performed by the algorithm is primary matching for the rule. This step defines the population on which the rest of the processing (secondary match) will be performed. If no match occurs during the primary match, then the external record is considered to be new.
- The second step performed by the algorithm is secondary matching processing against the results of the primary match. If the secondary match determines an exact match on only one record, the external source record is considered to be a match.

If more than one record is matched to the criteria, the external source record is considered to be in suspense. The external source record will be considered to be in suspense if data matches part of the criteria of the rules but does not match all the criteria. If the results of the rule are new or matched, the results are returned to the calling process. No other rules are processed.

When all the rules have been processed, the algorithm will interrogate the results and return the results to the calling process. The match status (new, matched, or suspense) will be returned, as well as a results message providing the elements that were matched, not matched, or missing as a result of processing the rule.

When processing online, if a record is determined to be a match using one rule but to be in suspense using one or more additional rules, the record's match status will be set to match, but the user will still be able to view the potentially matched records.

## Rule Indicators

The **Data Required** field on GORCMRL can be set to *Exists* or *Required*.

- A value of *Required* indicates that the data field associated with the indicator is required and must be present on the external source and in Banner. If the field on either the external source or in Banner is null for a data element with the **Data Required** field set to *Required*, then the data element is considered to be not matched. If all data elements are required, but all of the data elements in the secondary match are null either in Banner or the external source, the record will be suspended for review.
- A value of *Exists* indicates that either the external source or the Banner value can be null. If either or both values are null, the field is considered to be a match.

## Rule Priorities

The algorithm processes each rule that has been defined for the data source separately based on the priority given in the Rule Priorities block. If the priority rule determines that the input record is either *New* or *Matched*, that status is the overall status that is returned for the record.

### Note

For online processing, the potential matches that result from processing the rules may be viewed online from the Potential Matches block on the Common Matching Entry Form (GOAMTCH). Potential matches are listed in order by rule priority. ■

## Field Length Values

Whenever a length is specified for a rule on the Common Matching Rules Form (GORCMRL), the comparison is made using the rule length of the fields. For example, using the last name, the comparison would be between the rule lengths of the last name on the external source to the rule length of the last name in Banner. If the rule length is five, then the first five characters of the external source last name are compared to the first five characters of the Banner last name.

A negative length may be entered for the ID and SSN/SIN/TFN to reverse the order from last to first. For example, if -5 is entered for the length of the SSN/SIN/TIN, the last five characters of the external source SSN will be compared to the last five characters of the Banner SSN/SIN/TIN.

For example, for the rule below:

Last Name length = 4

First Name length = 3

SSN/SIN/TFN length = -4

Patricia Longnecker, SSN/SIN/TFN #555116789

The results would be:

The first four characters of the last name would be used: LONG

The first three characters of the first name would be used: PAT

The last four characters of the SSN/SIN/TFN would be used: 6789

## Suggested Rules

It is recommended that each external source type have at least two GORCMRL matching rules defined in order to maximize the number of matches, and therefore minimize the number of suspended records. The key difference between the two recommended rules is in the use of the **Social Security Number** field.

Many institutions now use generated IDs when creating SPRIDEN records in Banner due to the increased reluctance to ask for and to provide social security numbers. This necessitates a matching rule that does not use the **Social Security Number** field, as it will never match to the Generated ID. However, matching on an SSN in combination with a first and last name is still superior to matching only on last and first name alone. So, a second rule incorporating the **Social Security Number** field ensures that if the SSNs are present, it will use them in the matching process.

Rule 1:                   SSN = Y, 9  
                              Lname = Y, 5  
                              Fname = Y, 4  
                              City = Y, 7  
                              ZIP = Y, 5

Rule 2:                   Lname = Y, 5  
                              Fname = Y, 4  
                              City = Y, 7  
                              ZIP = Y, 5

Rule 3:                   SSN = R, 9  
                              Lname = Y, 5  
                              Fname = Y, 4

## Primary Matching Logic

The primary matching process uses Last Name/Non-Person name (SPRIDEN\_SEARCH\_LAST\_NAME), which is a required data element for Common Matching. If First Name (SPRIDEN\_SEARCH\_FIRST\_NAME) or Middle Name (SPRIDEN\_SEARCH\_MI) are specified data elements in a rule, these will also be used as part of the primary match for the name. In addition, if ID (SPRIDEN\_ID) and/or SSN/SIN/TFN (SPBPERS\_SSN) are specified data elements in a rule, they will be used as part of the primary match.

The Common Matching process will use the **Match Type (Indicator)** setting that has been established for the matching source on the Common Matching Source Code Rules Form (GORCMSC) to determine which records are to be selected in Banner.

- When the **Match Type (Indicator)** is set to *Person*, person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *P*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *P*.
- When the **Match Type (Indicator)** is set to *Non-Person*, non-person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *C*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *C*.
- When the **Match Type (Indicator)** is set to *Both*, person and non-person records will be selected. When GORCMSC\_ENTITY\_CDE is set to *B*, records will be selected from SPRIDEN where SPRIDEN\_ENTITY\_IND is set to *P* or *C*.

The following steps are used in the primary matching process:

*Either Step 1 or Step 2 below must be true for a record to pass the primary match. If the external record fails the primary match, then the match status will be marked as new.*

1. If the SSN/SIN/TFN is defined for the matching source and rule priority number, retrieve all records from Banner with a matching SSN/SIN/TFN.

The SSN/SIN/TFN data element is defined as part of the rule, and the SPBPERS\_SSN is equal to the external source SSN/SIN/TFN.

2. If First Name and/or Middle Name are defined for the matching source and rule priority number, combine them with the Last Name criteria, and retrieve all records from Banner with a matching name.

### Note

When matching non-person records, the First and Middle Names should not be included as part of the rule. ■

- 2.1. The following must be true:

SPRIDEN\_SEARCH\_LAST\_NAME must equal the last name on the external source for the specified length.

 **Note**

If the matching source is defined to match non-person records, and `SPRIDEN_SEARCH_LAST_NAME` is not like the non-person name from the external Source, the matching algorithm will check to see if a matching record exists on the `GORPNM` alias table. ■

**2.2.** One of the following must be true:

First Name data element is not defined.

*or*

First Name data element is defined for the rule, and `SPRIDEN_SEARCH_FIRST_NAME` is equal to the external source first name for the specified length.

 **Note**

If the `SPRIDEN_SEARCH_FIRST_NAME` is not like the first name from the external source, the matching algorithm will check to see if a matching record exists on the `GORNAME` alias table (if the matching source is defined to match person records). ■

**2.3.** One of the following must be true:

Middle Name data element is not defined.

*or*

Middle Name data element is defined for the rule, and `SPRIDEN_SEARCH_MI` is equal to the external source middle name for the specified length.

 **Note**

If the `SPRIDEN_SEARCH_MI` is not like the middle name from the external source, the matching algorithm will check to see if a matching record exists on the `GORNAME` alias table (if the matching source is defined to match person records). ■

- 3.** If ID is defined for the matching source and rule priority number, retrieve all records from Banner with a `SPRIDEN_ID` that is equal to the external source ID.

## Secondary Matching Logic

The secondary matching process compares the data elements defined for the matching source and rule priority number for all records returned by the primary matching process. The goal of the secondary match is to find an exact match between the external source record and a Banner record.

When comparing a data field that has the **Data Required (Indicator)** set to *Exists*, a null value may exist either in Banner or the external source. If a null value exists either in

Banner or the external source for the data element, the data element is considered to be matched.

When the **Data Required (Indicator)** is set to *Required*, if a null value exists either in Banner or the external source for the data element, the data element is considered to be not matched.

This step is repeated for each of the data elements for the rule, and one condition must be true for each for an external source record to be considered to be a match.

- Data element is not defined.
- Data element **Data Required (Indicator)** is set to *Exists* or *Required*, and the Banner value is equal to the external source value for the specified length.  
*or*
- Data element **Data Required (Indicator)** is set to *Exists*, and the Banner value is null.  
*or*
- Data element **Data Required (Indicator)** is set to *Exists*, and the external source value is null.

When the data being matched is part of a logical unit (such as an address), the logical unit is matched separately and completely. For example, when matching on city and ZIP code, the city and ZIP code must be associated with one address.

 **Note**

There is an *exception* to be aware of. For an external source record to be considered as new when the record has already passed the primary match, all non-name data elements must be determined as not being a match, and none of the non-name elements may be null. ■

## Examples of Matching Algorithm Process and Results

Here are some examples of how the matching algorithm works.

### **Example 1:**

If all required data elements are missing, the record will be suspended.

Last Name = Required

First Name = Required

Date of Birth Day = Required

Date of Birth Month = Required

Date of Birth Year = Required

City = Required

*Banner values:* Mildred Jones, Date of Birth = 08/17/1957, City = Topeka

*External values:* Mildred Jones

The external record will pass the primary match, because the first and last names match. However, since all other data elements are missing (i.e, null) from the external source (not matched but are null), the record will be suspended.

**Example 2:**

The external record passes the primary match as the first and last name matches against two Banner records. These two records are then used in the secondary match.

**Rule 1**

Last Name = R

First Name = Y

SSN = Y

Date of Birth = Y

City = Y

ZIP Code = Y

**Rule 2**

Last Name = R

First Name = Y

Date of Birth = Y

City = Y

ZIP Code = Y

The value *R* stands for *Required*. The value *Y* stands for *Exists*.

*Banner values:*

Record 1 - Alberta Rockville, 330229101, Largesse, 06259, 05/01/1985

Record 2 - Alberta Rockville, no SSN, Pomfret, 19355, no Date of Birth

*External values:* Alberta Rockville, 330229101, Largesse, 06259, no Date of Birth

The external record will pass the primary match, because the first and last names match at least one Banner record with the same first and last names.

- Using Rule 1 and the matching algorithm, the external record will be matched against Banner record 1. It will be suspended against Banner record 2.
- Using Rule 2, the external record would be matched against Banner record 1, since the Date of Birth is missing and the City and ZIP match.

### Example 3:

The external record passes the primary match, which usually means that the match status will be *Suspense* at a minimum. However, in this case, because none of the non-name/SSN fields match, the external record has a match status of *New*.

#### Rule 1

Last Name = R

First Name = R

SSN = Y

Date of Birth = Y

City = Y

ZIP Code = Y

#### Rule 2

Last Name = R

First Name = R

Date of Birth = Y

City = Y

ZIP Code = Y

The value *R* stands for *Required*. The value *Y* stands for *Exists*.

*Banner values:* Tomasso Dalimonte, SSN = null, Date of Birth = 06/02/78, City = Marikesh, ZIP = 11233

*External values:* Tomasso Dalimonte, SSN = null, Date of Birth = 09/07/59, City = Woodstock, ZIP = 06281

The external record will pass the primary match, because the first and last names match. Normally, this would mean that the record would be suspended at a minimum. However, because the Date of Birth, City, and ZIP Code fields specifically do not match (i.e., none of them are null), then the record's match status is set to *New*. This is the only exception to the basic matching algorithm.

## Search and Test Score Tape Load

### Overview

The search and test score tape load process allows data from the College Board's Student Search Service, Peterson, and ACT EOS and Private Colleges and Universities search tapes or the data from a tape for SAT, ACT, GRE, GMAT, and AMCAS test scores to be loaded into the Banner Student System. In addition, delimited files (such as AMCAS) can be loaded. The data is initially loaded into separate temporary tables due to its potentially large volume of records.

You may choose to load records individually from the temporary tables into Banner Production tables. Or, you may perform a mass load, taking into account records that may match an existing Banner record. The data in the temporary tables is always accessible using two Banner Student forms. The data may also be used to run reports, create labels,

and generate letters based on a combination of data in the temporary tables and the Banner tables. The purge process is also available to purge temporary table records created by the search or test score report tape load process.

The tape types supported by the search tape and test score tape load functionality are:

- SAT
- ACT
- GRE
- GMAT
- SSS Student Search Service
- Peterson
- ACT EOS Educational Opportunity Service
- PCU Private Colleges and University Search Tape
- AMCAS

Each tape is identified by the electronic prospect code (from STVPREL) and a tape code. These codes will be referred to throughout this process. The codes are system-required on the Electronic Prospect Validation Form (STVPREL) and the Electronic Data File and Tape Validation Form (STVTAPE).

<b>Tape</b>	<b>Prospect Code from STVPREL</b>	<b>Tape Code from STVTAPE</b>
SAT	SAT	SAT
ACT	ACT	ACT
GRE	GRE	GRE
GMAT	GMAT	GMAT
SSS (psat)	SSS-PSAT	SSS_SEARCH
SSS (sat)	SSS_SEARCH	SSS_SEARCH
Peterson	PETERSON	PETERSON
ACT EOS	EOS_ACT	EOS_ACT
PCU	PCU	PCU
AMCAS	AMCS	AMCS

This tape load process uses one program to load data from a file to Oracle. This process can be run from job submission. Once loaded into Oracle, the data is initially loaded into

separate temporary tables due to its potential volume of records. You may choose to load records individually from the temporary tables into Banner production tables. Or, you may perform a mass load, taking into account records that may match an existing Banner record. The data in the temporary tables is always accessible using two Banner Student forms. The data may also be used to run reports, create labels, and generate letters based on a combination of data in the temporary tables and the Banner tables. The purge process is also available to purge temporary table records created by the search or test score report tape load process.

 **Note**

For detailed information on processing AMCAS tape loads, please refer to the section “AMCAS (American Medical College Application Service) Load Procedures Using SRTLOAD” in the procedures section for this chapter. ■

## Use of PIDM In Data File

Data (flat) files are often created and/or downloaded by institutions and sent to marketing organizations. Various data in the file (name, address, etc.) can then be changed by the marketing organization and returned to the institution. When the flat file is returned, the PIDM (if included) can be used to match the incoming tape record to Banner. This reduces creating suspended or duplicate records.

Use the tape/file field name of PIDM (description is *PIDM if person was prior match*) on the Tape Field Name Validation Form (STVTPFD), and apply the rule on the Tape Field Position Rule Form (SRATPFD) for the corresponding tape code to reduce the risk of creating suspended or duplicate records during the matching process.

## Handling of IDs in Temporary Table

SRTLOAD and electronic prospects only load generated prospect IDs to the temporary table. This prevents wasting generated Banner IDs that are also loaded to the temporary tables. If the tape or Web prospect has an SSN, and SRTLOAD or SAAERUL is set to use the SSN, the SSN will be loaded to the temporary table.

SRRPREL and SRIPREL generate a brand new Banner ID only when loading the prospect to Banner for the first time. Prospect IDs that were created in the temporary table SRTIDEN will never be loaded to Banner, unless the SSN was chosen as the temporary ID. Then the SSN will load to Banner if it is found to be a *New* record.

 **Note**

If you are loading Web Prospects or tape records using the SSN as the temporary SRTIDEN \_ID (SAAERUL: group *PREL*, label *WEBGENID*, is set to *S* for Generate ID if Web Prospect or SRTLOAD: SSN or Generated ID parameter is set to *S*), and during the matching process (on SRIPREL or SRRSRIN) the record is determined to be *New* (no match in Banner), but a Banner ID does exist that happens to be identical to the

SSN that was loaded into the temporary table, upon loading this *New* record to Banner (via SRIPREL or SRRPREL), an error will appear: ■

142228889 Boatwright, N 200010 UG 000 311420 Potential Dup ID on SPRIDEN  
Kwame

 **Note**

In this situation, the record must have a new prospect ID generated on SRIPREL (using the Associate Person with ID window on SAAEAPS) in order to be loaded to Banner and so avoid the possible creation of duplicate IDs. ■

## Overall Process

A search tape file or a test file is received from either College Board/SSS, Peterson, EOS (from ACT), AMCAS, or Private Colleges and Universities, or a test score tape file is received, and the data is moved to your host machine. Using the C program SRTLOAD, the data from the search or test score tape is loaded into a set of temporary tables (SRTIDEN, SRTPERS, SRTTELE, SRTADDR, SRTTEST, SRTPREL, SRTTHSCH, SRTPCOL, SRTEMAL, SRTGPAT, SRTCROSS, SRTSUPL, SRTDEGR, SRTMAJR, SRTTSPC, SRTPRAC). These tables are easily accessible through the Search Tape View (SRVPREL). You can then use either the online forms or the match and load processes to load search tape or test score records into the Banner production tables.

Add the interface codes to the Interface Code Validation Form (STVINFC) to identify the different search and test score tapes. To associate each interface code with its matching rules, assign a matching source code to each interface code on STVINFC. You may want to verify that all test score types (SAT, ACT, ACT EOS, GRE, GMAT, and AMCAS) and search types (PSAT, Peterson, PCU) are defined appropriately. Define similar codes on the Electronic Data File and Tape Validation Form (STVTAPE) to associate a specific tape with its predefined field positions on the Tape Field Position Rule Form (SRATPFD). For delimited files, use the Tape File Delimiter Type Rules Form (SORDLIM) to specify what delimiter (and optionally what marker) is used with this file. Define prospect codes, very similar to interface and electronic data file codes, on the Electronic Prospect Validation Form (STVPREL). These codes are associated with the search and test score report tape data loaded into the temporary tables and the Search Tape View (SRVPREL).

There are two options available for loading the search or test score tape data into Banner production from the temporary tables.

### Option 1: Batch Load

The Electronic Prospect Match (SRRSRIN) uses the Common Matching algorithm to determine if a record already exists in Banner for persons in the temporary tables.

- If the record exists in Banner, then the match status on the temporary table for this record is set to *M* (Matched).

- If the record does not match, then the match status is set to *N* (New).
- If the record is considered a suspense, (that is, some elements are matched but not enough to be considered a match), then the match status is set to *S* (Suspense).
- If the record exists on the tape multiple times, or if it exists in the temporary tables more than once for the same electronic prospect code and tape ID, the records are set to *D* (Duplicate).

All records in the temporary files can be viewed on the Electronic Prospect Inquiry Form (SRIPREL). Those records with a status of suspense or duplicate can be viewed on this form by running a query on a match status of *S* or *D*. You may access the Common Matching Entry Form (GOAMTCH) from this form, which runs the matching algorithm using the data in the temporary tables to determine if a matching record exists. Based on the results of the algorithm, you must decide if the record matches an existing Banner record or whether it is a new record. For more information on using GOAMTCH, please refer to the “General Person” “Procedures” section.

Once all suspended or duplicated records have been updated to either *N* (New) or *M* (Matched), the Migrate Electronic Prospects Process (SRRPREL) is run. Depending on the values set for the parameters, as well as the values set for the rules on SAAERUL, a new recruit record may be created or an existing record may be updated at the time the test scores are loaded. If an address with the same address type already exists in Banner, then an additional address record may be created with the same address type and a one-up sequence number. If an existing recruit record is to be updated, then a contact for this specific tape will be added to the record.

If a match does not exist, then a recruit record is created at the time the test scores are loaded for the person (using either the SSN or a generated ID) for the term and level (and campus, if identified in the Electronic Prospect Load Process (SRTLOAD)) specified in the parameters. In addition, records may be created for this person on the following forms, depending on the rules settings on the Electronic Admissions Application Rules Form (SAAERUL):

- SPAPERS – demographic information
- SPAIDEN – address information
- SPATELE – telephone information
- GOAINTL - international information
- SOAPCOL – prior college information
- SOAHSCH – high school information
- SRARECR – source, contact, and interests
- SOATEST – test scores (for test score tapes only, including percentiles for SAT and GRE files)

- SAAADMS – application information
- SOASUPL – applicant supplemental information, for AMCAS only

If a match exists, then what happens will also depend on the values set on the Electronic Admissions Application Rules Form (SAAERUL) where the **Group (Code)** is equal to *PREL*. An existing recruit record may be updated with a new source and/or contact, or an entirely new recruit record may be created at the time the test scores are loaded.

Regardless of the values set on SAAERUL, any null fields on the General Person Form (SPAPERS) will be filled in if the data for these fields exists on the search or test score tape. In either case, the load status on SRIPREL is set to *C*, indicating that a Banner record was created or updated for this person using the data in the temporary tables.

## Option 2: Individual Record Loads

1. Use the Electronic Prospect Inquiry Form (SRIPREL) to query the Search Tape View (SRVPREL) when a person has a stack of returned search cards or paper test score reports, and they need to find the record that matches each. You can search on the following fields: **Prospect ID, Last Name, First Name, M(iddle) I(nitial), Prospect Code, Tape ID, Match Status, Load Status, Street Line 1, ZIP, High School, Birth Date, and Add Date.**

Once a matching record or group of potential matches has been retrieved, you can select a specific record and select the Detail item in the Options Menu.

2. This accesses the Electronic Prospect Detail Form (SRAPREL). This form displays biographical information associated with the search or test score tape record selected on SRIPREL, information about the search tape from which this record was created, or test score information, interest information, and information about the test score report tape from which this record was created.

Once you are convinced you have the correct person, use the **Exit** button to return to the Electronic Prospect Inquiry Form (SRIPREL).

3. A load status code exists for each record in the Search Tape View (SRVPREL). The load status is displayed on the Electronic Prospect Inquiry Form (SRIPREL) and, if it is set to *C*, indicates that a Banner record has been created or updated in Banner for this person from a tape load process. You can refer to the Prospect Code information to determine what type of tape load was used with this record. (If the field is blank, then the record has not been created or updated in Banner.)
4. A match status also exists for each record in the Search Tape View (SRVPREL). This status indicates that the record matched (*M*) someone in Banner production (via the SRRSRIN process or the **Select ID** or **Update ID** buttons on GOAMTCH), that the record is new (*N*) and this person does not exist in Banner, that the record is suspended (*S*), that it is a duplicate (*D*) on the tape, or that an error (*E*) occurred when the SRRSRIN match process was run.

If the record's **Load Status** and **Match Status** fields are blank (indicating that this record has not been matched or loaded), then you need to see if the person already exists in Banner.

Use the Match (GOAMTCH) item in the Options Menu on SRIPREL to go to the Associate Person with ID window on SAAEAPS. Use the **Associate Person with an ID button** or use a Save function to then access GOAMTCH.

5. Before accessing GOAMTCH, you will be asked to assign an ID to the new user, either a generated ID or the person's SSN. *GENERATED* is the default.

When you enter GOAMTCH, the **ID** field will contain either the word *GENERATED* or the selected record's SSN. The **Matching Source** field will contain the matching source code that has been assigned to the interface code, which is also assigned to the electronic prospect code of the selected record on STVPREL.

If no matching source code has been assigned to the interface code, then the **Matching Source** field will contain the default matching source code that has been assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, then you will be able to select any matching source code from the List of Values.

6. Perform a Next Block to populate the Data Entry block with all of the data for the incoming prospect record that is present in the temporary tables.
7. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the prospect's record is created.
8. Perform a Next Block to run the matching algorithm. The algorithm will determine if the incoming record is new, matched, or a potential match.
9. Determine if the record is to be new or matched, and select the appropriate button.
10. The user will be automatically returned to SRIPREL. The match status will *always* be *Matched*, as the person has now been created in Banner via GOAMTCH. Continue with regular SRIPREL load processing.
11. The **Match Status** field will have been updated and will display an *M* for this record when a new query is run. Whether a match exists in Banner or not, you must select the Create Recruit/Applicant item in the Options Menu to either create or update a Banner recruit record and associated records. The **Load Status** will be set to *C*, indicating that a Banner record has been created and/or updated for this person.

## Purging Records

Use the Electronic Prospect Purge Process (SRTPURG) to purge data from the temporary tables based on the input parameters.

- Use the Electronic Prospect Code parameter to purge all records associated with a specific search tape (for example, Peterson) or specific tape type (for example, SAT).
- Use the Tape ID parameter to:
  - Purge all records associated with one tape of many received from the same search company (for example, College Board Search tapes). For example, two separate tapes may be requested from Student Search, one for students in a specific region, and one for students with certain Advanced Placement exam scores.
  - Purge all records associated with a specific test score tape of many received from the same source. For example, if you use different Tape IDs for each tape load such as SAT1, SAT2, and so on, you will be able to purge only those SAT records associated with the Tape ID SAT1 while leaving the other SAT records on the temporary tables untouched.

## Other Optional Processes Related to Tape Load

### SAT Recentering Process (SOPSATS)

Use the SAT Recentering Process (SOPSATS) to re-center SAT scores at your institution. This step is completed only when SAT tapes are loaded.

The College Board has recentered the score scale for the SAT I as of the April 1995 national administration, which impacts the way scores and other data are reported to your institution. While the 200-800 scale continues to be used, recentering the SAT I has the effect of re-establishing the average score at 500, the mid-point of both the verbal and math scores. This change in SAT I scores also results in changes to the scores for the SAT II subject tests, which are aligned to the SAT I.

Running the SAT Recentering Process (SOPSATS) is the final step in the tape load process when loading SAT tapes. SOPSATS must be run each time an SAT tape is loaded. Once the SAT Recentering Process (SOPSATS) has been run, the original score for a person is no longer displayed in the system; only the re-centered score appears on the Test Score Information Form (SOATEST), where SAT scores are entered and maintained. The **Rcrv** field (Revised/Recentered) on SOATEST flags whether the SAT score displayed is:

NULL	indicates the score has not been changed and should be recentered
R	indicates the score has already been recentered
X	indicates the score has been revised but can be recentered
Z	indicates the score has both been revised and recentered.

The SOPSATS process looks at this flag to determine which scores to recenter. SAT scores that are marked with:

- a null value will be recentered and the flag changed to an R,
- an R will be not be recentered,
- an X will be recentered, and the flag changed to a Z, and
- a Z will not be recentered.

 **Note**

SAT scores which are dated after April 1, 1995 will not be recentered by this report. There is currently no date upon which all scores on a tape will be recentered. ■

For example, if Judy Smith has these scores

Test Code	Description	Score	Date Taken	Rcrv
S01	SAT Verbal	600	15-MAR-94	NULL
S02	SAT Math	500	15-MAR-94	NULL

the report will recenter her scores because they:

- are dated prior to April 1, 1995, and
- have a null value, indicating they can be recentered.

After running the SOPSATS process on this information, her scores would look like this on SOATEST:

Test Code	Description	Score	Date Taken	Rcrv
S01	SAT Verbal	670	15-MAR-94	R
S02	SAT Math	520	15-MAR-94	R

Her original score is no longer displayed. Her recentered scores appear here, flagged with an R in the **Revised or Recentered** field to show they have been recentered. If you are using SunGard Higher Education's tape load process, the SOPSATS process must be run after each tape load of SAT scores.

 **Note**

The new scale for reporting SAT scores may affect your admissions decision process and other processes at your institution. It needs to be determined by your institution if the minimum requirements should be modified. ■

The SAT I tables only deal in scores with increments of 10 (such as 630, 640, 650). The SOPSATS process only converts scores that are originally reported in increments of 10, as all others are invalid scores.

According to the College Board, all SAT scores are reported in increments of 10, so SOPSATS only recenters scores that are reported in increments of 10 (630, 640, 650). If a person has a recorded score of 642, this value is not recentered via the SOPSATS process.

If your institution creates its own combined score of verbal and math, you should recenter the verbal score, recenter the math score, and then add them for the composite. This gives your institution the most accurate picture of what the new composite score is on the recentered scale.

Please refer to the “Required System Values for Validation Forms” section of the “Validation Forms” chapter for a listing of the SunGard Higher Education system-required codes as defined on the Test Code Validation Form (STVTESSC). Only tests with these codes are converted via the SunGard Higher Education-delivered scripts. If you use different values at your institution, you will need to make the appropriate changes to the scripts, for both the SAT I and SAT II codes.

### **Communication Plan Processing Report (SORCPLN)**

This process is optional but highly recommended and assigns the communication plans and generates the materials for persons processed by the tape load. If you do not run SORCPLN, communication plan assignments and material generation will not take place, and the records inserted in the Communication Plan Collector Table (SORCCOL) will not be processed. Note that SORCPLN processes all records in the Communication Plan Collector Table regardless of source, so existing records will also be processed.

### Steps for Individual Record Tape Load Processing

1. Create the data file for loading.
2. Run SRTLOAD to load the data into the temporary tables.

Always run SRTLOAD in audit mode first to determine the values that are missing in Banner. These values will need to be created in Banner or converted on SOTCNVT (where appropriate) before running SRTLOAD in update mode.

3. Use the functionality on SRIPREL (Create Recruit/Applicant item in the Options Menu) to:
  - Query record(s) for the desired tape type.
  - Resolve suspended or duplicate records using the Common Matching Entry Form (GOAMTCH).
  - Create new search or test score records or update existing search or test score records.
  - Create new recruiting records.
  - Insert new source data into existing recruiting and admissions data.

4. (Optional) Run SRTPURG to remove records from the temporary tables based on the report parameter values.

## Steps for Batch Tape Load Processing

1. Create the data file for loading.
2. Run SRTLOAD to load the data into the temporary tables.

Always run SRTLOAD in audit mode first to determine the values that are missing in Banner. These values will need to be created in Banner or converted on SOTCNVT (where appropriate) before running SRTLOAD in update mode.

3. Run SRRSRIN to match the tape data and update each record's match status with a value of *M* (matched), *N* (new), *D* (duplicate), *S* (suspense), or *E* (error). This process uses the matching rules on GORCMRL for the matching source code identified with the prospect code on STVPREL.
4. Run SRRPREL to:
  - Automatically load new and matched records to Banner.
  - Create new search or test score records or update existing search or test score records.
  - Create new recruiting records.
  - Create a corresponding application record.
  - Insert new source data into existing recruiting and admissions data.
5. (Optional) Run SRTPURG to remove records from the temporary tables based on the report parameter values.

## API Errors on SRRPREL, SRRSRIN, and SRIPREL

API errors are all displayed or printed on the reports at the time of the load to Banner using batch loading (SRRPREL, SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y*) or manual loading on SRIPREL. The records revert to a status of *S* (Suspense) without loading any permanent Banner data. The API data issues can be corrected and the batch matching and load processes re-run, or the records can be manually matched and loaded on SRIPREL.

### Loading Records Using SRRPREL

After records have been assigned a match status using SRRSRIN, and SRRPREL is run to load the records to Banner, if API errors are encountered for an individual prospect ID, the prospect ID and the associated errors will be printed on the report, and the **Match Status** will revert back to *S*. No Banner data is loaded for these records, and the report

reflects that information. The API errors will also be printed in the `srrprel.log` file. The process will not abort when API errors are encountered, but records with API errors will not be loaded to Banner until those errors are resolved.

## Loading Records Using SRRSRIN

When matching and loading are performed using SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y*, if API errors are encountered, they will be printed on the report, and the **Match Status** will revert back to *S*. No Banner data is loaded for these records, and the report reflects that information. Also, the API errors for each ID will be listed in the `srrsrin.log` file.

## Matching and Loading Records Manually Using SRIPREL

When the records are loaded manually using SRIPREL, if API errors are encountered, those errors will be displayed in a window, and the **Match Status** will revert back to *S*. No Banner data is loaded for these records, and the report reflects that information. Also, the API errors for each ID will be listed in the `srrsrin.log` file. The API errors need to be resolved, and then record can be re-matched and loaded to Banner.

## Major Code Errors

Major codes on STVMAJR that are not valid cannot be entered on SOTCNVT for use with conversion codes. An error is displayed on SOTCNVT when you attempt to enter an invalid major code.

However, if the **Major (Indicator)** is unchecked on STVMAJR for a major code that had been previously entered as a valid major on SOTCNVT, you will receive the API error messages in SRRPREL, SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y*, and SRIPREL.

To resolve this issue, you can return to STVMAJR and check the **Major (Indicator)** for the major code, or you can remove the invalid major validation data on SOTCNVT. When you access SOTCNVT and an invalid major is listed, the following error message will be displayed: *ERROR Invalid Major Code; Press LIST for valid codes*. When you acknowledge that error message, you will be able to view SOTCNVT and identify the offending major code, since it will not have an associated STVMAJR value.

## Tape Load Processing for Nation Codes Using APIs

API processing requires that the nation code translate correctly and that the address be complete in order to be loaded. A record will not be loaded to Banner if the state code and/or ZIP code or nation code are missing. The nation name will never be loaded to the **Street Line 3** field.

SRTLOAD is used to determine whether the nation code translates correctly or not. Institutions need to make sure the nation code in question exists on STVNATN, so the record will be processed by SRRSRIN and SRRPREL. If the nation code does not exist on

STVNATN, when SRRSRIN is run with the Auto Load (Skip Dup Chk) parameter set to *Y*, or when SRRPREL is run, the record's match status will be changed from *N* or *M* back to *S* (Suspense), and an associated error message will be printed on the report.

Prospect ID: P00106279	Zip, state and nation cannot all be null								
P00106279	Statler, Karlene	S	200222	UG	BIOL	UNKNHS	Prospect not loaded.		

You will then need to use SRIPREL to correct the address and load the record manually.

## Creation of New Records and Display of Associated Messages

SRRSRIN, SRRPREL, and SRIPREL display messages as to whether recruit/applicant records or person records have been created. (The option to create or not create a recruit record is based on how the rules *MCREATENEWRECR* and *NMCREATENEWRECR* are set on SAAERUL. There is another rule, *CREATENEWRECR*, under the *PREL* group that also must have a value of *Y* before a recruit record is created.)

A general person record will always be created, so there will always be a total. If a recruit or applicant was not loaded for the term, but a previous applicant or recruit record existed in the term for which SRTLOAD and/or SRRPREL were run, then a total of the records that already had a record for the term will be counted in the total, even if they were not loaded in that pass.

For instance, when a tape with eight records is loaded to Banner for a *new* term, and no recruit or applicants exist, and no recruits or applicants are created by SRRPREL, then you would see the following.

SAAERUL settings:

*CREATENEWRECR* = *N*

*CREATENEWAPPL* = *N*

*NMCREATENEWRECR* = *N*

*MCREATENEWRECR* = *N*

Run SRRPREL to load eight records to Banner, and the results would be as follows:

- *Number of Prospects Read:* 8
- *Number of General Persons Migrated to Production Banner:* 8 \*\*\*NOTE: Eight of these records have general person records. Eight did not get loaded here. Create person *always* occurs for general person data. So there will always be a value here to load basic person information.
- *Number of Recruits Migrated to Production Banner:* \*\*\*NOTE: Zero recruits were loaded for this term via SRRPREL. This is correct. But if recruit records already

existed for this term but were not loaded via SRRSRIN, that total number of recruits would be listed here.

- *Number of Applicants Migrated to Production Banner:* \*\*\*NOTE: Zero applicants were loaded for this term via SRRPREL. This is correct. But if recruit records already existed for this term but were not loaded via SRRSRIN, that total number of recruits would be listed here.
- *Total Individuals Migrated to Production Banner:* 8 \*\*\*NOTE: Eight existed in the database, so they didn't get loaded this time; they were previously loaded/manually entered. Eight exist.
- *Number of Persons NOT Migrated to Production Banner:* \*\*\*NOTE: No records were loaded via SRKPREL for this run. This is correct.

## Processing Percentiles

Percentiles can be processed by SRTLOAD. The SRTLOAD process will load percentile data for SAT and GRE tests into the SRTTSPC temporary table. The data is then loaded to the Banner production tables using SRRPREL. The SORTSPC table stores the percentiles, which can be viewed on the SOATEST form. You also have the capability on SOATEST to load percentiles manually. Percentile types must first be created on STVTSPT. Only one percentile of the same type may be associated with a test score.

You may choose whether you wish to load SAT or GRE percentiles to Banner using the SAAERUL *LOADPERCENTILES* rule for the group code of *PREL*. A value of *Y* will load the percentiles to Banner. A value of *N* will ignore percentiles.

The tape load process will associate the percentiles with their corresponding test scores. Currently, only SAT and GRE files provide percentiles. SAT and GRE percentile types have been hardcoded for use by SRTLOAD. These codes are delivered for STVTSPT (percentile types), STVTPFD (percentile fields - SRTLOAD will associate these fields with their corresponding percentile types), and SRATPFD (percentile fields with begin and end positions).

### Note

If for any reason you want to change the percentile types that have been delivered and associated with GRE and SAT test codes in Banner Student, you can create new percentile types in STVTSPT and change the type associated with the test score on SOTCNVT. The percentiles will then be associated with the test codes on SORTSPC. ■

The following table contains the percentile types and the associated test scores for which they are currently reported. SRTLOAD has been hardcoded to associate these percentile types with the following test codes.

Percentile Type	Test Code
SVN	S01
SVS	S01
SMN	S02
SMS	S02
SWN	S07
SWS	S07
S2N	WR, WH, SP, SL, PH, MH, 2C, 1C, M2, M1, LT, LR, JL, IT, HB, GM, GL, FR, FL, ES, EN, EH, CL, CH, BY, AH, KL, EB, MB, EP, UH
GRP	GR01, GR02, GR03, G24, G241, G242, G243, G27, G271, G272, G273, G29, G291, G292, G293, G31, G311, G312, G313, G34, G341, G342, G343, G37, G371, G372, G373, G44, G441, G442, G443, G46, G461, G462, G463, G47, G471, G472, G473, G52, G521, G522, G523, G57, G571, G572, G573, G64, G641, G642, G643, G67, G671, G672, G673, G71, G711, G712, G713, G74, G741, G742, G743, G77, G771, G772, G773, G79, G791, G792, G793, G81, G811, G812, G813, G87, G871, G872, G873, G91, G911, G912, G913, G22, G221, G222, G223, G78, G781, G782, G783, G72, G721, G722, G723, G68, G681, G682, G683, G35, G351, G352, G353, GR05

## Search Tape View (SRVPREL)

The Search Tape View (SRVPREL) describes the contents of the following temporary tables: SRTIDEN, SRTPEERS, SRTTELE, SRTADDR, SRTTEST, SRTPREL, SRTHSCH, SRTPCOL. This view is used by the SRIPREL and SRAPREL forms. The data used from SRAPREL is found primarily in the Electronic Prospect Detail block.

## Electronic Prospect Validation Form (STVPREL)

Use this form to define the various types of search or test score tapes that are to be loaded.

The **Prospect Code** is associated with the search or test score tape data loaded into the search tape temporary tables.

Use the **Interface Code** to define which interface code (and therefore matching source code rules) should be used when loading this search or test score tape. The interface code

also determines which conversion rules to use as defined on the Tape Code Conversion Rules Form (SOTCNVT).

The **Tape Code** field associates the tape field positions defined on the Tape Field Position Rule Form (SRATPFD) with a specific prospect and interface code.

**Example:**

The Student Search tape can provide different data depending on whether it contains PSAT or SAT1 data. The file layout is the same in either case, but the major codes have different meanings.

So, the same tape code could be used with two different prospect and interface codes. The two interface codes allow you to set up the appropriate data conversions based on the two sets of input values for “Major”.

Please see the section on “Using the Student Search Service Tape Load with SRTLOAD” for information on how this will be changing in July of 2003 to a single tape of combined data.

## Electronic Data File and Tape Validation Form (STVTAPE)

Use this form to define the unique types of search or test score tapes that a school will load. These codes are associated with the field positions of each tape on the Tape Field Position Rule Form (SRATPFD).

## Tape Field Names Validation Form (STVTPFD)

Use this form to define all the possible field names into which search or test score tape data might be loaded. It may also be used to define all possible field names into which data from other tape sources might be loaded. The fields defined in this table are delivered by SunGard Higher Education.

## Electronic Prospects Default Options Form (SRAPRED)

Use this form to designate default values that can be used to populate the recruiting record (SRBRECR) or applicant record (SARADAP) when a record is created via the Migrate Electronic Prospects Process (SRRPREL) or by using the Create Recruit/Applicant item in the Options Menu on the Electronic Prospect Inquiry Form (SRIPREL). This form is also used by the tape load process.

This form is keyed by the prospect codes on the Electronic Prospect Validation Form (STVPREL), which allows different sets of default options to be created for different prospect codes. The **Recruit Source** and **Level (Code)** are required fields.

SRTLOAD uses the default values on SRAPRED if the corresponding parameter on SRTLOAD is blank. If the corresponding parameter on SRTLOAD is blank, SRTLOAD will use the data that exists on the incoming tape for such fields as Term, Major, etc.

(incorporating the use of SOTCNVT or the validation table if it is a straight conversion). If no value exists on the tape, then SRTLOAD will use the data in the parameter. If no value exists in the parameter, SRTLOAD will use the value on SRAPRED. Certain fields (i.e., Tape Source, SBGI Source Code, etc.) will be populated from STVINFC if no value exists on SRAPRED.

SRAPRED rules will create an application when no recruiting record is created, based on the appropriate rule settings on SAAERUL. Fields that are required for applications (such as student type for AMCAS or other files that do not include this value in any way) need to be set up on SRAPRED for the level code for which SRTLOAD is run so that the application student type and other necessary fields are updated. Providing defaults for the application will create a value, as opposed to a null or 00000, for the program or college, etc., on the application.

When data loaded to the temporary tables by SRTLOAD, the following checks are made: a direct match to a validation table is checked, then SOTCNVT is checked for crosswalk/conversion data, then the parameter values on SRTLOAD are checked, (as well as the existence of a contact and/or source on STVINFC), and finally SRAPRED is checked. SRAPRED is the only place that provides data for student type, program, or college code for the applicant.

SRAPRED values for AMCAS *must* be used for loading various AMCAS application data, since this information is not supplied on the incoming AMCAS file. Values such as student type (which is required for an application), college code, and program will only be added to an application when they have been added to SRAPRED for the level for which you are running SRTLOAD. Recruiting records may be generated, but institutions may choose to not load recruiting records and to only load applications (based on the appropriate SAAERUL rules). A specific rule for the electronic prospect code *AMCS* may be added to SRAPRED with minimal values updated for the level type, student type, college code, and program, if applicable.

## Tape Field Position Rule Form (SRATPFD)

Use this form to define either the exact positions in which each field exists on a search or test score tape or the relative position of each field and then to assign the value in those positions to the appropriate Banner fields.

This form, in combination with the Electronic Prospect Load (SRTLOAD), the Electronic Prospect Match (SSRSRIN), and the Migrate Electronic Prospects Process (SRRPREL), allows institutions to set up tape loads that are not supported by SunGard Higher Education, such as AP (Advanced Placement exams) or other search or test score tapes.

This form displays two sets of information. It displays fields for a default positional layout (such as SAT or ACT) or for a sequential layout (such as AMCAS or a comma delimited file). The layout displayed is determined by the tape code entered in the Key Block. If the tape code has been defined on the Tape File Delimiter Type Rules Form (SORDLIM), then the fields required to define a sequential delimited file will be displayed. If the tape code

has not been defined on SORDLIM, then the fields required to define a positional layout will be displayed.

The **Occurrence** field is used to accommodate those tape values that may occur multiple times such as test scores for different test dates. The fields defined in this form are delivered by SunGard Higher Education.

### Tape File Delimiter Type Rules Form (SORDLIM)

Use this form to assign a delimiter or marker to a specific tape code. The delimiter or marker should match those contained in the delimited input file to be used with this tape code.

### Tape File Test Score Controls Form (SRATPTS)

Use this form to map the test code which contains the “date taken” to all the other test codes for which that date taken applies. For example, the date taken for one set of SAT I scores is contained in only one place, even though that date applies to both the SAT Verbal and Math scores.

### Electronic Prospect Detail Form (SRAPREL)

Use this form to view biographic and search or test score tape data for a person that has been loaded to the temporary tables. The form allows you to view all search tape records for this ID which are present in the Search Tape View (SRVPREL).

This form is accessed independently or from the Electronic Prospect Inquiry Form (SRIPREL) using the Detail item in the Options Menu.

### Electronic Prospect Inquiry Form (SRIPREL)

This form is used to query and view records in the Search Tape View (SRVPREL). This form is also used in conjunction with the Search Tape Matching Process (SRRSRIN) and the Migrate Electronic Prospects Process (SRRPREL).

You can access the Common Matching Entry Form (GOAMTCH) using the Match (GOAMTCH) item in the Options Menu to display information for a prospect ID and then execute the matching process before a new PIDM is created in Banner. SRIPREL uses GOAMTCH and the Common Matching algorithm for data load processing to determine if the incoming record matches an existing Banner record.

Use the following steps to resolve suspended records or to match and load new records from SRIPREL.

1. Query for prospect records (where the **Match Status** is *S* for “suspended”), or by other parameters.
2. If you want to view details about the selected record, choose the Details (SRAPREL) item from the Options Menu. If you want to use the matching algorithm against the selected record, then choose the Match (GOAMTCH) item from the Options Menu.
3. Before you can access GOAMTCH, you will be asked to assign an ID to the new user, either a generated ID or the person's SSN. When the data is saved, you will be taken to GOAMTCH.
4. When you enter GOAMTCH, the **ID** field will contain either the word *GENERATED* or the selected record's SSN. The **Matching Source** field will contain the matching source code that has been assigned to the interface code, which is also assigned to the electronic prospect code of the selected record on STVPREL.

If no matching source code has been assigned to the interface code, then the **Matching Source** field will contain the default matching source code that has been assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, then you will be able to select any matching source code from the List of Values.

5. Perform a Next Block to populate the Data Entry block with all of the data for the incoming prospect record that is present in the temporary tables.
6. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the prospect's record is created.
7. Perform a Next Block to run the matching algorithm. The algorithm will determine if the incoming record is new, matched, or a potential match.
8. Determine if the record is to be new or matched, and select the appropriate button.
9. The user will be automatically returned to SRIPREL. The match status will *always* be *Matched*, as the person has now been created in Banner via GOAMTCH. Continue with regular SRIPREL load processing.

The new match status, *\*Matched\**, is displayed under that person's record on SRIPREL. When you exit the form or requery against the data in the SRVPREL view, these highlighted values disappear, and the **Match Status** field is updated appropriately.

10. The Migrate Electronic Prospects Process (SRRPREL) can then be used to load those records with a match status *M* (Match) to Banner production. Or, you can use the

Create Recruit/Applicant item in the Options Menu on SRIPREL to create Banner records individually.

All fields on this form are searchable and can be used in combination to locate specific tape loads or populations.

The **Load Status** field indicates that the record for this person has already been created or updated in Banner. A person may be present on multiple search or test score tapes, so they may have multiple records in SRVPREL. This flag, if set to *C*, indicates that this record has been loaded into Banner.

The **Match Status** field displays the match status created by either the Search Tape Matching Process (SRRSRIN) or the Common Matching Entry Form (GOAMTCH), based on the rules on the Common Matching Rules Form (GORCMRL).

This form also allows you to perform the following three tasks:

1. For a selected record, use the Detail item in the Options Menu to access the Electronic Prospect Detail Form (SRAPREL) to view the detailed search or test score tape data for the person.
2. Use the Match item in the Options Menu to access the Common Matching Entry Form (GOAMTCH) to determine if this person already exists in Banner, and then match the person.
3. Use the Create Recruit/Applicant item in the Options Menu to create or update the following Banner records for a person who is either new or has been matched to a Banner record.
  - SPAPERS - demographic information
  - SPAIDEN - address information
  - SPATELE - telephone information
  - GOINTL - international information
  - SOAPCOL - prior college information
  - SOAHSCH - high school information
  - SRARECR - source and contact information
  - SOATEST - test scores (for test score tapes only, including percentiles for SAT and GRE files)
  - SAAADMS - application information
  - SOASUPL - applicant supplemental information, for AMCAS only

## Common Matching Entry Form (GOAMTCH)

If Common Matching is turned on (on GUAINST), and the user is not excluded from Common Matching on GORCMUS, GOAMTCH is called automatically from the Key Block of SPAIDEN, SRAQUIK, SAAQUIK when an ID is generated or entered, and the ID does not already exist in Banner. Whether or not Common Matching is turned on, the user will access GOAMTCH from SRIPREL, SAAEAPS, and SHAEDIS as part of the matching process for data loads.

You can enter information for name, address, telephone, date of birth, SSN, etc., in the Data Entry block. The data entered can be used to assist with matching if the matching rule contains the field being entered. Regardless, the data entered in the Data Entry block will be stored in Banner if the person is found to be new.

The matching process is called when you perform a Next Block from the Data Entry block or select the **Duplicate Check** button. Use the **Duplicate Check** button to execute the matching process at any time during the entry of person information. Only those data elements in this form can be used for online matching rules.

The Match block is automatically displayed after the matching process is completed if a match is found. This block is accessed using Next Block or the Match tab. The data entered remains in the Data Entry block. You can choose to clear the Match information using the **Clear** button. You will then be returned to the Data Entry block. The address information in the Match block displays the address type and address data, if the address was matched as part of the matching algorithm.

The Potential Matches block displays the potential matches (formerly known as suspense records) found during the search. The number of records found is displayed in parentheses in the tab, i.e., "Potential Matches (42)". You can scroll through the potential match records to see the information in each that potentially matches the information in the Data Entry block.

Logical sort order processing can be used to sort the matching results dynamically by ID or name in ascending or descending order using the **Sort** up and down arrow buttons for the **ID** and **Name** fields. The default sort order is by ID and priority (in descending order).

When you click on the **Sort** up arrow, the sort organizes the results in alpha order (A - Z). When you click on the **Sort** down arrow, the sort organizes the results in reverse alpha order (Z - A). Once you have clicked on an up or down arrow, you can mouse over the arrow to see the tool switch hint message, click on the arrow again, reverse its direction, and perform a new sort. For example, after you have sorted on ID or name in A - Z order (using the **Sort** up arrow), you can then click on the arrow again to change it to a **Sort** down arrow, and resort the data in Z - A order.

If any address fields are included in the matching rules being used, and a match exists on the address of a potential match, then that address will be displayed for that record. To see all address records for a selected potential match, select the **All Addresses** pulldown list.

 **Note**

If you use GOAMTCH by itself to match a person to an existing person in Banner, and the existing person in Banner has an address of the same address type (where the addresses themselves do not match), the existing Banner address will be inactivated, and the address that was entered on GOAMTCH will be inserted.

If you use SAAEAPS or SRIPREL to match a person via GOAMTCH and the same scenario exists, SRIPREL and SAAEAPS will put an end date on the existing Banner address and then insert the new address. ■

If the matching rule contains a row for telephone number and/or email address, and a match exists on the telephone number or email address of a potential match, then the phone number and/or email address will be displayed. The date of birth and gender will be displayed for any potential match if they exist in Banner for the potentially matched record, regardless of whether date of birth or gender are used in the matching rule.

The **Matching Rule Sets** field displays the result of the matching algorithm for each field included in the matching rule. This allows a user to know what data elements the matching rule was using, even if they do not have access to the Common Matching Rules Form (GORCMRL).

## Electronic Prospect Load (SRTLOAD)

This process uses a C program to load data from a search input file (for example, College Guide/SSS, or Peterson) or a test score report file (for example, SAT, ACT, GRE, or AMCAS), to the following temporary tables:

- SRTIDEN
- SRTPERS
- SRTTELE
- SRTADDR
- SRTTEST
- SRTPREL
- SRTHSCH
- SRTPCOL
- SRTEMAL
- SRTGPAT
- SRTCRSS

- SRTSUPL
- SRTDEGR
- SRTMAJR
- SRTTSPC
- SRTPRAC

The data in these tables is available using the Search Tape View (SRVPREL) or SRAPREL. Detail is also available when accessing these loaded records on SRIPREL using the Detail [SRAPREL] item in the Options Menu. The SRTLOAD process also creates an audit report detailing the status of each record on the input file.

This process can be used to load positional files (SAT, GRE, etc.) and delimited files (AMCAS). It reads delimited input files based on whether rules for file delimiters or delimiters/markers exist in the SORDLIM table for a given tape code. The process will either look for the fields by position or by sequence number as defined on SRATPF in the SRRTPFD\_START\_POS field. The process refers to the STVTEC\_TESC\_CODE\_DATE\_ORIGIN field for test codes.

You should do the following in preparation for running SRTLOAD:

1. If the input file is delimited, set up the delimiter (and optionally the marker) on SORDLIM for the tape code being used.
2. Set up the corresponding interface (INFC) code and tape code values on STVPREL.
3. Assign the appropriate matching source code to the interface code on STVINFC.
4. Set up rules on SOTCNVT for the conversion of the tape values to the Banner validation table values.

The codes listed below are compared to SOTCNVT for conversion to Banner values and for default values.

If the code on the tape is blank, an asterisk ( \* ) value is matched against SOTCNVT. If the tape value is not blank, the incoming value is matched against SOTCNVT. If there is no available conversion for the tape value or the tape value is not valid on the Banner validation table, the literal DEFAULT is matched against SOTCNVT. If this value is not available, then an error message is printed on the report.

On SOTCNVT, the following tables are validated:

- NATN
- CITZ
- STAT

- INTS
- INTP (PSAT only)
- ETHN
- ETHR (AMCAS only)
- RACE (AMCAS only)
- DEGC
- DEGA (AMCAS only)
- MAJR
- MAJP (PSAT only)
- RELG
- CNTY
- TADM
- TERM
- DEPT
- VTYP
- EDLV
- EGOL
- ADMT (AMCAS only)
- TEAC (AMCAS only)
- TEFR (AMCAS only)
- SBGI (college code conversions)
- SBGH (high school code conversions)
- HGPA (SAT only)
- CAMP
- ESEL
- GNDR
- TESC
- TSPT

 **Note**

The table value of *GNDR* should be used on SOTCNVT to convert various gender formats on incoming tapes to the appropriate Banner

values. *GNDR* works on *SOTCNVT*, even though it does not have a corresponding validation table. ■

The exceptions for determining conversions and default values are for the major code, interest code, term code, level code, campus code, contact type code, source code, address type code, email type code, and telephone code. *SRTLOAD* will appropriately analyze the high school or prior college graduation date on the incoming file against rules on *SOTCNVT* to determine the term code, or it will use the term code entered in the *SRTLOAD* Term Code parameter.

If there is no match, the value from the Term Code parameter is used. The level code, address type code, telephone type code, and email code that is inserted will always be from the input parameter value. If no source code or contact type code are entered in the input parameters, the value from *STVINFC* for the interface will be used. In addition, the test score source inserted on test scores will be the one created on *STVINFC*.

The fields *INTS* and *MAJR* can have multiple values in multiple fields for some types of tape loads. The asterisk ( \* ) and *DEFAULT* functionality will only work on the first match attempt for the field *MAJR*(*MAJR1*). If there are values in fields *MAJR2*, *MAJR3*, or *MAJR4*, the process will attempt to match the values against the *SOTCNVT* crosswalk and the values in *STVMAJR*. If no match is found for these, the output report will display an error indicating the field and the error. *INTS* will not use the asterisk ( \* ) or the *DEFAULT* functionality due to the possibility of many records existing on the incoming data file.

High school codes can be converted using the *SBGH* validation on *SOTCNVT*. If there is no high school conversion on *SOTCNVT*, the *STVSBGI* code will be used if there is a match. Non-high school codes cannot be entered using the *SBGH* validation on *SOTCNVT*. Colleges codes can be converted on *SOTCNVT* with *SBGI* validation, and if a code exists in *STVSBGI*, that code will be loaded.

The default values on *SRAPRED* are used when there are no *SOTCNVT* values *and* if the corresponding parameter on *SRTLOAD* is blank. When there are no *SOTCNVT* values and if the corresponding parameter on *SRTLOAD* is blank, *SRTLOAD* will first use the data that exists on the incoming tape for such fields as Term, Major, etc. If no value exists on the file, and the value does not convert on *SOTCNVT*, then *SRTLOAD* will use the data in the parameter. If no value exists in the parameter, *SRTLOAD* will use the value on *SRAPRED*. The Test Source will default in from *STVINFC*. The Tape Source and Contact Type fields will be populated from *STVINFC* if there are no corresponding *SRTLOAD* parameter values. If no values exist on *STVINFC*, the values will default from *SRAPRED* where appropriate.

Run the process in audit mode to determine which values are missing from Banner (i.e., high school codes, major codes, etc.). If these values are not created in Banner and converted using *SOTCNVT* where appropriate, the value will not be loaded into Banner.

When data is loaded to Banner, the load hierarchy is as follows:

1. Values from SOTCNVT will be loaded first, if they exist.
2. Values from the SRTLOAD parameters will be loaded second, if they have been entered.
3. Values from STVINFC (contact type and/or source code) will be loaded third, if they exist, and if valid parameter values do not exist on SRTLOAD.
4. Values from SRAPRED will be loaded fourth, if they exist.

 **Note**

For AMCAS, the student type will always need to be updated on SRAPRED for the level for which you are running SRTLOAD, so the required Student Type value is loaded for the applicant. ■

When matching nation codes, if no code exists on the tape and a nation description is provided, the nation description will be compared against the nation description in STVNATN. If there is an exact match, the nation code will be updated in the SRTNATN temporary table and can be loaded to Banner.

For example, when no SOTCNVT rules exist for STVNATN and the nation description is provided on the tape:

- Nation *Singapore* on tape will be translated and update SRTADDR\_NATN\_CODE = 133 when STVNATN code 133 = *Singapore*.
- Nation *Mexico* on tape will be translated and update SRTADDR\_NATN\_CODE = 99 when STVNATN code 99 = *Mexico*.
- Nation *Albania* on tape will be translated and update SRTADDR\_NATN\_CODE = 2 when STVNATN code 2 = *Albania*.
- However, *Bahamas* on tape would not be translated, as STVNATN code 10 = *The Bahamas*.

 **Note**

The nation code will be loaded to Street Line 3, and there will be associated API errors because of the nation and the state. The record would need to be resolved manually on GOAMTCH prior to loading. ■

Also, SRTLOAD will provide the following messaging based on the above examples:

<b>Data Item</b>	<b>Nation Code</b>	<b>Message</b>
NATN	99	<i>Nation found from description</i>
NATN	2	<i>Nation found from description</i>
NATN	133	<i>Nation found from description</i>
NATN	BAHAMAS	<i>Not In SOTCNVT, STVNATN</i>

## Loading User-Defined Activity Codes

The college interest information is delivered on the SAT tape file in positions 922-942. A single activity determined by the College Board is represented in each of the 22 positions on tape.

When the SRTLOAD process is run, it looks at each of the 22 positions to determine if they are *on* or *off*. Each position represents a particular activity; for instance ART will always be represented in position 922. SRTLOAD is hardcoded to interpret the activities in each of these positions and convert the value on tape to a corresponding activity code delivered by SunGard Higher Education in STVINTS.

For instance, SRTLOAD interprets the interest code that represents ART in position 922 as *AH* and loads *AH* to the Temporary Interests Table (SRTINTS). These are the activity codes that will ultimately be loaded to Banner. These activity codes are maintained on STVINTS.

You have the option to use your institution-defined activity codes in STVINTS and have them loaded into Banner, rather than having the Banner baseline activity codes loaded by SRTLOAD. This allows you to convert the delivered interests that SRTLOAD uses for each activity to an institution-defined activity from STVINTS on the Tape Code Conversion Form (SOTCNVT). Your institution's validation values will then be loaded to Banner.

### **Note**

Field names and positions will not change on SRATPFD for the SAT tape file. The Banner baseline activity codes that SRTLOAD uses for the SAT tape must remain in STVINTS. The only change necessary to accommodate this modification is to update SOTCNVT. ■

For example, on the SAT tape, position 922 represents ART. In SRATPFD for the **Tape Code** value SAT, the **Field Name** value for position 922 is AH\_INTS\_CODE.

The *AH* represents the activity code that is loaded to Banner if the student has marked position 922 on the tape. The field names for positions 922-942 incorporate the activity code used.

 **Note**

Position 942 equals *NONE OF THE ABOVE*, and SRATPFD does not look at this position. ■

If you prefer to use your own interest code for ART in STVINTS rather than *AH*, then the *AH* can be converted to a value of your choice on SOTCNVT. In this case, the **Tape Value** on SOTCNVT is the Banner-delivered activity code that represents the activity on tape.

Below is an example of how to set up SOTCNVT to convert three of the activity codes: *AH* (ART), *AA* (Intramural Sports), and *AB* (Varsity Sports) to the institution-defined interests of *AR*, *IS*, and *VS* respectively. The **Interface Type** is *SAT*, and the **Validation Table Name** is *INTS*.

Table Name	Tape Value	Conversion Code	Description
INTS	AH	AR	Art
INTS	AA	IS	Intramural Sports
INTS	AB	VS	Varsity Sports

Codes that are not converted in this manner will still be loaded with the hard-coded values.

## SRTLOAD Process Results with PIDM

The Electronic Prospect Load (SRTLOAD) checks the data file for the PIDM based on the start and end positions that are defined on SRATPFD. If a PIDM exists in the file, SRTLOAD compares the PIDM on the tape to the value in the *SPRIDEN\_PIDM* field.

If SRTLOAD finds a matching PIDM in Banner, the *SRTIDEN\_MATCH\_STATUS* field is updated to a status of matched, and the *SRTIDEN\_DATE\_MATCHED* field is also updated accordingly. SRTLOAD only prints PIDM information on the report if there is a PIDM found on the tape. A total of matched PIDMs appears at the end of the report.

### Tape PIDM Matches Banner PIDM

When SRTLOAD determines that the PIDM on the tape *matches* a PIDM in Banner, SRTLOAD prints the corresponding matched/existing Banner ID on the report. The First Name, Middle Name, and Last Name *from the tape* print next to the actual Banner ID.

A message also prints indicating that the *PIDM ON TAPE MATCHES* *SPRIDEN\_PIDM AS* *SPRIDEN\_FIRST\_NAME, SPRIDEN\_LAST\_NAME*. (*SPRIDEN* First and Last Name are the actual Banner First and Last Name associated with the matched PIDM.)

## Tape PIDM Does Not Match Banner PIDM

When SRTLOAD determines that the PIDM on the tape *does not* match a PIDM in Banner, a message prints on the report indicating that the *PIDM ON TAPE DOES NOT MATCH* SPRIDEN\_PIDM. Run the Electronic Prospect Match (SRRSRIN) to determine a match status on the remainder of records with no matched status, or match them manually using the Electronic Prospect Inquiry Form (SRIPREL) and the Common Matching Entry Form (GOAMTCH).

When all matching is completed, run the Migrate Electronic Prospects Process (SRRPREL) to load the records to Banner, or load them manually using SRIPREL and GOAMTCH.

## Matching on Middle Name

When a prospect is pushed to Banner (SRRPREL) that is a match and where the Banner SPRIDEN record has a *NULL* middle name, if the incoming prospect has a middle initial/name, a new Banner SPRIDEN record is generated. The process keeps the existing ID, inserts the new middle name information, creates an alternate SPRIDEN record with the original name, and updates Name Change Indicator.

### Note

An alternate ID with the same name as the current SPRIDEN record is allowed and will not cause API errors when a unique name type is included as part of the alternate ID. ■

When data is loaded to Banner, several checks are made to accommodate the loading of the middle name or middle initial. When the current SPRIDEN record matches an alternate (including the name type), and the current SPRIDEN middle name is *NULL*, the incoming record with the new middle name will not cause an API error, but it will not be loaded.

### Note

An alternate ID with the same name as the current SPRIDEN record is allowed and will not cause API errors when a unique name type is included as part of the alternate ID. ■

Middle name or middle initials will be loaded when:

- An incoming matching prospect has a middle name or middle initial, the current SPRIDEN middle initial is *NULL*, and no alternate IDs exist with the same incoming middle initial or middle name and/or the same first character of the incoming middle initial or middle name.
- An incoming matching prospect has a middle name or middle initial, the current SPRIDEN middle initial is *NULL*, and alternate IDs exist with a different middle initial or middle name.

## Student Search Service Tape Load and SRTLOAD

The College Board Student Search Service (SSS) is combining the SAT majors and the PSAT/NMSQT majors onto a single tape beginning in July 2003.

### SAT and PSAT/NMSQT Majors

Currently, the College Board Student Search Service (SSS) tape is delivered to clients in two different ways. Either it is delivered with between one and five SAT majors listed in positions 156-170 or a single PSAT/NMSQT major code in positions 156-158. Since the delivered SAT and PSAT/NMSQT major codes are converted differently, two sets of conversion codes on STVINFC and conversion rules for majors on SOTCNVT are needed to process each SAT version or the PSAT/NMSQT version of the tape.

As of July 2003, the College Board Search Service (SSS) will deliver the SAT and PSAT/NMSQT majors on a single tape. The five possible SAT major codes will remain listed in positions 156-170. The single PSAT major will be listed in positions 248:250. These positions had previously been blank.

While this processing is available in Banner, it will not impact your current processing of the separate SAT or PSAT/NMSQT tapes. As of July 2003 when you begin to receive the new format (or when you decide to begin your testing), you can change one of your existing conversion rules on SOTCNVT to accommodate the single tape, or you can create a completely new conversion rule.

### Using Tape Code SSS\_SEARCH

Use the tape/file field name *MAJR\_PSAT* for the PSAT/NMSQT major on the Tape Field Names Validation Form (STVTPFD). The description is *PSAT Major*.

The SAT majors (*MAJR\_CODE*, *MAJR\_CODE2*, *MAJR\_CODE3*, *MAJR\_CODE4*, *MAJR\_CODE5*) remain in positions 156-170. Use the tape field name *MAJR\_PSAT* on the Tape Field Position Rule Form (SRATPFDF). *MAJR\_PSAT* uses positions 248-250.

The Temporary Electronic Prospects Table (SRTPREL) can accommodate the five SAT major codes and the PSAT major code. The temporary tables are populated when SRTLOAD is run.

Because the PSAT majors are converted differently than SAT majors and will be delivered on a single tape, dummy validation table names are used on the Tape Code Conversion Form (SOTCNVT) so the major codes are converted properly from PSAT majors, and interest codes are converted properly from PSAT majors. These dummy validation table names are: *MAJP* (used to convert PSAT majors) and *INTP* (used to convert PSAT majors to interests).

The *MAJP* and *INTP* validation table names are not validated on SOTCNVT. The four character table name is loaded to a variable used to execute the conversions. For data entry purposes, validation (List of Values) against the dummy validation table names on

SOTCNVT will call the Banner validation tables STVMAJR and STVINTS, which contain your institution's major and interest values. *MAJP* will validate on STVMAJR. *INTP* will validate on STVINTS.

To translate the SAT majors and interests, you will need to create rules on SOTCNVT for the *MAJR* and *INTS* validation table names.

For example, a sample of data for SAT majors and conversions could appear as follows:

<b>Interface Code</b>	<b>Validation Table Name</b>		
SEARCH	MAJR		

<b>Table</b>	<b>Tape Data</b>	<b>Banner Conversion Code</b>	<b>Description</b>
MAJR	108	DASC	Dairy Science
MAJR	350	ACCT	Accounting

A sample of data for SAT interests and conversions could appear as follows:

<b>Interface Code</b>	<b>Validation Table Name</b>		
SEARCH	INTS		

<b>Table</b>	<b>Tape Data</b>	<b>Banner Conversion Code</b>	<b>Description</b>
INTS	108	AD	Agriculture/Dairy Science
INTS	350	FA	Finance/Accounting

To translate the PSAT majors and interests, you will need to create rules on SOTCNVT for the *MAJP* and *INTP* validation table names.

For example, a sample of data for PSAT majors and conversions could appear as follows:

<b>Interface Code</b>	<b>Validation Table Name</b>		
SEARCH	MAJP		

<b>Table</b>	<b>Tape Data</b>	<b>Banner Conversion Code</b>	<b>Description</b>
MAJP	130	AGRO	Agronomy
MAJP	280	ENGR	Engineering

A sample of data for PSAT interests and conversions could appear as follows:

<b>Interface Code</b>	<b>Validation Table Name</b>
SEARCH	INTP

<b>Table</b>	<b>Tape Data</b>	<b>Banner Conversion Code</b>	<b>Description</b>
INTP	130	AY	Agronomy
INTP	280	EN	Engineering

When the Electronic Prospect Load (SRTLOAD) is processing the SSS\_SEARCH tape and finds the table field name *PSAT\_MAJOR* on SRATPF, it will use the *MAJP* validation table and/or the *INTP* validation table during the conversion of PSAT majors and interests based on your institution's rules on SOTCNVT. SAT majors will be converted from the *MAJR* and *INTS* validation tables based on your institution's rules on SOTCNVT.

The Electronic Admissions Application Rules Form (SAAERUL) contains a delivered rule for use *only* with the SSS\_SEARCH tape. The rule is for the *PREL* group code and the *PSATMAJOR* label and has values of *Y* or *N*.

Group	Label	Description	EDI	Instructions
PREL	PSATMAJOR	Load the PSAT Major First	N	<p>Loads the PSAT major if it exists on tape. This rule is only used for SSS_SEARCH tape processing.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>Y</i>, and the PSAT exists on tape, the PSAT major will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR). The first SAT major code listed on tape will then be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR) if it exists.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>N</i>, the PSAT major will not load at all, and the first two SAT major codes on tape will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR) and a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR), if they exist on the tape.</p> <p><b>Note:</b> Whatever your settings are in SAAERUL, if the second major to be loaded translates to 0000 (undeclared), the second major will not be loaded.</p>

Interests will continue to be loaded and translated for all majors based on your institution's rule settings on SOTCNVT and your *MAJOR2INTEREST* and *INTERESTMAX* rule settings on SAAERUL.

 **Note**

If *LOADMAJOR* is set to *Y*, *PSATMAJOR* is set to *N*, *MAJOR2INTEREST* is set to *Y*, and there is a PSAT major on tape that meets your conversion rules, then the PSAT major will still be loaded to the SRTPREL temporary table and will be converted to an interest. However, SRRPREL will not load the PSAT major to the RECRUIT Major 1. If *MAJOR2INTEREST* is

set to *N*, no majors will be translated, regardless of your rules. Also, *INTERESTMAX* will need to be set accordingly. ■

## Electronic Prospect Match (SRRSRIN)

Run this process to determine if a match exists between a record on the Search Tape View (SRVPREL) and Banner production data when search, test score tape, or AMCAS records are loaded in mass. Users should review how Common Matching works with electronic prospect processing when using SRRSRIN and SRRPREL.

The process uses the interface code, its corresponding matching source code, and the rules established on the Common Matching Rules Form (GORCMRL) to determine if a record on SRVPREL has a match in Banner. The process runs against all records in SRVPREL that have a match status of null and a load status of null. This assumes that if you change the matching rules on GORCMRL, you are not able to re-match someone on SRVPREL who has already been matched, because the person's match status will no longer be null. This process sets the match status on SRVPREL to either *N* (New), *M* (Matched) *S* (Suspense), *D* (Duplicate), or *E* (Error). The *S* and *D* records can be viewed and updated on the Common Matching Entry Form (GOAMTCH) which is accessed from the Electronic Prospect Inquiry Form (SRIPREL).

SRRSRIN will mark tape records as duplicates (*D*) when it finds matching information for the same tape ID. Duplicates can result from having multiple records delivered on a single tape for a student. Students can submit more than one request to send a report to your institution within the same reporting period. Students may also take a test more than once and not provide consistent identifying information. Duplicates can also result if SRTLOAD is run more than once with the same tape ID, and the matching process is not executed between loads.

### **For example:**

1. Records are loaded by SRTLOAD with electronic prospect code *SAT* and tape ID of *sat1*.
2. For some reason the matching process is not run, and the records not purged. They remain unprocessed in the temporary tables.
3. SRTLOAD is run again for the same tape electronic prospect code *SAT* and tape ID of *sat1*.
4. When the matching process is run, each of the IDs can be flagged as duplicate.

### **Using the Auto Load Parameter**

The Auto Load (Skip Dup Chk) parameter allows you to choose whether to flag duplicates on a tape or skip the duplicate checking process to reduce the number of duplicates that would need to be handled manually on SRIPREL.

Duplicates are flagged by SRRSRIN when the temporary tables contain records having the same name and date of birth for the prospect code and/or tape ID chosen as parameter values when running SRRSRIN.

SRRSRIN may find duplicates in the following circumstances:

- Single tapes may report the same individual more than once for the prospect code/tape ID.
- Individual tapes may be loaded to the temporary tables multiple times using the same prospect code and/or tape ID.
- Multiple tapes for the same prospect code could be loaded to the temporary tables with the same tape ID, and the same name could appear across multiple tapes.
- Web prospects having the same prospect code, name, and date of birth could be loaded to the temporary tables.

The Auto Load (Skip Dup Chk) parameter is used to bypass the flagging of duplicates by SRRSRIN and to automatically load records to Banner. Auto load processing replaces the manual processing of matching and loading those duplicates on SRIPREL.

When the Auto Load (Skip Dup Chk) parameter is set to *Y*, the matching process is invoked, and *NEW* or *MATCHED* prospects are flagged. Those prospects are immediately loaded to Banner. Duplicate checking does not occur.

When the records are loaded to Banner, each prospect that follows on the tape is evaluated against any records loaded, facilitating more matches, and preventing records from being flagged as duplicates. When the Auto Load (Skip Dup Chk) parameter is set to *Y*, records that were previously flagged as *LOADED* manually on SRIPREL for the same tape type and tape ID will not be processed by SRRSRIN.

When the Auto Load (Skip Dup Chk) parameter is set to *Y*, the SRRSRIN output file will resemble the SRRPREL output file with the information regarding the prospects that have been loaded. If SRRPREL is run after SRRSRIN is run, with the Auto Load (Skip Dup Chk) parameter set to *Y* for the same prospect code and tape ID, there will be no records processed. If all records are processed by SRRSRIN when the Auto Load (Skip Dup Chk) parameter is set to *Y*, there is no reason to run SRRPREL.

 **Note**

Suspended records or records in error may still be found when the Auto Load (Skip Dup Chk) parameter is set to *Y*. These records will need to be handled manually on SRIPREL. ■

The process works as follows:

If a tape ID selected by SRRSRIN contains multiple occurrences of John Smith with the same date of birth or SSN, then when the Auto Load (Skip Dup Chk) parameter is set to *Y*, the first occurrence of John Smith will be flagged as *NEW* (or *MATCHED*), and the record will immediately be loaded to Banner. If subsequent occurrences of the same John Smith

are evaluated on the same tape, each one will be found to be matched against the prior record for John Smith that was already loaded as *NEW* (or *MATCHED*) to Banner.

 **Note**

When the Auto Load (Skip Dup Chk) parameter is set to *Y*, the value for the Report Type parameter in SRRSRIN will be ignored.

If the Auto Load (Skip Dup Chk) parameter is set to *N*, the Report Type parameter value will be passed to SRRSRIN, and the check for duplicates on tape will occur. ■

## Duplicate Processing and the Auto Load Parameter

If the Auto Load (Skip Dup Chk) parameter is set to *N*, then duplicate processing will be run before match processing. In addition, duplicate processing performs the following checks:

1. If two records have the same SSN, they will be marked as duplicates.
2. If two records have the same first and last names and the same dates of birth, they will be marked as duplicates.

The first name match will also use any nick name data created on the Name Translation Rules Form (GORNAME), if no first name matches are found. In addition, if either of the incoming Date of Birth fields are null, but the first and last names match, a record will still be considered to be a duplicate.

## Migrate Electronic Prospects Process (SRRPREL)

This process is used to create or update Banner recruiting and admissions records for the records in the search tape temporary records, including AMCAS records, depending on how the parameters are set. SRRPREL processes all search, test score tape, and AMCAS records that have a match status of *N* (New), *M* (Matched), or *A* (All) or rows with a match status set to *M* or *N* (depending on the parameter value selected). Once a record has been loaded, its load status is set to *C*.

The source and contact codes identified as parameters on the SRTLOAD process are loaded to the new or updated recruiting or admissions records based on the values for these rules on the Electronic Admissions Application Rules Form (SAAERUL). If no values are entered for these parameters in the SRTLOAD process, the values entered on STVINFC will be used. SRRPREL allows for the update of an existing recruiting or admissions record instead of always creating a new recruiting record if you request that additional information be loaded. Default values from SRAPRED will be used if they have been set up.

Use the *CREATENEWAPPL* rule on SAAERUL for the group equal to *PREL* to create an application record at the same time a recruit record is created by SRRPREL. When this rule is set to *Y*, the `sakmods.p_create_application` package is called to create an

application record. When this rule is set to *N*, a corresponding application record is not created.

## Processing Incoming Tape Load Data

The prospect codes on STVPREL need to be mapped to interface codes on the Interface Code Validation Form (STVINFC), using the **Interface Code** field on STVPREL. If the **Interface Code** field is blank, the SRTLOAD process will not know which tape code conversion rules (defined on SOTCNVT) to use when processing the search tape records and will not run to completion.

Regardless of the rules set on SAAERUL, null fields on the General Person Form (SPAPERS) will be filled in with the appropriate data from the search or test score tape.

## Electronic Admissions Application Rules Form (SAAERUL)

This form is used to define the rules which are used when processing electronic applications, electronic prospects, and tape loads. Rows for this table are not intended to be added locally. Rules which will be used in system processing will be delivered by SunGard Higher Education, and users will only need to update the **(Rule) Value** to reflect local processing options if it contains *UPDATE ME*.

Rules fall into three major categories:

- Rules which control processing within self-service admissions, self-service prospects, or tape load processing.  
For example, there is a rule which specifies the number of outside interest slots which will display in Web applications.
- Rules which specify default values for various data elements. These kinds of rules can apply to both Web and EDI applications.
- Rules which govern how data will be loaded into the permanent Banner tables.  
For example, there is a set of rules which specifies whether application records will be created if one already exists for the person, term, level, major, or overall curriculum chosen.

Three general types of values may be required in the **(Rule) Value** field, and the **Rule Description** field will usually indicate the type of value expected.

- Simple descriptive answers, like true, false, or a number to indicate the number of values which will be available.
- A valid Banner validation table code, like an address type code.

- An EDI value which is valid within the TS189 transaction set. A complete, current listing of all codes used in the TS189 transaction set is available on the Web site <http://adm5.byu.edu/ar/aacraoig/igtoc.html>.

(When a valid EDI value is expected, the **EDI Indicator** for the rule will be *Y*).

Use the **Copy PREL Group** button to copy existing electronic prospect rules to a new group code. Once the values have been copied, the **System Required Indicator** defaults to *N* or unchecked, so you can customize the group settings. This allows users to customize the electronic prospect code rules based on each electronic prospect code used, instead of the same set of values applying to all electronic prospect codes.

For example, if an electronic prospect code of *SAT* exists and you want it to be processed differently based on the rules for a group code of *PREL* on *SAAERUL*, then do the following.

1. Define a new group code on the EDI Rule Group Validation Form (STVEGRP) for *SAT*. (The new group code must match the electronic prospect code).
2. Enter *SAT* in the **Group** field on *SAAERUL*.
3. Select the **Copy PREL Group** button. All of the rules that exist for the *PREL* group code will be copied to your new *SAT* group code.
4. You can customize those values, and they will be applied only when the electronic prospect code used on *SRTLOAD*, *SRRSRIN*, or *SRRPREL* is *SAT*.

## Rules on *SAAERUL*

The rules on the Electronic Admissions Application Rules Form (*SAAERUL*) with the **Group (Code)** *PREL* allow you to set up default values for such things as an unknown high school and to control the migration of the data.

### New Recruit Data

Rules are used for determining under what circumstances recruiting records, addresses, and phone numbers will be loaded. For the rule label *CREATENEWRECR* (no recruit exists, create new recruit), the possible values are *Y* or *N*. When an incoming record is being loaded and matched to an existing Banner person, the code will check if a recruiting record already exists for the person. If none does, then the code will check the *CREATENEWRECR* rule. If the rule value is *Y*, then the incoming data will be used to create a recruiting record. If the rule value is *N*, then no recruiting record will be created.

The two other rules used for creating a recruiting record are *MCREATENEWRECR* (matching recruit exists, create new recruit) and *NMCREATENEWRECR* (non-matching recruit exists, create new recruit).

- The possible values for *MCREATENEWRECR* are *Y*, *N*, or *U* (Update). If an incoming record is being loaded, the program will determine if a matching

recruiting record already exists. An existing recruiting record matches if it has the same term, level, and optionally campus.

- If the incoming record matches the existing recruiting record, and the *MCREATENEWRECR* rule value is *Y*, then a new recruiting record will be created.
- If the *MCREATENEWRECR* rule value is *U*, then no new recruiting record will be created, and instead, the existing recruiting record will be updated.
- If the *MCREATENEWRECR* rule value is *N*, then no recruiting record will be added, and the existing recruit record will not be updated.
- The possible values for *NMCREATENEWRECR* are *Y* or *N*. If an incoming record is being loaded, and it does not match to an existing recruiting record (based on term, level, and optionally campus), then the code will check the *NMCREATENEWRECR* rule to determine whether or not to create a new recruiting record.

## New Address Data

The rule label *NEWADDRESS* (no address exists, create one) is used when no address currently exists for the person in Banner. The possible values are *Y* or *N*. If the rule value is set to *Y* and no address currently exists for the person, the incoming address will be loaded.

The two other rules used for creating an address record are *ADDRDIFFTYPE* (address exists with different address type, add address) and *ADDRSAMETYPE* (address exists with same address type, add address). The possible values for these rules are *Y* or *N*.

- If an address already exists in Banner, and the incoming address record has the same address type, the address record will be inserted if the *ADDRSAMETYPE* rule value is *Y*.
- If the incoming address record has an address type that differs from the existing Banner address record, and the *ADDRDIFFTYPE* rule value is *Y*, then the incoming address record will be loaded. If the *ADDRDIFFTYPE* rule value is *N*, it will not be loaded.

## New Phone Data

The rule label *NEWPHONE* (no phone exists, create one) is used when no phone number currently exists for the person in Banner. The possible values are *Y* or *N*, where *Y* creates a new phone number, and *N* does not create a new phone number.

The two other rules used for creating a phone record are *PHONDIFFTYPE* (phone number exists with different phone type, add phone) and *PHONSAMETYPE* (phone number exists with same phone type, add phone). The possible values for these rules are *Y* or *N*.

- If a telephone record already exists in Banner, and the incoming telephone record has the same phone type, the phone number will be inserted if the *PHONSAMETYPE* rule value is *Y*.
- If the incoming phone record has a phone type that differs from the existing Banner phone type, and the *PHONDIFFTYPE* rule value is *Y*, then the incoming phone number will be loaded. If the value is *N*, it will not be loaded.

## Web for Prospects Phone and Address Data

Web for Prospects allows users to enter extra phone numbers in Banner Student Self-Service that are not associated with a specific address. If extra phone numbers are entered by prospects on the Web, they will be processed in conjunction with address/phone data as follows:

1. The primary address (Address 1) is loaded to Banner along with its associated phone number using the electronic prospect rules identified above.
2. The secondary address (Address 2), if it exists, is loaded to Banner along with its associated phone number using the electronic prospect rules identified above.
3. The extra phone numbers entered are processed one at a time, based on the alphabetical order of the telephone type, using the electronic prospect rules identified above.

### **For example:**

- *NEWPHONE* = *Y*
- *NEWADDRESS* = *Y*
- *PHONSAMETYPE* = *N*
- *PHONDIFFTYPE* = *Y*

The person being loaded is new to Banner and has entered a mailing address and phone number. In addition, they have entered a separate “mailing” phone number and a “business” phone number. When the record is processed, the mailing address and phone number will be loaded, because the *NEWADDRESS* and *NEWPHONE* rules are both set to *Y*.

Next, the business phone number will be processed, because it falls first alphabetically based on the phone type. The business phone number will be loaded, because it is a different type than the already processed mailing phone number, and the *PHONDIFFTYPE* rule is set to *Y*. The mailing phone number will then be processed. It will also be loaded to Banner, because it is a different type than one of the existing Banner phone numbers (the business phone that was just processed), and the *PHONDIFFTYPE* rule is set to *Y*.

## List of Rules

The rules on the Electronic Admissions Application Rules Form (SAAERUL) with the **Group (Code)** of *PREL* allow you to control how the incoming data is processed. Please see the table of rules that follows.

### Note

Rows for this table are not intended to be added locally. Rules which will be used in system processing will be delivered by SunGard Higher Education, and users will only need to update the **(Rule) Value** on SAAERUL to reflect local processing options. ■

Please refer to the “Loading Packages/Procedures from Temporary to Production Tables (SRKPREL) Process Flows” section of the “Process Flows” chapter to review process flows describing how recruiting data is loaded and updated.

Group	Label	Description	EDI	Instructions
DISP	WEBPTESTDISP	# of Prospects Test Rows	N	Determines the number of test score rows that will display on the Web for Prospects Web page.
PREL	ACTADMR	Default ADMR code for ACT	N	Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).  This default is only used for ACT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESSC) for ACT test code record types.
PREL	ADDRDIFFTYPE	Create address if different type	N	Determines if an address should be created, if one with a different address type already exists. If set to <i>Y</i> , an address record will be created. If set to <i>N</i> , no address record will be created.
PREL	ADDRSAMETYPE	Create address if same type	N	Determines if an address should be created, if one with the same address type already exists. If set to <i>Y</i> , a new address record will be created. If set to <i>N</i> , no address record will be created.

Group	Label	Description	EDI	Instructions
PREL	COMMPLAN	Create commplan collector entry	N	If set to <i>Y</i> , a record will be inserted into the Communication Plan Collector Table (SORCCOL) which is visible on the Communication Plan Collector Form (SOACCOL).
PREL	CREATECONT	Create new contact if recruit or app.	N	<p>If set to <i>Y</i>, the contact code entered as a parameter on the SRTLOAD process for tape load or the contact code listed on the Electronic Prospects Default Options Form (SRAPRED) for electronic prospects will be inserted into the SORCONT table viewable on the Recruit Prospect Information Form (SRARECR) if a recruit record exists and the Admissions Application Form (SAAADMS) if an application record exists.</p> <p>If no contact code was loaded via SRTLOAD, and this parameter is <i>Y</i>, the system will insert the contact code for the appropriate interface code from the Interface Code Validation Form (STVINFC). The appropriate contact code will be loaded each time the recruit is loaded to Banner.</p> <p>If set to <i>N</i>, a contact code will not be created for new recruit records.</p>
PREL	CREATELEARNED	Create learned: Enter Y or N	N	If <i>Y</i> is entered, and if the prospect is new to Banner, or if the prospect is matched to a recruit, and the recruit term, level, and campus are different, then the How I Learned data is created. The learned information will always be created if the prospect is matched to an applicant and the <i>UPDATEIIFAPP</i> is <i>Y</i> , or if the prospect is matched to a recruit with same term, level, and campus. The learned data is entered only on the Web.

Group	Label	Description	EDI	Instructions
PREL	CREATEMATERIALS	Create Materials: Enter Y or N	N	If <i>Y</i> is entered, and if the prospect is new to Banner, or if the prospect is matched to a recruit, and the recruit term, level, and campus are different, then the materials data are created. The materials will always be created if the prospect is matched to an applicant and the <i>UPDATEIIFAPP</i> is <i>Y</i> , or if the prospect is matched to a recruit with same term, level, and campus.
PREL	CREATENEWAPPL	Create New Application	N	Allows schools to indicate that they want an application record created at the same time a recruit record is created by <i>SRRPREL</i> .  <b>Note:</b> When this rule is <i>Y</i> , a new application will only be created when the term, level, college, degree, department, and/or major do not match an existing application.
PREL	CREATENEWRECR	Create new recruit	Y	If set to <i>Y</i> and no recruit record exists, a new recruit record will be created. If set to <i>N</i> and no recruit record already exists, then a new recruit record will not be created.
PREL	CREATESRCE	Create new source	Y	If set to <i>Y</i> , the source code entered as a parameter on the <i>SRTLOAD</i> process for tape load or the source code listed on the Electronic Prospects Default Options Form ( <i>SRAPRED</i> ) for electronic prospects will be inserted into the <i>SRRRSRC</i> table viewable on the Recruit Prospect Information Form ( <i>SRARECR</i> ). If no source code was loaded via <i>SRTLOAD</i> , and this parameter is <i>Y</i> , the system will insert the source code for this from the Interface Code Validation Form ( <i>STVINFC</i> ).

Group	Label	Description	EDI	Instructions
PREL	GMATADMR	Default ADMR code for GMAT	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for GMAT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESC) for GMAT test code record types.</p>
PREL	GREADMR	Default ADMR code for GRE	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for GRE tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESC) for GRE test code record types.</p>
PREL	HOMESCHOOL	SBGI code, if the prospect checks the <b>Home School</b> checkbox on Web for Prospects Web page	N	<p>This applies only to the Web. The value entered on SAAERUL for this must be a valid high school on STVSBGI.</p>
PREL	HSCHADMR	Default High School Checklist	N	<p>This value will be used to populate the <b>Admissions Request</b> field on the High School Information Form (SOAHSCH). This default is <i>only</i> used when the Admissions Request value is not populated on the Source/Background Institution Code Validation Form (STVSBGI).</p>

Group	Label	Description	EDI	Instructions
PREL	HSCHSELFREPORT	Update self-reported items	N	If set to <i>Y</i> , then the student self-reported items, such as GPA, class rank, etc., will be loaded to the appropriate tables.
PREL	INTERESTMAX	Maximum interest to load	1	Indicates the number of interests to be loaded from a search tape to the SORINTS table if the <i>LOADINTEREST</i> group label is set to <i>Y</i> .
PREL	LOADINTEREST	Load interests	N	If set to <i>Y</i> , interests provided on the tape will be loaded to the SORINTS table. All interest codes must have Banner conversion values defined on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of INTS.
PREL	LOADMAJOR	Use provided major	N	If set to <i>Y</i> , majors provided on the tape will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR) and to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR). All tape major codes must have Banner conversion values defined on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of MAJR.
PREL	LOADOLDTESTS	Load older test scores	N	If set to <i>Y</i> , test score records with test dates older than the current record's scores will also be loaded.
PREL	MAJOR2INTEREST	Load major to interests	N	If set to <i>Y</i> , and <i>LOADINTEREST</i> is set to <i>Y</i> , major codes provided on the tape will be loaded to the SOTINTS table. All tape major codes must have Banner conversion values set appropriately on the Tape Code Conversion Form (SOTCNVT) for the <b>Validation Table Name</b> of INTS.

Group	Label	Description	EDI	Instructions
PREL	MCREATENEWRECR	Matching create new recruit	N	<p>If set to <i>Y</i>, and the incoming record matches an existing recruiting record, then a new recruiting record is created.</p> <p>If set to <i>U</i>, and the incoming record matches an existing recruiting record, then no recruiting record is created, and the existing record is updated. If a matching recruiting record exists, and the incoming contact, source, and/or interests are different, those values are updated.</p> <p>If set to <i>N</i>, and the incoming record matches an existing recruiting record, then no recruiting record is created, and no records are updated.</p> <p>A match exists if the incoming record has the same term, level, and optionally campus as the existing recruiting record.</p>
PREL	NEWADDRESS	Create address	Y	<p>If set to <i>Y</i>, and no address record exists for the person in Banner, an address record will be created. If set to <i>N</i>, and no address record exists, no record will be created.</p>
PREL	NEWPHONE	Create phone	Y	<p>If set to <i>Y</i>, and no phone record exists for the person in Banner, a phone record will be created. If set to <i>N</i>, and no phone record exists, no record will be created.</p>
PREL	NMCREATENEWRECR	Non-match create new recruit	N	<p>If set to <i>Y</i>, and the incoming record does not match an existing recruit record, a new recruiting record is created. If set to <i>N</i>, no recruiting record is created.</p> <p>A match exists if the incoming record has the same term, level, and optionally campus as the existing recruiting record.</p>

Group	Label	Description	EDI	Instructions
PREL	PCOLADMR	Default Prior College Checklist	N	This value will be used to populate the <b>Admissions Request</b> field on the Prior College Form (SOAPCOL). This default is <i>only</i> used when the Admissions Request value is not populated on the Source/Background Institution Code Validation Form (STVSBGI).
PREL	PHONDIFFTYPE	Create phone if different type exists	N	Determines if a phone record should be created, if one with a different phone type already exists. If set to <i>Y</i> , a phone record will be created. If set to <i>N</i> , no phone record will be created.
PREL	PHONSAMETYPE	Create phone if same type exists	N	Determines if a phone record should be created, if one with the same phone type already exists. If set to <i>Y</i> , a new phone record will be created. If set to <i>N</i> , no phone record will be created.
PREL	PRIMESRCE	Create source as primary	N	If set to <i>Y</i> , and <i>CREATESRCE</i> is set to <i>Y</i> , then the source code loaded to the <i>SRRRSRC</i> table will be set as the primary source. Only one source will be flagged as primary for each recruit term and sequence number upon loading to Banner.

Group	Label	Description	EDI	Instructions
PREL	PSATMAJOR	Load the PSAT Major First	N	<p>Loads the PSAT major if it exists on tape. This rule is only used for SSS_SEARCH tape processing.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>Y</i>, and the PSAT exists on tape, the PSAT major will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR). The first SAT major code listed on tape will then be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR) if it exists.</p> <p>When <i>LOADMAJOR</i> is set to <i>Y</i> and <i>PSATMAJOR</i> is set to <i>N</i>, the PSAT major will not load at all, and the first two SAT major codes on tape will be loaded to a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>1</i> (backfilled to the Major 1 field on SRBRECR) and a field of study row with a <b>Type</b> of <i>MAJOR</i> and a <b>Priority</b> of <i>2</i> (backfilled to the Major 2 field on SRBRECR), if they exist on the tape.</p> <p><b>Note:</b> Whatever your settings are in SAAERUL, if the second major to be loaded translates to 0000 (undeclared), the second major will not be loaded.</p>

Group	Label	Description	EDI	Instructions
PREL	SATADMR	Default ADMR code for SAT	N	<p>Identifies the checklist summary request default ADMR code value to be updated in the Application Detail block of the Admissions Application Form (SAAADMS), if it exists for the record. This value will also be used to populate the <b>Admission Request</b> field on the Test Score Information Form (SOATEST).</p> <p>This default is only used for SAT tape loads and when the ADMR value is not populated on the Test Code Validation Form (STVTESC) for SAT test code record types.</p>
PREL	UNKNOWNHSCH	SBGI code, if the student enters an invalid SBGI code on the Web	N	<p>This source/background institution (SBGI) code will fill in the SRTHSCH_SBGI_CODE, and the code the student entered will fill into SRTHSCH_SBGI_CODE_INVALID. This code is also used if student leaves the SBGI code blank but enters a name of the institution or any of the self-reported data. This rule is for the Web only. The value entered on SAAERUL for this must be a valid high school on STVSBGI.</p>
PREL	UNKNOWNPCOL	SBGI code, if the student enters an invalid SBGI code on the Web	N	<p>This source/background institution (SBGI) code will fill in the SRTPCOL_SBGI_CODE, and the code the student entered will fill into SRTPCOL_SBGI_CODE_INVALID. This code is also used if student leaves the SBGI code blank but enters a name of the institution or any of the self-reported data. This rule is for the Web only. The value entered on SAAERUL for this must be a valid college on STVSBGI.</p>

Group	Label	Description	EDI	Instructions
PREL	UPDATEIFAPP	Update recruit record if application exists	N	<p>If set to <i>Y</i>, then the settings of the previous rules will be followed, even if a recruit record already exists for this person for the same term, level, and campus. If set to <i>N</i>, and a matching recruit record already exists, then based on your SAAERUL settings, the process will:</p> <ul style="list-style-type: none"> <li>• Insert new test score records on the Test Score Information Form (SOATEST).</li> <li>• Insert new high school records on the High School Information Form (SOAHSCH).</li> <li>• Insert new college records on the Prior College Form (SOAPCOL).</li> <li>• Insert the contact code into the SORCONT table.</li> <li>• Insert the source code into the SRRRSRC table if a matching recruit record exists or insert the source code into the SARRSRC table if a matching application record exists.</li> <li>• Update null values on the General Person Form (SPAPERS).</li> </ul>
PREL	VTYPADMR	Default ADMR Code for the Visa	Y	<p>Identifies the Checklist Summary Request Code for the Visa Code value to be inserted on the Admissions Application Detail block of the Admissions Application Form (SAAADMS) when loading a record from the Banner Student Self-Service Prospects (Recruiting) or Admissions modules. This rule is <i>only</i> used by the Web interface.</p>
PREL	WEBGENID	For Web only, use generated ID, or use entered SSN for ID	N	<p>Enter <i>G</i> to always use the generated ID which uses SOBSEQN functions. Enter <i>S</i> to use the SSN entered on the Web. If neither is entered, use a generated ID.</p>

 **Note**

The College Board Student Search Service provides AP exam codes indicating which exams the student took. However, no scores are provided with these exams. A school indicates to the College Board Student Search Service that they want any records for students with one or more AP exams between some range of scores (2 –5, 3 – 5, etc.). Given that the Test Score Information Form (SOATEST) requires a test score, AP exam codes will *not* be loaded into Banner. They will be accessible via the Search Tape View (SRVPREL). ■

 **Note**

You still use the Tape Code Conversion Form (SOTCNVT) to convert values from the various search tapes to Banner values. ■

## Electronic Prospect Purge (SRTPURG)

This process is used to delete records from the search or test score tape temporary tables based on the report parameter values. This process allows you to designate which records to purge. All data associated with a search or test score tape record is deleted.

 **Note**

Run the process in audit mode to determine which records will be removed from the temporary tables. ■

## Tape Code Conversion Form (SOTCNVT)

This form is used to convert codes on interface tapes to valid Banner values before data is added to the system during the tape load process. For example, if the SAT tape has a major code of *ENGL* for English and your institution's code for English is *100*, the table name would be *MAJR*, the tape value would be *ENGL* and the converted value would be *100*.

If there is a field on the tape which is left blank, but which is required in Banner, then an asterisk (\*) needs to be entered in the **Tape Value** field with the appropriate conversion value which will be assigned in Banner. For example, if the Major Code is blank on the tape, then a Major Tape Value of \* with a Converted Code of *0000* should be maintained.

If an entry exists on the tape but does not exist in SOTCNVT, a default entry needs to be added that has *DEFAULT* in the Tape Value column with the appropriate converted value to be assigned in Banner. For example, if a major of Forestry comes from the tape, and forestry is not a valid major at your institution, then a *DEFAULT* value of *0000* Undeclared Major or some other code of Unavailable Major should be maintained.

For example, the following two entries exist on SOTCNVT:

Table Name	Tape Value	Converted Code
MAJR	*	000A
MAJR	DEFAULT	0000

The student has not specified a major field of study, hence no value exists on the tape. Therefore, the tape value of \* would be used, and the major code would be created with 000A - Unknown Major. If the student has specified a major of Geology, which does not exist at the institution, and therefore does not exist on the SOTCNVT form, the DEFAULT value of 0000 - Undeclared Major will be used.

Use the **Copy Values** button to copy values from one interface code to another. When you select the button, the List of Values will display a row for each interface code which contains conversion values for the validation table entered in the Key Block. If no validation table name is entered, then the List of Values will display all interface codes that contain conversion records.

For example, if you have an **Interface Code** of *PCU*, and that code has conversions for **Validation Table Name** *INTS* (interests) defined on SOTCNVT, and you want to copy that data to an **Interface Code** of *SAT*, do the following.

1. Enter *SAT* in the **Interface Code** field and *INTS* in the **Validation Table Name** field.
2. Select the **Copy Values** button.
3. Select *PCU* from the Interface Codes for the Table window that appears and select **OK**. The rows from *PCU* with the table name equal to *INTS* are copied back to SOTCNVT for the **Interface Code** of *SAT* and the **Validation Table Name** of *INTS*.

If you want all conversion values from one interface code (i.e, *PCU*) copied to another interface code (i.e, *SAT*), do the following:

1. Enter *SAT* in the **Interface Code** field, and leave the **Validation Table Name** field blank.
2. Select the **Copy Values** button.
3. The Interface Codes with Conversion Rules window will appear, displaying all the interface codes that contain any conversion records.

The form allows *NATN* to be validated against the Nation Code Validation Form (STVNATN) for those tapes which have the Foreign Nation indicator field included. This allows for incoming nation data to be converted to the values existing in Banner. This validation is associated with an Interface Type to allow for different settings based on the incoming values provided with each tape type (*SAT*, *ACT*, *GRE*, and *GMAT*).

SOTCNVT validates the following fields:

SOTCNVT Table	Banner Validation Form	SRTLLOAD Field
NATN	STVNATN	SRTADDR_NATN_CODE
CITZ	STVCITZ	SRTPERS_CITZ_CODE
STAT	STVSTAT	SRTADDR_STAT_CODE
INTS	STVINTS	SRTINTS_INTS_CODE
INTP	STVINTS	SRTINTS_INTS_CODE
ETHN	STVETHN	SRTPERS_ETHN_CODE
ETHR	STVETHN	SRTPERS_ETHN_CODE
RACE	GORRACE	GORPRAC_RACE_CDE
DEGC	STVDEGC	SRTPREL_DEGC_CODE
DEGA	STVDEGC	SRTSUPL_APPL_TYPE
MAJR	STVMAJR	SRTPREL_MAJR_CODE
MAJP	STVMAJR	SRTPREL_MAJR_CODE
RELG	STVRELG	SRTPERS_RELG_CODE
CNTY	STVCNTY	SRTADDR_CNTY_CODE
TADM	STVTADM	SRTTEST_TADM_CODE
TERM	STVTERM	SRTPREL_TERM_CODE
DEPT	STVDEPT	SRTPREL_DEPT_CODE
VTYP	STVVYP	SRTINTL_VTYP_CODE_CURR_ENT
EDLV	STVEDLV	SRTPREL_EDLV_CODE
EGOL	STVEGOL	SRTPREL_GRAD_LEVEL
GNDR	N/A	SRTPERS_SEX
SBGI	STVSBGI	SRTPCOL_SBGI_CODE *

\* Prior college codes are tied to the SRATPFD variable PCOL\_SBGI\_CODE.

SOTCNVT Table	Banner Validation Form	SRTLOAD Field
SBGH	STVSBGI	SRTHSCH_SBGI_CODE
ADMT	STVADMT	SRTPREL_ADMT_CODE
CAMP	STVCAMP	SRTPREL_CAMP_CODE
ESEL	STVESEL	SRTSUPL_ESEL_CODE
TEAC	STVTEAC	SRTTEST_TEAC_CODE
TESC	STVTESC	SRTTEST_TESC_CODE
TEFR	STVTESC	SRTTEST_TEFR_CODE
TSPT	STVTSPT	SRTTSPC_PERCENTILE
HGPA	N/A	SRTHSCH_GPA

 **Note**

The table value of *GNDR* should be used on SOTCNVT to convert various gender formats on incoming tapes to the appropriate Banner values. *GNDR* works on SOTCNVT, even though it does not have a corresponding validation table. ■

SRTLOAD will first try to convert the above fields using the INFC code defined for the prospect code on STVPREL. If the field on the tape is null, then it will try the value \*. The \* in the tape value on SOTCNVT signifies that this value is used in Banner if the value from the tape file is null. In addition, if the tape value does not exist on the SOTCNVT crosswalk and is not valid in the Banner validation table, a message will print on the SRTLOAD report with the error. In the case where the value is not a valid Banner value, a match on SOTCNVT is attempted with the tape value of DEFAULT. This is where the default value is stored for the table.

The values used to convert the Term are the High School Graduation date or the Prior College Graduation date. The valid formats to enter on SOTCNVT in the tape value are YY, YYYY, 01-MON-YY, 01-MON-YYYY, 01MMYY, and 01MMYYYY. The YY and YYYY are the graduation year, and the MON and MM are the graduation month. If the graduation month is not on the tape or a match is not found, the month of June is used in the comparison.

The major and degree are required values on SRTPREL. If a default is not available on SOTCNVT, the values *0000* and *000000* are used.

## Race/Ethnicity Conversion

SOTCNVT uses the conversion value of *ETHR* to convert the incoming AMCAS RACE CODE 1 to the SRTPERS\_ETHN\_CODE value when the incoming AMCAS Hispanic Indicator is set to *N*.

The conversion value of *RACE* uses the GORRACE table. The incoming race value is converted based on the existing rules applied on GORRACE to load the incoming race value and associated institutional race code (GORRACE\_RACE\_CDE) to the SRTPRAC\_RACE\_CDE field. The conversion code of “\*” can be used for NULL data. The conversion code of DEFAULT can be used when data does not convert.

### Note

AMCAS has ten potential race codes that may be NULL, but the rule for “\*” will only be loaded to SRTSUPL and SRTPRAC one time. ■

AMCAS files will convert the race values from GORRACE, and the data will be loaded to SRTSUPL and to SRTPRAC. Non-AMCAS files will convert the race values from GORRACE, and the data will be loaded only to SRTPRAC. (Currently, no baseline electronic prospect files provide race information besides AMCAS.) Web prospects and Web applicants can submit race information using Banner Student Self-Service.

When validation is not set up on SOTCNVT for GORRACE (and when no DEFAULT or \* conversion values can be applied), validation may occur directly on GORRACE (if the incoming AMCAS value happens to match a GORRACE value), and then the race codes will be loaded to SRTPRAC.

A script is delivered to add the table values of *RACE* based on previous rules that had been established for the *ETHR* rule prior to Release 7.3. A valid institution race code must exist on STVETHN in order for the conversion of the race codes to apply and for SOTCNVT/*RACE* validation to be updated appropriately.

## Using PCU Tape Load

PCU (Private College Guide Search) tape load can be used with electronic prospects processing. Student type (freshman, transfer, other) and prior college information is processed for transfer records, as well as intended enrollment dates, current college name, and high school and prior college GPAs. SRRSRIN, SRRPREL, and SRTPURG can be run by student types. SRTLOAD can be used to collect data for prior college degree tracking.

## Loading Records to Banner

Records are loaded to Banner as follows during PCU processing.

- The student type is loaded from the SRTPREL\_STYP temporary table field to the SRBRECR\_STYP\_CODE Banner field.

- The high school GPA is loaded from the `SRTHSCH_GPA` temporary table field to the `SORHSCH_GPA` Banner field.
- The college code from the `UNKNOWNCPOL` rule on `SAAERUL` is loaded from the `SRTPCOL_SBG_CODE` temporary table field to the `SOAPCOL_SBG_CODE` Banner field. If no rule exists on `SAAERUL` for `UNKNOWNCPOL`, no other college data will be loaded.
- The PCU prior college degree from `SRTLOAD` is loaded from the `SRTDEGR_DEGC_CODE` temporary table field to the `SORDEGR_DEGC_CODE` Banner field, if a GPA exists.
- The prior college GPA is loaded from the `SRTPCOL_GPA_TRANSFERRED` temporary table field to the `SORDEGR_GPA_TRANSFERRED` Banner field.

## Forms Used with PCU Tape Load Processing

### *Tape Field Names Validation Form (STVTPFD)*

Use the values have on this form for student type, enrollment date, high school GPA, prior college GPA, and prior college name.

### *Tape Field Position Rule (SRATPFD)*

Use the values on this form for student type, enrollment date, high school GPA, prior college GPA, and prior college name where the **Tape Code** value is *PCU*.

### *Electronic Prospect Detail Form (SRAPREL)*

Use the **Student Type** field in the Electronic Prospect block in the main window. While most incoming non-PCU prospect records will not have a student type or will have a student type that defaults from `SRAPRED`, this field is important for PCU processing, so you can view/query PCU student types of *O* (Other) based on the rule set up on `SOTCNVT`.

### *Electronic Prospect Inquiry Form (SRIPREL)*

Use the **Student Type** field for PCU processing. While most incoming non-PCU prospect records will not have a student type or will have a student type that defaults from `SRAPRED`, this field is important for PCU processing, so you can view/query PCU student types of *O* (Other) based on the rule set up on `SOTCNVT`.

### *Tape Code Conversion Form (SOTCNVT)*

Use the crosswalk capability on `SOTCNVT` for student types (`STVSTYP`). `SOTCNVT` also accommodates the intended enrollment date.

- The term converts the two character year (YY positions 58-59) for the year of high school graduation to the recruiting term code.

- The same conversion rule for term will also be used to convert the four character intended enrollment date (MMYY positions 197-200) to the recruiting term code when the intended enrollment date exists and there is a valid conversion value.

 **Note**

For term records on SOTCNVT, YY conversions for the high school graduation year and MMYE conversions for the intended enrollment date will exist for the same conversion rule. ■

## PCU Term Code SOTCNVT Conversions

The high school graduation date and the intended enrollment date share the SOTCNVT rule where the **Interface Type** is *PCU* and the **Validation Table Name** is *TERM*. When an intended enrollment date exists, that value will be checked first for conversion. If the conversion takes place as a result of the *DEFAULT* rule on SOTCNVT, the system will check to see if a high school graduation date exists. If the high school graduation date exists, the conversion will be attempted. If no conversion takes place, the *DEFAULT* rule will be used, if it exists. If no rule exists for either value (high school graduation date or intended enrollment date) the \* (NULL) rule will be used, if it exists.

 **Note**

Functionality currently exists for the conversion of the high school GPA and the prior college GPA. You will need to set up rules to convert the incoming PCU high school GPA (*HGPA*) and the prior college GPA (*CGPA*). ■

## Processing and Validation of Student Type

The incoming student type values from the PCU tape load are:

- *T* (Transfer)
- *F* (Freshman)
- *O* (Other, Unknown)

For the PCU 2007 Regulatory File, it is recommended that the incoming student types are converted appropriately so they can be loaded to Banner. Conversion values should be set up for *T*, *F*, and *O*, as well as the optional values for the \* (NULL) and *DEFAULT* rules on SOTCNVT. The PCU suggests that users do not process incoming records with student types of *O* (in positions 60 - 61) for loading into the Banner production tables without first performing a manual review of the data.

These records, for example, may have been filled out by a parent, and the information may contain parent data as opposed to student data, and therefore should not be loaded into Banner. Unless the actual data file is carefully reviewed, there is no way to know what the student types are until after they have been loaded into the temporary tables when SRTLOAD is run, and the data is viewed on SRIPREL/SRAPREL.

## Setup Steps on SOTCNVT

SunGard Higher Education recommends the following data be set up on SOTCNVT for the PCU student type, in order to track and process (or not process) PCU student type records with a value of *O*.

1. Set up a unique conversion value for the student type of *O* (Other).

Having a single, unique conversion value for the student type allows you to track, review, and process these records efficiently. The conversion value for *O* (Other) should not be used for any other PCU student type conversions on SOTCNVT. The PCU suggests manually reviewing records with a student type of *O*, before they are loaded into Banner.

2. Set up appropriate conversion values for the student types of *F* and *T*.

These values should be different than the value used to convert the student type of *O*.

3. Set up a \*(NULL) rule for any PCU student type values that are null.

This value should be different than the value used to convert the student type of *O*.

4. Set up a *DEFAULT* rule for any PCU student type that will not be translated correctly.

This value should be different than the value used to convert the student type of *O*.

### Note

If the **Student Type** field on SRAPRED has a default value for the electronic prospect code *PCU*, it is recommended that this default value *not be equal to* the SOTCNVT rule that has been set up for the unique conversion of the PCU student type value of *O*.

If NULL student types are delivered on the PCU file, and no rule exists on SOTCNVT for \*(NULL) student types, the student type value on SRAPRED will be defaulted. This default value from SRAPRED should not be confused with the student type conversion on SOTCNVT for incoming records with student types of *O*. Setting up your SOTCNVT and SRAPRED rules as suggested will allow you to tie a unique student type to the incoming PCU student type of *O*. ■

5. Once appropriate student types have been assigned via SRTLOAD based on the rules on SOTCNVT, you can run SRRSRIN, SRRPREL, and SRTPURG, and process records by specific student types.

## Reports Used with PCU Tape Load Processing

### *Electronic Prospect Load (SRTLOAD)*

#### *Prior College Degree Tracking*

SRTLOAD will update the prior college for the *UNKNOWNPCOL* rule on SAAERUL, when a current college name exists on the incoming file. If the *UNKNOWNPCOL* rule does not exist, no prior college will be loaded to the temporary table. No attempt will be made to convert the incoming PCU Current College Name field. (This field is a free format field from the PCU.) The field value may be selected from a pick list provided by the PCU or may be manually entered by recruit/prospect.

Due to the variety of data entry options (selecting a college name or manually entering the data), the absence of an incoming college code to be used for conversion to Banner, the PCU value length of 100 characters (in contrast to the 30 character description length on STVSBGI), as well as potential misspellings, abbreviations, and formatting and data inconsistencies related to manual entry, no attempt will be made to compare the incoming PCU Current College Name value against the description in STVSGBI to avoid corrupt, incorrect, or incomplete data.

Use the PCU Prior College Degree Code parameter for prior college degree tracking. You can enter the degree code that will be applied to the prior college record, for PCU processing. The parameter is validated against the Degree Code Validation Form (STVDEGC).

The PCU file provides a prior college GPA, but it does not provide a degree code. If the prior college GPA exists, it cannot be loaded without an associated degree and/or degree sequence number. The degree GPA also requires the existence of the *UNKNOWNPCOL* rule on SAAERUL. The PCU Prior College Degree Code parameter will provide a degree code that is loaded to the SRTDEGR/SORDEGR tables when a prior college GPA and an incoming current college name exist. When the degree from the parameter and the GPA are loaded, the degree will not be flagged as primary, since the PCU does not provide that information in the file. The degree will not be loaded without an existing GPA.

#### **Note**

No college and/or degree information will be loaded without an *UNKNOWNPCOL* rule in SAAERUL. If it is preferred no PCU college, degree, and/or GPA data be loaded to Banner, this rule may be removed from SAAERUL. ■

#### *Processing and Output*

SRTLOAD will perform the following during processing:

- It will load the student type value to the SRTPREL\_STYP field in Banner.

- It will load the incoming high school GPA to the `SRTHSCH_GPA` field in Banner. A high school code must exist for conversion or default, or the incoming high school GPA will not be loaded.
- It will load the incoming prior college GPA to the `SRTPCOL_GPA_TRANSFERRED` field in Banner. The prior college GPA will not be loaded unless the `UNKNOWNPCOL` rule has been set up on `SAAERUL`, and the PCU degree has been entered in the PCU Prior College Degree Code parameter in `SRTLOAD`.

Prior to the optional Summary Report in the `SRTLOAD` output, a list of ID numbers is printed from the incoming PCU file for records with the student type of *O*. (Please note that you may have chosen a different student type for these records on `SOTCNVT`.) This list of IDs can be used to review the records on `SRIPREL`. The records with a student type of *O*, as well as any other records, can then be loaded manually or processed using `SRRSRIN` and/or `SRRPREL`.

### ***Electronic Prospect Match (SSRSRIN)***

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (`STVSTYP`).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded from the match and/or load processes, they can be manually reviewed and matched and/or pushed on `SRIPREL` and/or purged using `S RTPURG`. This allows you to selectively process or not process PCU student types.

If `NULL` student types need to be processed, all applicable student types should be processed first, so that only the `NULL` types remain. Leave the Student Type parameter blank, and the `NULL` student types will be picked up, as they will be the last types that remain during processing.

#### **Note**

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be `NULL`, or they will use the default student type for the specific electronic prospect code that was updated on `SRAPRED`. ■

If the Auto Load (Skip Dup Chk) parameter is set to *N* (perform duplicate processing), and the Student Type parameter is updated, a match status will be assigned for the student types that have been entered. When the Student Type parameter is blank, a match status will be assigned to all student types.

If the Auto Load (Skip Dup Chk) parameter is set to *Y* (load new and matched IDs), and the Student Type parameter is updated, a match status will be assigned for the student types that have been entered, and the records will be loaded to Banner. When the Student Type parameter is blank, a match status will be assigned to all student types, and the records will be loaded to Banner.

### ***Migrate Electronic Prospects Process (SRRPREL)***

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (STVSTYP).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded (not entered in this parameter), they can be manually reviewed and pushed (or not) on SRIPREL and/or purged using S RTPURG. This allows you to selectively process or not process PCU student types.

If NULL student types need to be processed, all applicable student types should be processed first, so that only the NULL types remain. Leave the Student Type parameter blank, and the NULL student types will be picked up, as they will be the last types that remain during processing.

#### **Note**

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be *NULL*, or they will use the default student type for the specific electronic prospect code that was updated on SRAPRED. ■

### ***Electronic Prospect Purge (S RTPURG)***

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (STVSTYP).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded (not entered in this parameter), they can be manually reviewed and pushed (or not) on SRIPREL and/or purged using S RTPURG. This allows you to selectively process or not process PCU student types.

If NULL student types need to be processed, all applicable student types should be processed first, so that only the NULL types remain. Leave the Student Type parameter

blank, and the NULL student types will be picked up, as they will be the last types that remain during processing.

#### **Note**

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be *NULL*, or they will use the default student type for the specific electronic prospect code that was updated on SRAPRED. ■

## Using ACT Tape Load

SRTLLOAD can also be used to load ACT Electronic Student Record (Colleges and Universities) data to Banner.

When loading Canadian province data, make sure the ACT-defined values that are reported exist and have been updated appropriately in STVSTAT and/or SOTCNVT. The Canadian province data is loaded to the SRTADDR\_STAT\_CODE field and/or the SPRADDR\_STAT\_CODE field in Banner.

SRTLLOAD loads the Canadian province and Canadian postal code values to the corresponding temporary tables in Banner. (Values exist on STVTPFD and SRATPFD for *CANADIAN\_PROVINCE* and *CANADIAN\_POSTAL\_CODE*.) The process also accommodates the nation code for Canada (*CN*) when that code is listed as the state code value on the file.

When data exists for a Canadian province, the state code value will be the nation code on the ACT file. This field could also be blank, but the ACT indicates the value should be *CN* when values exist for the Canadian province and Canadian postal code on the file.

### Updating the Canadian Nation Code in STVNATN and/or SOTCNVT

For a nation code to be converted from the ACT file, the value of *CN*, with a description of *Canada*, should be added to STVNATN, or the appropriate conversions should be set up on SOTCNVT. When the state code on the file is *CN*, a check will occur for Canadian province code and Canadian postal code values. When no conversion takes place for the *CN* nation code in STVNATN or SOTCNVT, and the Canadian province code and Canadian postal code values exist, the nation, Canadian province, and Canadian postal code values will not be loaded to Banner.

### Reviewing the State Code List

The list of state codes used by the ACT includes Puerto Rico and the US Trust Territories. You need to review the state code list from the ACT and update STVSTAT appropriately. You also need to review and update SOTCNVT for an **Interface Type** of *ACT* and a **Validation Table Name** of *STAT*.

## Loading Multiple Records

Students may appear on an ACT file more than once if they have taken multiple tests in different locations (such as national, state, etc.). These multiple occurrences of the tests may have the same month and year dates. ACT does not provide a day to distinguish between test dates. To accurately differentiate between these records, ACT recommends that you *always* use the test location value, in addition to the test date (month and year) value.

In Banner, SOATEST does not allow the entry of multiple test scores for the same test on the same date. SOATEST requires a unique “day” in order to process the test score. In this case, the day is loaded as the first day of the month and year that is reported as the test date value on the file. When test scores are reported on the same test date (month and year) with different test locations, the test “day” is defaulted as the next available one-up day for the same month and year for the particular test code.

You need to review the ACT test location value and update STVTADM and/or SOTCNVT appropriately. This ensures that test scores for multiple tests taken in the same month and year will be loaded to Banner when the test location is changed. The test location updates the **Administration Type** value on SOATEST.

## Viewing Present Test Location on SRAPREL

The ACT test location can be viewed on SRAPREL in the Percentile block of the Test Scores and Percentiles window. As you scroll through the test records in the Test Score block, the test type, date taken, and test location/test score administration type code (STVTADM) values are displayed in the *test type taken on date with administrative type* field in the Percentile block.

## 2010 ACT File Format

The 2010 file format uses new codes, conversion values, and fields. Field positions have been changed. Test codes have been removed. Data has been updated for race/ethnicity, majors, and religious affiliation. A phone number data type is now used.

### Note

Please review the ACT EXPLANATION OF 2010 IMPLEMENTATION OF CHANGES in REPORTING of RACE/ETHNICITY INFORMATION on ACT STUDENT RECORDS to assist in converting race and ethnicity codes for your institution. SunGard does not provide conversions of existing data related to ACT student records. You can evaluate all new and changed ACT codes and make appropriate updates on SOTCNVT. ■

Details regarding the changes to the ACT Electronic Student Record for 2010-2011 can be found at the following link: <http://www.act.org/aap/infosys/changes.html>.

### ***File Updates***

The following items have been updated in the ACT file.

<b>Updated Items</b>	<b>Positions</b>	<b>New/Changed ACT Values</b>	<b>SRATPFD Tape Code</b>	<b>SOTCNVT Validation</b>
Race/Ethnicity	471	SOTCNVT	ETHN_CODE	ETHN
Major	411-413	SOTCNVT	MAJR_CODE	MAJR
Religious Affiliation	606-607	SOTCNVT	RELG_CODE	RELG

The following items have been added to the ACT file.

<b>New Items</b>	<b>Positions</b>	<b>New/Changed ACT Values</b>	<b>SRATPFD Tape Code</b>	<b>SOTCNVT Validation</b>
Type of Telephone	100	SOTCNVT	TELE_TYPE_CODE	TELE
Race/Ethnicity	608	SOTCNVT	HISP_IND 1 = Y 2 = N	N/A
Race/Ethnicity	609-613	SOTCNVT	RACE1 - RACE5	RACE

The following additional changes have been made that are not related to the regulatory updates.

<b>Changes</b>	<b>Positions</b>	<b>New/Changed ACT Values</b>	<b>SRATPFD Tape Code</b>	<b>SOTCNVT Validation</b>
Percentiles added	See “Percentiles associated with test scores” topic	N/A	See “Percentiles associated with test scores” topic	N/A
Street Address Line 1 extended	45-84	N/A	STREET_LINE1	N/A

### ***Conversion of Codes***

The following conversion values should be reviewed and changes made to SOTCNVT as needed.

- The ETHN\_CODE value is now reported in position 471. You should review the conversion values and update SOTCNVT as necessary for **Interface Type** of *ACT* and **Validation Table Name** of *ETHN*.
- The MAJR\_CODE value is now reported in position 411-413. You should review the conversion values and update SOTCNVT as necessary for **Interface Type** of *ACT* and **Validation Table Name** of *MAJR*.
- The RELG\_CODE value is now reported in position 606-607. You should review the conversion values and update SOTCNVT as necessary for **Interface Type** of *ACT* and **Validation Table Name** of *RELG*.
- The TELE\_TYPE\_CODE value is reported in position 100. You should review the conversion values and update SOTCNVT as necessary for **Interface Type** of *ACT* and **Validation Table Name** of *TELE*.
- The TELE\_TYPE\_CODE value will be loaded with the telephone number using the following hierarchy:
  - SOTCNVT - Valid tape value conversion rule or *DEFAULT* tape value rule (if one exists)
  - SRTLLOAD - Value in the Telephone Type Code parameter
  - STVATYP - **Telephone Type** value (if it exists) associated with the SRTLLOAD Address Type Code parameter value.
  - Telephone type that matches the STVATYP **Address Type** value.

This is used when the STVATYP **Telephone Type** value is *Null*, and a valid STVTELE telephone type **Code** value exists (such as *MA*) that matches the STVATYP **Address Type** value (such as *MA*).

- The HISP\_IND value is reported in position 608. The value in the HISP\_IND field will be loaded to the temporary SRTPERS\_ETHN\_CATEGORY field and the permanent SPBPERS\_ETHN\_CDE field in Banner.

#### **Note**

There is no conversion available on SOTCNVT for the HISP\_IND field. ■

The ACT Hispanic or Latino Background values are:

- 1 - Yes
- 2 - No
- 3 - Prefer not to respond

When these values are loaded into Banner, the following occurs:

- When the incoming value is 1, the SRTPERS\_ETHN\_CATEGORY field or the SPBPERS\_ETHN\_CDE field is set to *HISP*.
- When the incoming value is 2, the SRTPERS\_ETHN\_CATEGORY field or the SPBPERS\_ETHN\_CDE field is set to *NON-HISP*.

- When the incoming value is another value or is *Null*, the SRTPERS\_ETHN\_CATEGORY field or the SPBPERS\_ETHN\_CDE field is set to *NULL* or *NONE*.

Once the HISP\_IND values have been loaded to the Banner production tables, they are displayed in the **New Ethnicity** field on SPAPERS. The field values are *Hispanic or Latino, Not Hispanic or Latino, or None*. The setting of the **Ethnicity and Race Confirmed** indicator and **Confirmed Date** value will be updated as appropriate.

- The RACE1 - RACE5 values are reported in positions 609-613. You should review the conversion values and update SOTCNVT as necessary for **Interface Type** of *ACT* and **Validation Table Name** of *RACE*. Refer to the following website: <http://www.act.org/aap/infosys/changes.html>

ACT race values in positions 614-615 are not currently loaded to Banner. If you choose to load these race values from the ACT file, you need to modify SRATPFD to include values for RACE6 and RACE7. Be sure to account for these codes on SOTCNVT for **Interface Type** of *ACT* and **Validation Table Name** of *RACE*.

The following table shows the ACT Race fields that are not loaded to Banner and how they can be added at your institution.

<b>ACT Race Fields not Loaded to Banner</b>	<b>Position on Incoming File</b>	<b>User Accommodation</b>
Prefer Not to Respond	Position 614  No data load to Banner implies not reported or no response.	Add RACE6 to SRATPFD and create conversion value for “No Response” if your institution requires this information.
Multiracial	Position 615  ACT may report a single value for Multiracial in position 615 for converted records only.	Add RACE7 to SRATPFD and create conversion value for “Multiracial” if your institution requires this information.

### ***Percentiles Associated with Test Scores***

ACT National Norm Percentiles associated with test scores are used in the file. Previously, some percentiles had been loaded as test scores in SOATEST. Those test score field name values have been removed from SRATPFD for the **Tape Code** of *ACT*. New ACT national norm percentiles are loaded as the true percentiles associated with the test scores. Also, some test scores had no percentiles loaded as test scores or other data. Those test scores now include the associated ACT national norm percentiles.

#### **Note**

The test score field names that are no longer used have not been removed from STVTPFD. However, now percentiles are loaded instead of

test scores, based on the ACT fields that have been added to SRATPFD.

SunGard does not provide any conversion scripts to convert the old test scores (that represented percentiles on SOATEST) to the new percentiles. ■

The following table shows the current ACT test score field names used on SRATPFD, the obsolete test score field names that are no longer loaded to Banner, and the new ACT National Norm Percentile field names on SRATPFD that are used instead.

<b>ACT Test Score Field Name</b>	<b>Obsolete Test Score Field Name</b>	<b>ACT Percentile Field Name</b>
A07_TEST_SCORE	NEW_TEST_SCORE	A07_NATIONAL_NORM
SWR_TEST_SCORE	NWR_TEST_SCORE	NWR_NATIONAL_NORM
SUM_TEST_SCORE	NUM_TEST_SCORE	NUM_NATIONAL_NORM
SRH_TEST_SCORE	NRH_TEST_SCORE	NRH_NATIONAL_NORM
SEA_TEST_SCORE	NEA_TEST_SCORE	NEA_NATIONAL_NORM
SAG_TEST_SCORE	NAG_TEST_SCORE	NAG_NATIONAL_NORM
SGT_TEST_SCORE	NGT_TEST_SCORE	NGT_NATIONAL_NORM
SSS_TEST_SCORE	NSS_TEST_SCORE	NSS_NATIONAL_NORM
SAL_TEST_SCORE	NAL_TEST_SCORE	NAL_NATIONAL_NORM

The following table compares the overall values and the file positions. It shows the:

- current ACT test score field names on SRATPFD
- new ACT percentile field names on SRATPFD
- obsolete test score field names no longer loaded to Banner and replaced by the new percentile field names
- percentile type

<b>Current Test Scores</b>	<b>From</b>	<b>To</b>	<b>New Percentiles</b>	<b>From</b>	<b>To</b>	<b>Obsolete Test Scores</b>	<b>Percentile Type</b>
			<i>Not previously loaded</i>			<i>No previous percentile representation</i>	
A01_TEST_SCORE	261	262	A01_NATIONAL_NORM	773	774	No score previously loaded	ANN
A02_TEST_SCORE	263	264	A02_NATIONAL_NORM	775	776	No score previously loaded	ANN
A03_TEST_SCORE	265	266	A03_NATIONAL_NORM	777	778	No score previously loaded	ANN
A04_TEST_SCORE	267	268	A04_NATIONAL_NORM	779	780	No score previously loaded	ANN
A05_TEST_SCORE	269	270	A05_NATIONAL_NORM	781	782	No score previously loaded	ANN
A06_TEST_SCORE	272	274	N/A	N/A	N/A	N/A	N/A

Current Test Scores	From	To	New Percentiles	From	To	Obsolete Test Scores	Percentile Type
			<i>New National Norm Percentiles</i>			<i>Test score fields no longer loaded - replaced by New National Norm Percentiles</i>	
A07_TEST_SCORE	163	164	A07_NATIONAL_NORM	167	168	NEW_TEST_SCORE	ANN
SWR_TEST_SCORE	165	166	NWR_NATIONAL_NORM	169	170	NWR_TEST_SCORE	ANN
SUM_TEST_SCORE	320	321	NUM_NATIONAL_NORM	334	335	NUM_TEST_SCORE	ANN
SRH_TEST_SCORE	322	323	NRH_NATIONAL_NORM	336	337	NRH_TEST_SCORE	ANN
SEA_TEST_SCORE	324	325	NEA_NATIONAL_NORM	338	339	NEA_TEST_SCORE	ANN
SAG_TEST_SCORE	326	327	NAG_NATIONAL_NORM	340	341	NAG_TEST_SCORE	ANN
SGT_TEST_SCORE	328	329	NGT_NATIONAL_NORM	342	343	NGT_TEST_SCORE	ANN
SSS_TEST_SCORE	330	331	NSS_NATIONAL_NORM	344	345	NSS_TEST_SCORE	ANN
SAL_TEST_SCORE	332	333	NAL_NATIONAL_NORM	346	347	NAL_TEST_SCORE	ANN

SRTLOAD loads these percentiles and the corresponding ACT National Norm Percentile fields for the STVTPST code of ANN.

ACT SRATPFD National Norm Percentile Codes	Corresponding ACT SRATPFD Test Score Fields	Associated STVTPST Code
A01_NATIONAL_NORM	A01_TEST_SCORE	ANN
A02_NATIONAL_NORM	A02_TEST_SCORE	ANN
A03_NATIONAL_NORM	A03_TEST_SCORE	ANN
A04_NATIONAL_NORM	A04_TEST_SCORE	ANN
A05_NATIONAL_NORM	A05_TEST_SCORE	ANN
A07_NATIONAL_NORM	A07_TEST_SCORE	ANN

NAG_NATIONAL_NORM	SAG_TEST_SCORE	ANN
NGT_NATIONAL_NORM	SGT_TEST_SCORE	ANN
NSS_NATIONAL_NORM	SSS_TEST_SCORE	ANN
NAL_NATIONAL_NORM	SAL_TEST_SCORE	ANN

Field name values have been added to the Tape Field Names Validation Form (STVTPFD) for use with the ACT file.

Field Name	Description	System Required
TELE_TYPE_CODE	Telephone Type Code	Yes
A01_NATIONAL_NORM	ACT English National Norm	Yes
A02_NATIONAL_NORM	ACT Math National Norm	Yes
A03_NATIONAL_NORM	ACT Reading National Norm	Yes
A04_NATIONAL_NORM	ACT Science National Norm	Yes
A05_NATIONAL_NORM	ACT Composite National Norm	Yes
A07_NATIONAL_NORM	ACT Combined English/Writing National Norm	Yes
NWR_NATIONAL_NORM	ACT Writing National Norm	Yes
NUM_NATIONAL_NORM	ACT Usage/Mech National Norm	Yes
NRH_NATIONAL_NORM	ACT Rhetorical Skills National Norm	Yes
NEA_NATIONAL_NORM	ACT Elem Algebra National Norm	Yes
NAG_NATIONAL_NORM	ACT Alg/Coord Geom National Norm	Yes
NGT_NATIONAL_NORM	ACT Plane Geom/Trig National Norm	Yes
NSS_NATIONAL_NORM	ACT Soc Stud/Sci National Norm	Yes
NAL_NATIONAL_NORM	ACT Arts/Lit National Norm	Yes

Field names have been updated on the Tape Field Position Rule Form (SRATPFD) for the **Tape Code** value *ACT*. The start and end positions have been changed.

Field Name	Old Start	Old End	New Start	New End
RELG_CODE	468	468	606	607
STREET_LINE1	45	74	45	84

The following field name value has been removed for the **Tape Code** value *ACT*.

Field Name	Start Position	End Position	Occurrence
STREET_LINE2	75	84	1

 **Note**

The STREET\_LINE1 field name has been expanded to use positions 45-84 and can accommodate the entire street address on one line. STREET\_LINE2 is no longer used. ■

Percentile field names have been added that replace existing test score field names. The values are loaded as percentiles.

Old Field Name	New Field Name	Start Position	End Position
NEW_TEST_SCORE	A07_NATIONAL_NORM	167	168
NWR_TEST_SCORE	NWR_NATIONAL_NORM	169	170

Old Field Name	New Field Name	Start Position	End Position
NUM_TEST_SCORE	NUM_NATIONAL_NORM	334	335
NRH_TEST_SCORE	NRH_NATIONAL_NORM	336	337
NEA_TEST_SCORE	NEA_NATIONAL_NORM	338	339
NAG_TEST_SCORE	NAG_NATIONAL_NORM	340	341
NGT_TEST_SCORE	NGT_NATIONAL_NORM	342	343
NSS_TEST_SCORE	NSS_NATIONAL_NORM	344	345
NAL_TEST_SCORE	NAL_NATIONAL_NORM	346	347

Field name values have been added for the **Tape Code** value *ACT*.

Field Name	Start Position	End Position	Occurrence
HISP_IND	608	608	1
TELE_TYPE_CODE	100	100	1
RACE1	609	609	1
RACE2	610	610	1
RACE3	611	611	1
RACE4	612	612	1
RACE5	613	613	1
A01_NATIONAL_NORM	773	774	1
A02_NATIONAL_NORM	775	776	1
A03_NATIONAL_NORM	777	778	1
A04_NATIONAL_NORM	779	780	1
A05_NATIONAL_NORM	781	782	1

The *ANN* test score percentile code has been added to the Test Score Percentile Type Validation Form (STVTSPT for use with the ACT file).

Code	Description	System Required
ANN	ACT National Norm Cumulative Percent	Yes

## 2010 ACT EOS File Format

Electronic file characteristics for the ACT EOS Electronic Student Record 2010-2011 do not include positional changes. However, the ACT is delivering the Race/Ethnicity value in position 150 and the Intended College Major value in positions 181-183 with new and/or different code values.

You will need to follow up with the ACT EOS for more information on code changes, new codes, file layout, and delivery dates for the 2010-2011 reporting year. You can then modify the rules on SOTCNVT appropriately for your ACT EOS interface type code for the **Validation Table Name** of *ETHN* and the **Validation Table Name** of *MAJR*. Changes

to your SOTCNVT rules will need to be coordinated with delivery and processing of the first ACT EOS file of the 2010-2011 reporting year.

Details regarding the changes to the ACT EOS 2010-2011 for 2010-2011 can be found at the following link: [ACT-EOS@act.org](mailto:ACT-EOS@act.org) or through [www.act.org/eos](http://www.act.org/eos).

 **Note**

Refer to FAQ #1-DJSK96 (ACT EOS Electronic Student Record 2010-2011) on the Customer Support Center for more information. ■

## Using Peterson Tape Load

SRTLOAD can be used to load Peterson data, including home and mobile phone numbers. When SRTLOAD is run for Peterson tape load, the value in the Telephone Type Code parameter should reflect the telephone type that is appropriate for a home phone. However, SRTLOAD does allow for the use of multiple telephone type codes. SRATPFDF also allows for multiple occurrences of phone area code and phone number data.

### Using SRTLOAD With Peterson Tape Load

SRTLOAD accepts the entry of multiple telephone type codes and accommodates up to nine telephone numbers on an incoming file. Multiple values can be entered in the Telephone Type Code parameter.

- When SRTLOAD processes multiple phone codes, the telephone type code in the Telephone Type Code parameter is specifically associated with the occurrence of the telephone number on the incoming file.
- When a value is entered in the Telephone Type Code parameter, the value must be preceded by the corresponding occurrence of the telephone number for the associated tape code in SRATPFDF.

SRTLOAD will not run to completion if the number of telephone type codes entered do not match the occurrences of the phone number in SRATPFDF. In this situation, the following error will be displayed in the log file:

```
Parameter 16 Invalid Telephone Sequence Number  
srtload terminated with error  
0 lines written to /export/home/lparrish/jobsub/srtload_200590.lis
```

To load telephone numbers successfully, the Telephone Type Code parameter must *always* be preceded by the occurrence number, *even* when a single telephone number exists on the incoming file. In this case, 1 would be used. The number of occurrences of the telephone type code *must* match the number of occurrences of the telephone numbers in SRATPFDF for the file being processed.

## First and Second Occurrence of Phone Number

The primary phone number or the phone number associated with an address is considered to be the first occurrence of the phone number when that phone number exists and is loaded into Banner. For the Peterson file, that is the home phone value.

- Occurrence one is associated with the home phone value.

The telephone code preceded by a value of 1 for the Telephone Type Code parameter will *always only* correspond to the home phone (such as *IMA*).

- Occurrence two is associated with the mobile phone value.

The telephone code preceded by a value of 2 for the Telephone Type Code parameter will *always only* correspond to the mobile phone (such as *2MO*).

### Note

The second phone number will not be visible on SRAPREL/SRIPREL or GOAMTCH. It will not be used in common matching. It will not be printed on the SRTLOAD output. However, the Control Page for the report will show the second occurrence for the Telephone Type Code parameter, if it is entered on GJAPTCL. ■

The order in which the codes are entered in the Telephone Type Code parameter is associated with the occurrence of the telephone number in SRATPFDF. The occurrences of telephone type codes in the Telephone Type Code parameter *must* match the number of occurrences of the *PHONE\_AREA* and *PHONE\_NUMBER* **Field Name** values listed in SRATPFDF.

- When the Telephone Type Code parameter is set to *IPR*, it will be associated with the first occurrence of the home phone value that reflects occurrence one of *PHONE\_AREA* and *PHONE\_NUMBER* in SRATPFDF.
- When the Telephone Type Code parameter is set to *2MO*, it will be associated with the second occurrence of the mobile phone value that reflects occurrence two of *PHONE\_AREA* and *PHONE\_NUMBER* in SRATPFDF.

### Note

If users prefer that one or both of the Peterson phone numbers not be loaded to Banner for any reason, the associated fields and occurrences can be removed from SRATPFDF. ■

## Saved Parameter Sets

All incoming files processed by SRTLOAD that include a telephone number will require the value for the Telephone Type Code parameter to be preceded by an occurrence of the telephone number on SRATPFDF. (Currently, only Peterson provides more than a single telephone code.) For all other files (except for Peterson) this will be 1. For example, when a user attempts to enter only the code, such as *MA*, the following error message will be displayed if the Telephone Type Code parameter value is not preceded by the occurrence: *ERROR: Parameter value failed STVTELE\_EQUAL\_2345 validation.*

If saved rule settings exist for SRTLOAD and the Telephone Type Code parameter, the delivered `suppdf1.sql` script can be used to modify the existing telephone type code to be preceded by 1. (As SRTLOAD previously only accommodated a single entry for the telephone type code, that value will always be 1.) Saved rule settings can be found in the GJRJPRM and GJBPRUN tables.

### Job Submission Navigation Tips for Multiple Telephone Type Codes

When processing files with multiple occurrences for telephone numbers in SRATPFDD, do the following for SRTLOAD in job submission (GJAPCTL), to enter parameter values for the multiple occurrences.

1. Navigate to the Telephone Type Code parameter (number 16) in the Parameter Values block.
2. Enter the code for home phone, *IMA*.
3. Perform an Insert Record function and then a Duplicate Record function.

This creates a second row for Parameter 16. The added parameter will still display the *IMA* value.

4. Change the parameter value to the code for mobile phone, *2MO*.
5. Save your changes.

### 2010 Peterson File Format

Significant positional changes have been made to the 2010 file. The file uses eight additional interest codes (numbered 7 - 14) from SRATPFDD and STVTPFDD. The *NATION\_CODE* field name is also included in the file to Address: Country Code item.

You will need to update the Tape Code Conversion Form (SOTCNVT) appropriately. Please contact Peterson directly for details regarding the Peterson Fixed File Data Dictionary and/or Peterson Codes for translation on SOTCNVT.

### 2010 GRE File Format

The GRE record layout has been updated and a provision added for the future release of the GRE revised General Test. A copy of the 2010-2011 GRE Optional Score Reporting Record Layout is available at: [www.ets.org/gre/2010recordlayout](http://www.ets.org/gre/2010recordlayout).

The overall length of the GRE Optional Score Reporting Record Layout has been increased from 500 to 600 characters. The location of each field after position 70 has been modified. The Tape Field Position Rule Form (SRATPFDD) has been updated to accommodate these field position changes for field names with a **Tape Code** value of *GRE*. A script is delivered to update the rows on SRATPFDD.

## Additional Fields

The following fields have been added to the record layout. Associated updates have been made to SRATPFDF as needed.

- Intended Graduate Major Field Code

This field name will not be added to SRATPFDF at this time, since this value will be *Null* until Fall 2011. In Fall 2011, the *MAJR\_CODE* field name start and end positions (37-40) can be changed to use the positions for the Intended Graduate Major Field Code field (71-74). The *MAJR\_CODE2* field name can also be added for positions 37-40, once both majors are being reported.

- Intended Graduate Major Field Name

This field name is not used. Only the Major Field Code is used.

- Examinee's ISO Country Code

The *NATION\_CODE* field name (positions 329-331) has been added to SRATPFDF. The *NATION\_NAME* field name is no longer used and has been removed from SRATPFDF.

### Note

You will need to build a crosswalk rule on the Tape Code Conversion Form (SOTCNVT) for the specific ISO Country Code listing used by the GRE. Refer to the ETS website for their ISO Country Code list.

[http://www.ets.org/Media/Tests/GRE/pdf/gre\\_0910\\_online\\_bulletin.pdf](http://www.ets.org/Media/Tests/GRE/pdf/gre_0910_online_bulletin.pdf)

- Examinee's Telephone Number

This is a free-format field that is 20 characters in length. Field names for *PHONE\_AREA* (positions 345-347) and *PHONE\_NUMBER* (positions 348-354) have been added to SRATPFDF.

- Examinee's E-mail Address

The *EMAIL\_ADDR* field name has been added to SRATPFDF in positions 365-409.

Field name values have been added to SRATPFDF for the **Tape Code** value *GRE*.

Field Name	Start Position	End Position	Occurrence
EMAIL_ADDR	365	409	1
NATION_CODE	329	331	1
PHONE_AREA	345	347	1
PHONE_NUMBER	348	354	1
PHONE_COMMENT	355	364	1
STREET_LINE3	226	257	1

Values have been added to STVTPFD for use with the GRE file.

Field Name	Description	System Required
PHONE_COMMENT	Phone Comment for GRE	Yes
STREET_LINE3	Street Address Line 3	Yes

### Modified Fields

The following fields have been modified on the record layout. Associated changes have been made to SRATPFD.

- Examinee's Street Address  

Previously the Examinee's Street Address field used two 45-character fields. Now it uses three 32-character fields. The field names on SRATPFD are *STREET\_LINE1* (positions 162-193), *STREET\_LINE2* (positions 194-225), *STREET\_LINE3* (positions 226-257).

*STREET\_LINE3* is loaded to SRTADDR and then pushed to SPRADDR by SRKPREL.
- The Social Security Number (SSN) field has been truncated to report only the last four digits. The last four digits of the SSN are not loaded to Banner for the following reasons:
  - This value is not unique to the individual.
  - This value is of limited use for common matching.
  - This value is not provided with international records.
  - This value is not equal to the SSN and is not loaded to the SPBPERS\_SSN column in the SPBPERS table. It would prevent the update of the actual SSN if it existed in the SPBPERS\_SSN column. SRKPREL does not update existing fields. The package only updates *Null* fields.
- The SSN field name is no longer used and has been removed from SRATPFD.

### Revised General Test Codes

Test codes for 03 Revised General Quantitative, Revised General Verbal, and Revised General Writing have been added to the Test Code Validation Form (STVTEC) in preparation for the GRE revised General Test and the associated scores and percentiles. New GRE tests will be administered in Fall 2011.

Test Code	Description	Number of Positions	Data Type	Min Score	Max Score	System Required
G03Q	GRE Revised General Quantitative	3	Numeric	130	170	Yes
G03V	GRE Revised General Verbal	3	Numeric	130	170	Yes
G03W	GRE Revised General Writing	3	Numeric	0.0	6.0	Yes

### Intended Graduate Major Field Code

The Intended Graduate Major Field Code field is used for 2010-2011 reporting. It is optional. This field is the same as the existing Department Code List field that was used for 2009-2010 reporting. The Department Code List field is used to capture the department at the score recipient's institution where the applicant wants their scores sent. It is optional. The Department Code List field (*MAJR\_CODE* field name in positions 37-40 in Banner) should be used until the revised General Test is delivered. It can be used to report a major if one exists.

When the revised General Test is introduced in Fall 2011, applicants will be required to respond to a question regarding their Intended Graduate Major. The data in the Intended Graduate Major Field Code and the Department Code List fields may not always match, but the fields should match in most cases. As the Department Code List field is not a required field, data for that field may not be received from every score recipient. Remember that not all students will take the revised General Test, so the Intended Graduate Major may not be reported.

To capture the Intended Graduate Major (once GRE reports this information in Fall 2011), you may change the *MAJR\_CODE* field name on SRATPFDD to use positions 71-74 and then discontinue the use of *MAJR\_CODE* in positions 37-40 for the Department List Code. The *MAJR\_CODE2* field name may then be added for positions 37-40, once both majors are being reported.

You will need to review GRE major codes in the following file: [http://www.ets.org/Media/Tests/GRE/pdf/gre\\_0910\\_online\\_bulletin.pdf](http://www.ets.org/Media/Tests/GRE/pdf/gre_0910_online_bulletin.pdf). You can then review and update codes for conversion on SOTCNVT for **Interface Type GRE** and **Validation Table Name MAJR**, when these changes take effect.

### Examinee's ISO Country Code

For the Examinee's ISO Country Code field, the *NATION\_CODE* field name (positions 329-331) is used on SRATPFDD. The *NATION\_NAME* field name is no longer used and has been removed from SRATPFDD.

Previously, the Nation Name field was translated and loaded to the *STREET\_LINE3* columns in the Banner temporary tables. Street Line 3 data has been added to the GRE as

part of the Examinee's Street Address field, so the Banner STREET\_LINE3 column is required for potential address information.

You will need to review GRE nation codes in the following file: [http://www.ets.org/Media/Tests/GRE/pdf/gre\\_0910\\_online\\_bulletin.pdf](http://www.ets.org/Media/Tests/GRE/pdf/gre_0910_online_bulletin.pdf). You can then review and update codes for conversion on SOTCNVT for **Interface Type GRE** and **Validation Table Name NATN**.

## Examinee's Telephone Number

The Examinee's Telephone Number field is twenty characters in length and uses positions 345-364 for the area code, phone number, and phone comment information. It is optional, numeric, and free format. The data is captured for the GRE as numbers. The GRE does not provide a telephone type.

The **Phone Comment** field in the Electronic Prospect Details block of SRAPREL is used for the comment information. This field is populated by the SRTTELE\_COMMENT column.

The GRE does not require that an examinee (either national or international) provide a telephone number. If a telephone number is provided, the GRE does not indicate whether the number is national or international. The country code and city code that precede an international telephone number are also optional. Codes of *1* or *011* can be used.

The Electronic Prospect Load (SRTLOAD) loads the first ten characters as the phone area code and phone number. If more than ten digits exist, all characters are loaded to the SRTTELE\_COMMENT column in the SRTTELE temporary table. The **Phone Comment** field in the Electronic Prospect Details block of the Electronic Prospect Detail Form (SRAPREL) is populated by the SRTTELE\_COMMENT column.

When SRTLOAD is run, a hierarchy value of "1" must be entered in the Telephone Type Code parameter as a prefix to the telephone type code, in order to load the GRE telephone number and type to Banner. For example, with the telephone type of *MA*, the prefix of *1* creates a value of *1MA*. You may choose to create a new telephone type to load GRE phone numbers using this parameter.

### Note

When duplicate Examinee Names appear in the file, GRE telephone numbers should *always* be identical. ■

## Tips for Loading GRE Phone Numbers

Here are some suggestions for loading phone numbers.

- Review the GRE reported phone comments on SRAPREL, after running SRTLOAD.
- Create a unique telephone type code for GRE phone numbers, and use the code in the Telephone Type parameter when SRTLOAD is run. This may assist with reviewing the GRE phone numbers.

- Use the SRRSRIN process for matching incoming records. Records set to *N* (New) do not have phone number data inserted or updated. SRRPREL logic can be used to load the phone number information. This ensures that existing phone comments are loaded to Banner.
- Contact the GRE for assistance in defining telephone data in the future, so it can be loaded to Banner as appropriate.

## Load Telephone Information

The GRE delivers an unformatted set of numbers up to 20 characters as the GRE phone number in positions 345-364.

SRTLOAD loads the first ten positions as the area code and phone number as defined on SRATPFD for the *PHONE\_AREA* (positions 345-347) and *PHONE\_NUMBER* (positions 348-354) field names. The data is loaded to the SRTTELE\_PHONE\_AREA and SRTTELE\_PHONE\_NUMBER columns in the SRTTELE temporary table.

SRTLOAD also evaluates if a digit exists in position 355 for the *PHONE\_COMMENT* field name (positions 355-364) on SRATPFD. If a digit exists in position 355, the entire GRE phone number from positions 345-364 is loaded to the SRTTELE\_COMMENT column in the SRTTELE temporary table. The phone number is preceded by the text *GRE Phone Reported*. This provides a reference to the origin of the phone number. This is displayed in the **Phone Comment** field on SRAPREL.

### Note

The Phone Comment field in the file may not always contain 20 digits. However any digits that exist beyond the first ten will be collected entirely as comments. ■

The SRKPREL package uses the value in the SRTTELE\_COMMENT column to populate the SPATELE\_COMMENT column when the *PHONE\_AREA* and *PHONE\_NUMBER* field name logic is set up to load the information to SPATELE. The telephone number is also loaded to SPATELE in this case.

The insert and update logic in SRTLOAD and SRKPREL used to load area code or phone number data has not been modified. Phone information is loaded based on the settings for the phone and address rules on SAAERUL.

## Match and Push Phone Information

This section discusses matching the telephone data and pushing it into Banner.

### *Manual Match for New ID with Manual Push*

When the match is performed manually and the **Create New** button on the Common Matching Entry Form (GOAMTCH) is selected, a new person record is created for the ID when phone number data exists. Records will not include telephone comments, even if

they exist. (A Banner General package creates the telephone data on GOAMTCH using Banner General tables, and no TELEPHONE\_COMMENT column exists for the update.)

When the manual push to Banner occurs through SRKPREL, if a new telephone number is created, the associated comment from the SRTTELE table will also be carried through the process. A new telephone number is not always created. The Banner General package applies the address type and sequence number, and sets the record to *Primary* if appropriate. When the data is pushed to Banner, SRKPREL checks whether the same telephone type, telephone number, and address type exist. If they do, the record is considered to be a duplicate, and the telephone number may not be pushed to Banner a second time.

#### ***Manual Match for Selected ID with Manual Push***

When the match is performed manually and the **Select ID** button on the Common Matching Entry Form (GOAMTCH) is used for an existing record that is a match, telephone records are not created.

When the manual push to Banner occurs through SRKPREL, if a new telephone number is created, the associated comment from the SRTTELE table will also be carried through the process.

#### ***Manual Match to Update ID with Manual Push***

When the match is performed manually and the **Update ID** button on the Common Matching Entry Form (GOAMTCH) is selected, telephone records may be created. Records will not include telephone comments, even if they exist. (A Banner General package creates the telephone data on GOAMTCH using Banner General tables, and no TELEPHONE\_COMMENT column exists for the update.)

When the manual push to Banner occurs through SRKPREL, if a new telephone number is created, the associated comment from the SRTTELE table will also be carried through the process.

#### ***Batch Process Match with Batch Push***

When the match is performed using the Electronic Prospect Match (SRRSRIN), telephone records are not created. When the push to Banner is performed using the Migrate Electronic Prospects Process (SRRPREL), SRKPREL processes the data the same way as the manual push process.

When the manual push to Banner occurs through SRKPREL, if a new telephone number is created, the associated comment from the SRTTELE table will also be carried through the process.

#### ***Batch Process Match with Manual Push***

When the match is performed using the Electronic Prospect Match (SRRSRIN), and the new records are pushed into Banner, SRKPREL processes the data, and telephone records

are created. New records can be queried on the Electronic Prospect Inquiry Form (SRIPREL).

When the manual push to Banner occurs through SRKPREL, if a new telephone number is created, the associated comment from the SRTTELE table will also be carried through the process.

## Recruiting Reports

---

This section contains a sample of each report in the Recruiting module. Parameter definitions are also provided for your convenience.

The following reports are run through the Recruiting module:

Rec/Enroll Analysis - How Learned Report	(SRRENRH)
Recr/Enrl Analysis - Source/Recr Report	(SRRENRL)
Recruits Never Applied to Inst. Report	(SRRINQR)
Communication Plan Processing Report	(SORCPLN)
Electronic Prospect Load	(SRTLOAD)
Electronic Prospect Purge	(SRTPURG)
Search Tape Matching Process	(SRRSRIN)
Migrate Electronic Prospects Process	(SRRPREL)
Electronic Prospect Email Process	(SRREMAL)

## Rec/Enroll Analysis - How Learned Report (SRRENRH)

**Description** This report is used to produce a statistical report of recruits, applicants, and enrollees by a How I Learned code for a term range. The data collected are based first on the prospect How I Learned About code and then on term. An optional section may be printed for How I Learned About codes which have no corresponding recruiting data associated with them.

**Note**

The App (Applied) column displays a count of those recruits that *exactly* match an applicant (SARADAP) for: PIDM, term, level, degree, and major. ■

Parameters	Name	Required?	Description	Values
	From Term	Yes	Enter the term code representing the term from which the recruiting enrollment analysis is to be run.	Term Code Validation Form (STVTERM)
	To Term	Yes	Enter the term code representing the term to which the recruiting enrollment analysis is to be run.	Term Code Validation Form (STVTERM)
	How I Learned About	No	Enter the code(s) for the source of the prospect contact, or enter % for all.	Web Prospect How I Learned About Validation Form (STVLEND)
	Recruiter Codes (Default = All)	No	Enter the code(s) for the recruiter(s) to be reported, or enter % for all.	Recruiter Code Validation Form (STVRECR)
	Print All How I Learned Codes	No	Enter <i>Y</i> to print the How I Learned About codes which have no associated recruiting records. Enter <i>N</i> to not print this section of the report.	Y Print codes N Do not print codes

## Report Sample—Recr/Enroll Analysis - How Learned Report (SRRENRH)

## Recr/ Enrl Analysis - Source/Recr Report (SRRENRL)

**Description** This report is used to produce a statistical report of recruits, applicants, and enrollees by source and recruiter for a term range. You may print an optional section for source codes which have no corresponding recruiting data associated with them.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	From Term	Yes	Enter the term code representing the term from which the recruiting enrollment analysis is to be run.	Term Code Validation Form (STVTERM)
	To Term	Yes	Enter the term code representing the term to which the recruiting enrollment analysis is to be run.	Term Code Validation Form (STVTERM)
	Source Codes (Default = All)	No	Enter the code(s) for the enrollment source(s) to be reported or leave blank for all sources to be included in the analysis.	Source/Background Institution Code Validation Form (STVSBGI)
	Recruiter Codes (Default = All)	No	Enter the code(s) for the specific recruiter information to be included or leave blank to include all recruiter information.	Recruiter Code Validation Form (STVRECR)
	Print All Source Codes (Y/N)	No	Enter <i>Y</i> to print the source codes which have no associated recruiting records. Enter <i>N</i> to not print this section of the report.	Y Print codes N Do not print codes

## Recruits Never Applied to Inst. Report (SRRINQR)

**Description** This report produces a list of recruits who have no admission records with a term that is greater than or equal to the recruit term specified in the Term parameter for the following conditions: where the level of the admissions application is the same as the level of the recruiting record, the primary curriculum degree, and major of the application, or the secondary curriculum degree and the major of the application are the same as the degree and the major of the recruiting term. If multiple recruiting records exist for a person within the same term, each recruiting record is individually compared to each admissions application that may exist for terms greater than or equal to the recruiting term. If any match is found based on the criteria described, the recruit will be selected.

This report is also used to delete recruiting records and high school, prior college, and prior test information. In addition, if the Delete Indicator parameter is selected, communication plans, sources, outside interests, cohorts, mail, and comments associated with the recruit will be deleted.

If the Print Indicator parameter is selected, the report output will include a listing of the recruits selected. If the Delete Indicator parameter is selected, the report output will contain only the report control information indicating the total number of recruiting records deleted.

Parameters	Name	Required?	Description	Values
	Term Code	Yes	Enter the term code representing the recruiting term for which you wish to run the report.	Term Code Validation Form (STVTERM)
	Delete High School Info (Y/N)	Yes	Enter <i>Y</i> to delete high school information; enter <i>N</i> to save high school information.	Y Delete high school information N Save high school information
	Delete Prior College Info (Y/N)	Yes	Enter <i>Y</i> to delete prior college information; enter <i>N</i> to save prior college information.	Y Delete prior college information N Save prior college information
	Delete Prior Test Info (Y/N)	Yes	Enter <i>Y</i> to delete prior test information; enter <i>N</i> to save prior test information.	Y Delete prior test information N Save prior test information
	(P)rint/(D)elete Indicator	Yes	Enter <i>P</i> to print the list of recruits without admission records. Enter <i>D</i> to delete the existing records.	P Print recruits without admission records D Delete existing records

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Contact Code	No	Enter the contact code(s) to be processed.	Contact Type Code Validation Form (STVCTYP)
	Source Code	No	Enter the source/background institution code(s) to be processed.	Source/Background Institution Code Validation Form (STVSBGI)
	Level Code	No	Enter the level code to be processed.	Level Code Validation Form (STVLEVL)

## Communication Plan Processing Report (SORCPLN)

**Description** This report is used to show a person's movement from an old communication plan to a new communication plan. Old plans may be inactivated or deleted, and old materials associated with plans may be deleted or saved.

**Note**

Please refer to the Communication Plan Processing information in the “Recruiting Procedures” section of this chapter for further detail on the use of this process. ■

Parameters	Name	Required?	Description	Values
	Sort Option	Yes	Enter the sort option for name (N) or ID (I).	N Name I ID
	Inactivate Old Communication Plans	Yes	Enter <i>I</i> to inactivate any old communication plans or <i>D</i> to delete old communication plans.	I Inactivate D Delete
	Delete Materials	Yes	Enter <i>Y</i> to delete materials associated with old communication plans. Enter <i>N</i> to save materials associated with old communication plans.	Y Delete old materials N Save old materials

## Electronic Prospect Load (SRTLOAD)

**Description** This process loads data from a search input file (for example, College Guide/SSS, PCU, or Peterson) or a test score report file (for example, SAT, ACT, GRE, or AMCAS), to the following temporary tables:

- SRTIDEN
- SRTPERS
- SRTTELE
- SRTADDR
- SRTTEST
- SRTPREL
- SRTHSCH
- SRTPCOL
- SRTEMAL
- SRTGPAT
- SRTCRESS
- SRTSUPL
- SRTDEGR
- SRTMAJR
- SRTTSPC

The data in these tables is available using the Search Tape View (SRVPREL) or SRAPREL. Detail is also available when accessing these loaded records on SRIPREL using the Detail [SRAPREL] item in the Options Menu. The SRTLOAD process also creates an audit report detailing the status of each record on the input file.

This process can be used to load positional files (SAT, GRE, etc.) and delimited files (AMCAS). It reads delimited input files based on whether rules for file delimiters or delimiters and markers exist in the SORDLIM table for a given tape code. The process will either look for the fields by position or by sequence number as defined on SRATPF in the SRRTPFD\_START\_POS field. The process refers to the STVTESS\_TESS\_CODE\_DATE\_ORIGIN field for test codes.

## Report Setup and SOTCNVT Rules

You should do the following in preparation for running SRTLOAD:

- If the input file is delimited, set up the delimiter (and optionally the marker) on SORDLIM for the tape code being used.
- Set up the corresponding interface (INFC) code and tape code values on STVPREL.
- Assign the appropriate matching source code to the interface code on STVINFC.
- Set up rules on SOTCNVT for the conversion of the tape values to the Banner validation table values.

The codes listed below are compared to SOTCNVT for conversion to Banner values and for default values.

If the code on the tape is blank, an asterisk ( \* ) value is matched against SOTCNVT. If the tape value is not blank, the incoming value is matched against SOTCNVT. If there is no available conversion for the tape value or the tape value is not valid on the Banner validation table, the literal DEFAULT is matched against SOTCNVT. If the literal DEFAULT is not available, then an error message is printed on the report.

On SOTCNVT, the following tables are validated:

- NATN
- CITZ
- STAT
- INTS
- INTP (PSAT only)
- ETHN
- ETHR (AMCAS only)
- DEGC
- DEGA (AMCAS only)
- MAJR
- MAJP (PSAT only)

- RELG
- CNTY
- TADM
- TERM
- DEPT
- VTYP
- EDLV
- EGOL
- ADMT (AMCAS only)
- TEAC (AMCAS only)
- TEFR (AMCAS only)
- SBGI (college code conversions)
- SBGH (high school code conversions)
- HGPA (SAT only)
- CAMP
- ESEL
- GNDR
- TESC
- TSPT

The exceptions for determining conversions and default values are for the major code, interest code, term code, level code, campus code, contact type code, source code, address type code, email type code, and telephone code. SRTLOAD will appropriately analyze the high school or prior college graduation date on the incoming file against rules on SOTCNVT to determine the term code, or it will use the term code entered in the SRTLOAD Term Code parameter.

If there is no match, the value from the Term Code parameter is used. The level code, address type code, telephone type code, and email code that is inserted will always be from the input parameter value. If no source code or contact type code are entered in the input parameters, the value from STVINFC for the interface will be used. In addition, the test score source inserted on test scores will be the one created on STVINFC.

The fields INTS and MAJR can have multiple values in multiple fields for some types of tape loads. The asterisk ( \* ) and DEFAULT functionality will only work on the first match attempt for the field MAJR(MAJR1). If there are values in fields MAJR2, MAJR3, or MAJR4, the process will attempt to match the values against the SOTCNVT crosswalk and the values in STVMAJR. If no match is found for these values, the output report will display an error indicating the field and the error. INTS will not use the asterisk ( \* ) or the DEFAULT functionality due to the possibility of many records existing on the incoming data file.

High school codes can be converted using the SBGH validation on SOTCNVT. If there is no high school conversion on SOTCNVT, the STVSBGI code will be used if there is a match. Non-high school codes cannot be entered using the SBGH validation on SOTCNVT. Colleges codes can be converted on SOTCNVT with SBGI validation, and if a code exists in STVSBGI, that code will be loaded.

The default values on SRAPRED are used when there are no SOTCNVT values *and* if the corresponding parameter on SRTLOAD is blank. When there are no SOTCNVT values and if the corresponding parameter on SRTLOAD is blank, SRTLOAD will first use the data that exists on the incoming tape for such fields as Term, Major, etc. If no value exists on the file, and the value does not convert on SOTCNVT, then SRTLOAD will use the data in the parameter. If no value exists in the parameter, SRTLOAD will use the value on SRAPRED. The Test Source will default in from STVINFC. The Tape Source and Contact Type fields will be populated from STVINFC, if there are no corresponding SRTLOAD parameter values. If no values exist on STVINFC, the values will default from SRAPRED where appropriate.

## Loading Data to Banner

When data is loaded to Banner, the load hierarchy is as follows:

1. Values from SOTCNVT, if they exist.
2. Values from the SRTLOAD parameters, if they have been entered.
3. Values from STVINFC (contact type and/or source code), if they exist, and if valid parameter values do not exist on SRTLOAD.

4. Values from SRAPRED, if they exist.

**Note**

For AMCAS, the student type will always need to be updated on SRAPRED for the level for which you are running SRTLOAD, so the required Student Type value is loaded for the applicant. ■

When matching nation codes, if no code exists on the tape and a nation description is provided, the nation description will be compared against the nation description in STVNATN. If there is an exact match, the nation code will be updated in the SRTNATN temporary table and can be loaded to Banner.

For example, when no SOTCNVT rules exist for STVNATN and the nation description is provided on the tape:

- Nation *Singapore* on tape will be translated and update SRTADDR\_NATN\_CODE = 133 when STVNATN code 133 = *Singapore*.
- Nation *Mexico* on tape will be translated and update SRTADDR\_NATN\_CODE = 99 when STVNATN code 99 = *Mexico*.
- Nation *Albania* on tape will be translated and update SRTADDR\_NATN\_CODE = 2 when STVNATN code 2 = *Albania*.
- However, *Bahamas* on tape would not be translated, as STVNATN code 10 = *The Bahamas*.

**Note**

The nation code will be loaded to Street Line 3, and there will be associated API errors because of the nation and the state. The record would need to be resolved manually on GOAMTCH prior to loading. ■

SRTLOAD will provide the following messaging based on the above examples:

Data Item	Nation Code	Message
NATN	99	<i>Nation found from description</i>
NATN	2	<i>Nation found from description</i>
NATN	133	<i>Nation found from description</i>
NATN	BAHAMAS	<i>Not In SOTCNVT, STVNATN</i>

## PCU Prior College Degree Tracking

SRTLOAD will update the prior college for the *UNKNOWNPCOL* rule on SAAERUL, when a current college name exists on the incoming file. If the *UNKNOWNPCOL* rule does not exist, no prior college will be loaded to the temporary table. No attempt will be made to convert the incoming PCU Current College Name field. (This field is a free format field from the PCU.) The field value may be selected from a pick list provided by the PCU or may be manually entered by the recruit or prospect.

Due to the variety of data entry options (selecting a college name or manually entering the data), no attempt will be made to compare the incoming PCU Current College Name value against the description in STVSGBI to avoid corrupt, incorrect, or incomplete data. Data can be corrupt, incorrect, or incomplete due to: the absence of an incoming college code to be used for conversion to Banner, the PCU value length of 100 characters (in contrast to the 30 character description length on STVSBGI), as well as potential misspellings, abbreviations, and formatting and data inconsistencies related to manual entry.

Use the PCU Prior College Degree Code parameter for prior college degree tracking. You can enter the degree code that will be applied to the prior college record for PCU processing. The parameter is validated against the Degree Code Validation Form (STVDEGC).

The PCU file provides a prior college GPA, but it does not provide a degree code. If the prior college GPA exists, it cannot be loaded without an associated degree and/or degree sequence number. The degree GPA also requires the existence of the *UNKNOWNPCOL* rule on SAAERUL. The PCU Prior College Degree Code parameter will provide a degree code that is loaded to the SRTDEGR/SORDEGR tables when a prior college GPA and an incoming current college name exist. When the degree from the parameter and the GPA are loaded, the degree will not be flagged as primary, since the PCU does not provide that information in the file. The degree will not be loaded without an existing GPA.

### Note

No college or degree information will be loaded without an *UNKNOWNPCOL* rule in SAAERUL. If it is preferred no PCU college, degree, or GPA data be loaded to Banner, this rule may be removed from SAAERUL. ■

## PCU Processing and Output

SRTLOAD will perform the following during PCU processing:

- It will load the student type value to the SRTPREL\_STYP field in Banner.

- It will load the incoming high school GPA to the `SRTHSCH_GPA` field in Banner. A high school code must exist for conversion or default, or the incoming high school GPA will not be loaded.
- It will load the incoming prior college GPA to the `SRTPCOL_GPA_TRANSFERRED` field in Banner. The prior college GPA will not be loaded unless the `UNKNOWNPCOL` rule has been set up on `SAAERUL`, and the PCU degree has been entered in the PCU Prior College Degree Code parameter in `SRTLOAD`.

Prior to the optional Summary Report in the `SRTLOAD` output, a list of ID numbers is printed from the incoming PCU file for records with the student type of *O*. (Please note that you may have chosen a different student type for these records on `SOTCNVT`.) This list of IDs can be used to review the records on `SRIPREL`. The records with a student type of *O*, as well as any other records, can then be loaded manually or processed using `SRRSRIN` and/or `SRRPREL`.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Data File Name	Yes	Enter the path and file name containing the search tape records or test score tape records to be loaded (for example, <code>/tmp/search.data</code> ).	
	Electronic Prospect Code	Yes	Enter the electronic prospect code to be used in the load.	Electronic Prospect Validation Form (STVPREL)
	Tape ID	No	Enter the additional ID of the tape, which is useful if multiple tapes are being loaded for the same electronic prospect code.	
	AMCAS School Number	No	Enter the AMCAS school code to be processed in the load.  This parameter is optional for all incoming AMCAS files. If there are multiple school numbers on the incoming file, the parameter will sort the data by the school number entered and only process those records. If this parameter is left NULL, then all records on the file will be processed.	

Parameters	Name	Required?	Description	Values
	SSN or Generated ID	Yes	<p>Enter <i>S</i> to use the SSN from the data file or <i>G</i> to always generate a new ID.</p> <p><b>Note:</b> If the ID is generated or the incoming data is all zeros (as is the case with some ACT records), the process will display <i>GEN</i> in the ID field on the output report when the report is executed in audit mode. The actual generated IDs will display on the output report when the report is executed in update mode.</p>	<p><i>S</i> Use SSN from data file</p> <p><i>G</i> Generate a new ID</p>
	Term Code	No	Enter the term code that will be used if a term code cannot be determined from the high school graduation date on the search or test score tape and the SOTCNVT conversion rules, or if no term has been entered on SRAPRED.	Term Code Validation Form (STVTERM)
	Level Code	Yes	Enter the level code that will go on the prospect's recruit record.	Level Code Validation Form (STVLEVL)
	Campus Code	No	Enter the campus code that will go on the prospect's recruit record.	Campus Code Validation Form (STVCAMP)
	AMCAS Degree Code	No	<p>Enter the degree code for the prospect record.</p> <p>This parameter is optional for all tapes except AMCAS. AMCAS requires the degree code for the application.</p> <p>AMCAS applications will not have a degree code if: this parameter is not entered, the incoming AMCAS APPL_TYPE does not have a corresponding conversion on SOTCNVT for validation table name <i>DEGA</i>, or a degree has been entered for the level code on SRAPRED for which SRTLOAD is run.</p>	Degree Code Validation Form (STVDEGC)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	AMCAS Major Code	No	<p>Enter the major code for the prospect/application record.</p> <p>This parameter is optional for all tapes except AMCAS. AMCAS requires the major code for the application when SRTLOAD is run for the electronic prospect code <i>AMCS</i>.</p> <p>If no AMCAS major code is entered for this parameter, you must have a major code listed on SRAPRED for the level code for which you are running SRTLOAD. SRTLOAD will indicate a missing major for AMCAS on the log file, and the process will terminate if no AMCAS major is found on SRTLOAD or SRAPRED.</p>	Major, Minor, Concentration Code Validation Form (STVMAJR)
	Department Code	No	<p>Enter the department code for the prospect record.</p> <p>AMCAS files do not provide for a department code. You can establish the department code for AMCAS applicants using this parameter or entering a department code value on SRAPRED for the level for which you are running SRTLOAD.</p> <p>If department code is required for curriculum processing at your institution, the department code is needed for the application to be processed correctly whether it is updated via the SRTLOAD parameter or using SRAPRED.</p>	Department Code Validation Form (STVDEPT)
	Contact Code	No	Enter the contact code that will go on the prospect's recruit record.	Contact Type Code Validation Form (STVCTYP)
	Source Code	No	Enter the source/background institution code that will go on the prospect's recruit record.	Source/Background Institution Code Validation Form (STVSBGI)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Address Type Code	Yes	Enter the address type code for the prospect's address to be used. If no value is entered, <i>MA</i> is the default.	Address Type Code Validation Form (STVATYP)
	Address Source Code	Yes	Enter the address source code for the prospect's recruit record.	Address Source Validation Form (STVASRC)
	Telephone Type Code	No	<p>Enter the default telephone type code for the prospect's recruit record. For all tape loads, this code <i>must</i> be preceded by an occurrence number.</p> <p>When the Telephone Type parameter is NULL, the telephone type that is loaded with the telephone number should be the telephone type that is associated with the address type on STVATYP.</p> <p>When the Telephone Type parameter is NULL, and no corresponding STVATYP value exists for the telephone type, the telephone type that is loaded should match the address type code, as long as it is also a valid STVTELE code.</p> <p>If none of the above is true, then the default telephone type is <i>MA</i>.</p>	Telephone Type Validation Form (STVTELE)
	Email Type Code	No	Enter the email type code for the prospect's email.	E-mail Address Type Validation Form (GTVEMAL)
	Print Test Scores	Yes	Enter <i>Y</i> to print test scores on the report while processing test score records. Enter <i>N</i> to suppress printing test scores.	<p>Y Print test scores</p> <p>N Do not print test scores</p>
	Default Test Month	No	Enter the default month for the test. Valid values are 01 - 12.	

Parameters	Name	Required?	Description	Values
	Print County Code Errs (AMCAS)	Yes	<p>Enter <i>Y</i> to print validation errors for the county for AMCAS processing or <i>N</i> to not print validation errors. The default is <i>Y</i>.</p> <p>This option is provided since many county codes exist that do not validate and could needlessly create a long report with many redundant errors.</p> <p>This parameter is optional for all tapes except AMCAS.</p>	<p><i>Y</i> Print validation errors</p> <p><i>N</i> Do not print validation errors</p>
	Print Validation Summary	Yes	<p>Enter <i>Y</i> to print the validation summary or <i>N</i> to not print the validation summary. The default is <i>Y</i>.</p> <p>SRTLOAD checks for non-validated codes for each pidm/ID and prints a summary by validation table/code at the end of the report for more efficient viewing and correction of errors. This summary prevents the need to search through each ID and view duplicate errors.</p> <p>SRTLOAD should first be run in Audit Mode so that reported validation errors can be reviewed. When the errors are resolved, SRTLOAD should be re-run in Audit Mode to be sure all validation errors have been resolved, prior to running the report in Update Mode.</p>	<p><i>Y</i> Print validation summary</p> <p><i>N</i> Do not print validation summary</p>
	Run Mode	Yes	<p>Enter <i>U</i> to update the database or <i>A</i> to run an audit report.</p> <p><b>Note:</b> Run the process in Audit Mode to determine which values are missing from Banner (for example, high school codes, major codes). If these values are not created in Banner and converted using SOTCNVT where appropriate, the value will not be loaded into Banner.</p>	<p><i>U</i> Update the database</p> <p><i>A</i> Produce audit report</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Effective Date (AMCAS)	No	Enter the effective date for which AMCAS records should be loaded. Records having a date that is greater than or equal to this date will be loaded.	
	PCU Prior College Degree Code	No	Enter the degree code to be applied to the prior college record for PCU processing.	Degree Code Validation Form (STVDEGC)

## Electronic Prospect Purge (SRTPURG)

**Description** This process is used to delete records from the search tape and test score temporary tables. This process allows you to designate which records to purge. All data associated with search tape, test score tape, or PCU records is deleted based on the following parameter values.

### For PCU Processing

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (STVSTYP).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded (not entered in this parameter), they can be manually reviewed and pushed (or not) on SRIPREL and/or purged using SRTPURG. This allows you to selectively process or not process PCU student types.

If NULL student types need to be processed, all applicable student types should be processed first, so that only the NULL types remain. Leave the Student Type parameter blank, and the NULL student types will be picked up, as they will be the last types that remain during processing.

#### Note

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be *NULL*, or they will use the default student type for the specific electronic prospect code that was updated on SRAPRED. ■

Parameters	Name	Required?	Description	Values
	Electronic Prospect Code	Yes	Enter the electronic prospect code to be used in the purge.	Electronic Prospect Validation Form (STVPREL)
	Tape ID	No	Enter the additional ID used to identify the tape during the load process.	
	Term Code	No	Enter the term code of the prospect records to be purged.	Term Code Validation Form (STVTERM)

Parameters	Name	Required?	Description	Values
	Level Code	No	Enter the level code of the prospect records to be purged.	Level Code Validation Form (STVLEVL)
	Date Added	No	Enter the date the record was loaded to the temporary tables via SRTLOAD.	
	Match Status	No	Enter the match status to indicate that only records with this match status should be purged.	
	Load Status	No	Enter the load status to indicate that only records with this load status should be purged.	
	Date Loaded	No	Enter the date when records to be purged were originally loaded into Banner.	
	Print Detail on Report	No	Enter <i>Y</i> to print the detail or <i>N</i> to not print the detail.	Y Print detail N Do not print detail
	Run Mode (A = Audit, U = Update)	Yes	Enter <i>U</i> to update the database or <i>A</i> to run an audit report. <b>Note:</b> Run the process in audit mode to determine which records will be removed from the temporary tables.	A Audit U Update
	Student Type	No	Enter the student type codes to be purged or leave blank for all student types.	Student Type Code Validation Form (STVSTYP)

## Electronic Prospect Match (SRRSRIN)

**Description** This process is used to determine if a match exists between a record on the Search Tape View (SRVPREL) and Banner production data when search, test score tape, PCU, or AMCAS records are loaded in mass. Users should review how Common Matching works with electronic prospect processing when using SRRSRIN and SRRPREL.

The process uses the interface code, its corresponding matching source code, and the rules established on the Common Matching Rules Form (GORCMRL) to determine if a record on SRVPREL has a match in Banner. The process runs against all records in SRVPREL that have a match status of null and a load status of null. This assumes that if you change the matching rules on GORCMRL, you are not able to re-match someone on SRVPREL who has already been matched, because the person's match status will no longer be null. This process sets the match status on SRVPREL to either *N* (New), *M* (Matched) *S* (Suspense), *D* (Duplicate), or *E* (Error). The *S* and *D* records can be viewed and updated on the Common Matching Entry Form (GOAMTCH) which is accessed from the Electronic Prospect Inquiry Form (SRIPREL).

### Duplicate Processing

SRRSRIN will mark tape records as duplicates (*D*) when it finds matching information for the same tape ID. Duplicates can result from having multiple records delivered on a single tape for a student. Students can submit more than one request to send a report to your institution within the same reporting period. Students may also take a test more than once and not provide consistent identifying information. Duplicates can also result if SRTLOAD is run more than once with the same tape ID, and the matching process is not executed between loads.

#### *For example:*

1. Records are loaded by SRTLOAD with PREL code SAT and tape ID of sat1.
2. For some reason the matching process is not run, and the records not purged. They remain unprocessed in the temporary tables.
3. SRTLOAD is run again for the same tape PREL code SAT and tape ID of sat1.
4. When the matching process is run, each of the IDs can be flagged as duplicate.

The Auto Load (Skip Dup Chk) parameter is used to bypass the flagging of duplicates by SRRSRIN and to automatically load records to Banner. Auto load processing replaces the manual processing of matching and loading those duplicates on SRIPREL. When the Auto Load (Skip Dup Chk) parameter is set to *Y*, the

matching process is invoked, and *NEW* or *MATCHED* prospects are flagged. Those prospects are immediately loaded to Banner. Duplicate checking does not occur.

## Using the Auto Load Parameter

When the Auto Load (Skip Dup Chk) parameter is set to *N*, records will be flagged with a match status only. The records are not loaded to Banner until SRRPREL is run once the match status codes have been applied by SRRSRIN. When the Auto Load (Skip Dup Chk) parameter is set to *Y*, a match status is determined, *and* the records will automatically be loaded to Banner.

SRRSRIN will not load recruits to Banner when the Auto Load (Skip Dup Chk) parameter is set to *Y*, if data does not conform to API restrictions. When records with a matched (*M*) or new (*N*) status are flagged, the records will not be loaded to Banner when the Auto Load (Skip Dup Chk) parameter is set to *Y* if information required to create the record (such as an address) is incomplete.

SRRSRIN will flag records with incomplete addresses or other incomplete information as having a status of suspense (*S*), and these suspended records will need to be fixed manually on SRIPREL and GOAMTCH. If the incomplete data is not corrected, SRRSRIN will not load incomplete/incorrect records to Banner and will continue to change the match status back to *S* until the issue is resolved.

### Note

SRRSRIN is the only process that generates records with a match status of *N*. All records that are processed manually on SRIPREL using GOAMTCH will have a match status of *M*, even when you choose to create a new record. This is due to the fact that when you return to SRIPREL, the person's record will have been created in Banner by GOAMTCH. ■

Here is an example of SRRSRIN output when incomplete addresses are found after the process is run with the Auto Load (Skip Dup Chk) parameter set to *Y*.

ID	Name	Status	Term	Level	Major	High School	Result
P00002378	Adams, Adam	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00024505	Adams, Alison	M	199510	UG	ARTS	UNKNHS	Loaded 29-NOV-2004
P00002429	Adebowale, Morayo	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00027348	Albert, Dawn	M	199510	UG	ARTS	UNKNHS	Loaded 29-NOV-2004

When SRRSRIN is run with the Auto Load (Skip Dup Chk) parameter set to *N*, (and the load process will later be accommodated by SRRPREL), there is no address check, so records will be flagged as matched (*M*) or new (*N*), whether they have complete address information or not.

Since records on a tape with incomplete data such as incomplete addresses will not be loaded to Banner, SRRPREL works so that records that were flagged *N* or *M* and also have incomplete data will have the match status changed to *S*. Again, these suspended records will need to be fixed manually on SRIPREL and GOAMTCH. It is very important to fix the incorrect and/or missing information at this point, prior to continuing the matching process. If the incomplete data is not corrected, SRRSRIN will not load the incomplete records.

Here is an example of SRRPREL output when incomplete addresses are found after SRRSRIN is run with the Auto Load (Skip Dup Chk) parameter set to *N*.

ID	Name	Status	Term	Level	Major	High School	Result
A00023291	Abrams, Anthony	S	199510	UG	ARTS	UNKNHS	Prospect not loaded
A00024505	Adams, Alison	M	199510	UG	ARTS	UNKNHS	Loaded 30-NOV-2004
A00027662	Martinez, Robert	S	199510	UG	ARTS	UNKNHS	Prospect not loaded

When using SRIPREL, if an attempt is made to load a matched (*M*) or new (*N*) record (the Create Recruit item is selected from the Options Menu), and data is incomplete, an error is displayed in the autohint: *Error: Data Error. Prospect has been put into suspense*. At this point the match status for the record is changed back to *S*. You can then navigate to GOAMTCH to update the incomplete data (such as missing address information) and match the record appropriately.

### Using the Auto Load (Skip Dup Chk) parameter with PCU processing

If the Auto Load (Skip Dup Chk) parameter is set to *N* (perform duplicate processing), and the Student Type parameter is updated, a match status will be assigned for the student types that have been entered. When the Student Type parameter is blank, a match status will be assigned to all student types.

If the Auto Load (Skip Dup Chk) parameter is set to *Y* (load new and matched IDs), and the Student Type parameter is updated, a match status will be assigned for the student types that have been entered, and the records will be loaded to Banner. When the Student Type parameter is blank, a match status will be assigned to all student types, and the records will be loaded to Banner.

## Using PCU Processing

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (STVSTYP).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded (not entered in this parameter), they can be manually reviewed and pushed (or not) on SRIPREL and/or purged using SRTPURG. This allows you to selectively process or not process PCU student types.

If NULL student types need to be processed, all applicable student types should be processed first, so that only the NULL types remain. Leave the Student Type parameter blank, and the NULL student types will be picked up, as they will be the last types that remain during processing.

### Note

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be *NULL*, or they will use the default student type for the specific electronic prospect code that was updated on SRAPRED. ■

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Electronic Prospect Code	Yes	Enter the electronic prospect code to determine which records in the Search Tape View (SRVPREL) will be processed.  This parameter works with STVPREL and STVINFC to associate the tape with the common matching source for the appropriate matching rules.	Electronic Prospect Validation Form (STVPREL)
	Tape ID	No	Enter the code for the prospect tape ID to further define which records to process.	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Report Type (if Parm 04 = N)	Yes	Enter the report type value for the detail you wish to show on the report - <i>E</i> (errors), <i>N</i> (new), <i>M</i> (match), or <i>A</i> (all).	E Errors N New M Match A All
	Auto Load (Skip Dup Chk)	Yes	Enter <i>Y</i> to automatically load new or matched IDs or <i>N</i> to perform duplicate processing. The default is <i>N</i> .	Y Load new/matched IDs N Perform duplicate processing
	Student Type	No	Enter the student type codes to be processed or leave blank for all student types.	Student Type Code Validation Form (STVSTYP)

# Migrate Electronic Prospects Process (SRRPREL)

**Description** This process is used to create or update Banner recruiting and admissions records for the records in the search tape temporary records, including AMCAS and PCU records, depending on how the parameters are set. SRRPREL processes all search, test score tape, and AMCAS records that have a match status of *N* (New), *M* (Matched), or *A* (All) or rows with a match status set to *M* or *N* (depending on the parameter value selected). Once a record has been loaded, its load status is set to *C*.

The source and contact codes identified as parameters on the SRTLOAD process are loaded to the new or updated recruiting or admissions records based on the values for these rules on the Electronic Admissions Application Rules Form (SAAERUL). If no values are entered for these parameters in the SRTLOAD process, the values entered on STVINFC will be used. SRRPREL allows for the update of an existing recruiting or admissions record instead of always creating a new recruiting record if you request that additional information be loaded. Default values from SRAPRED will be used if they have been set up.

Use the *CREATENEWAPPL* rule on SAAERUL for the group equal to *PREL* to create an application record at the same time a recruit record is created by SRRPREL. When this rule is set to *Y*, the `sakmods.p_create_application` package is called to create an application record. When this rule is set to *N*, a corresponding application record is not created.

## For PCU Processing

You can run this process by student types, using the Student Type parameter. This parameter is optional, and multiple values may be entered. If left blank, all incoming student types will be processed for the prospect code and tape ID. The parameter is validated against the Student Type Code Validation Form (STVSTYP).

For each student type code that is entered in the parameter, only records on the incoming file with matching student types will be processed. When specific student types are excluded (not entered in this parameter), they can be manually reviewed and pushed (or not) on SRIPREL and/or purged using SRTPURG. This allows you to selectively process or not process PCU student types.

If NULL student types need to be processed, all applicable student types should be processed first, so that only the NULL types remain. Leave the Student Type parameter blank, and the NULL student types will be picked up, as they will be the last types that remain during processing.

### Note

The Student Type parameter is used mainly for PCU processing, but it is valid for all electronic prospect codes. Only the PCU file currently provides an incoming variable for the student type.

Student type values for other files (SAT, ACT, etc.) will be *NULL*, or they will use the default student type for the specific electronic prospect code that was updated on SRAPRED. ■

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Electronic Prospect Code	Yes	Enter the electronic prospect code of the records to be migrated to Banner.	Electronic Prospect Validation Form (STVPREL)
	Tape ID	No	Enter the code for the prospect tape ID or leave blank to load all records with the specified electronic prospect code.	
	Match Status	Yes	Enter <i>M</i> to select only matched rows, <i>N</i> for new rows, or <i>A</i> for all rows.	M Matched rows N New rows
	Student Type	No	Enter the student type codes to be processed or leave blank for all student types.	Student Type Code Validation Form (STVSTYP)

## Electronic Prospect Email Process (SRREMAL)

**Description** This process is used for sending out a mass mailing as an email letter to any individual with an electronic prospect record.

This process selects the processing population from the Electronic Prospects View (SRVPREL). For each electronic prospect processed, an email will be created based on the email letter defined on SOAELTR. This process requires that the letter defined on SOAELTR have a module type of *P*. The module type is defined for the letter on SOAELTL.

This process lists all persons selected from SRRPREL. If the electronic prospect does not have an email address, a missing email error message is printed. No email can be sent to these individuals, and a paper letter will need to be sent. This process does not report the emails returned due to invalid email addresses. That information will be returned to the in-box of the “from” email address which is the ID that processes the job through Banner job submission.

The From Email Address will default to “jobsub” if the process is run from job submission and the From Email Address parameter is left blank or the operating system is VMS, or will default to the user ID of the person running the process from the operating system prompt. Use the FROM Email Address parameter to indicate a from address other than “jobsub” or an Oracle ID.

This process requires that email can be sent from the server where the process is run. This process has the option of testing the email process. If the process is submitted with the Print to Log parameter set to *L*, the email messages will be printed to the log file and not sent.

The email letter itself is written to a disk file in ASCII format. The available formatting on SOAELTR includes a new line and new paragraph. If a row in SOAELTR has a new line format, and a data column which expands to blanks, and no text, the blank line will not be printed. The horizontal rule format option is not available for the ASCII email letter. This is available for the Web Admissions Signature Page.

### Note

This process uses the *sendmail* command on UNIX and VMS platforms. ■

The following errors may be encountered when using the `sokemal.p_sendmail` package with the SOKEMAL procedure, both of which use the Oracle API `UTL_SMTP`.

- *ORA-20001: 421 Service not available*

This indicates that the mailhost entered is not correct. Please check with the system administrator for assistance in obtaining the correct mailhost name.

- *ORA-20002: 550 5.1.1 jdoe@xxx.com... User unknown*

This indicates that the email address being sent is invalid. The email processes (SAREMAL, SOREMAL, and SRREMAL) will not stop running. The error will print in the detail on the report output.

- *ORA-29540: class oracle/plsql/net/TCPConnection does not exist*

This indicates that the correct java classes are not installed. Please refer to Chapter 65 of the *Oracle8i Supplied PL/SQL Packages Reference Release 2 (8.1.6) (Part# A76936-01)* for more information.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Email Letter Code	Yes	Enter the email letter code defined for the electronic prospect email letter.	HTML Letter Rules Form (SOAELTL)
	Electronic Prospect ID	No	Enter the ID of the electronic prospect when you are running the process for a single ID.	
	PREL Code	No	Enter the code for the electronic prospect or leave blank for all.	Electronic Prospect Validation Form (STVPREL)
	Tape ID	No	Enter the tape ID for the tape ID for the electronic prospect records to be included or leave blank for all.	
	Term Code	No	Enter the term code for the electronic prospect records to be included in the email processing.	Term Code Validation Form (STVTERM)
	Creation Start Date	No	Enter the start date when the prospects were created in MON-DD-YYYY format.	
	Creation End Date	No	Enter the end date when the prospects were created in MON-DD-YYYY format.	
	Load Status	No	Enter the load status for the prospect records to be included. Enter <i>C</i> for loaded to Banner or leave blank for not loaded to Banner.	<i>C</i> Loaded to Banner Blank - Not loaded to Banner

Parameters	Name	Required?	Description	Values
	Print Email to Log or Send	No	Enter <i>L</i> to print the email to a log file and not send it. Enter <i>S</i> to send the email to the student. The default is <i>S</i> .	<i>L</i> Print to log <i>S</i> Send email
	Email Subject Text	No	Enter the subject text for the email.	
	FROM Email Address	Yes	Enter the from email address for the email letter with the user ID and host (i.e., jdoe@college.edu). The default address is the one for the ID that is running the process.  <b>Note:</b> The email address is not validated by the TCP connection. You can enter an invalid email address, and the email will still be sent.  This parameter is required for use with the Oracle Mail API.	
	Email Sender's Name	No	Enter text to show the name of the sender as well as the email address in order to personalize the email. For example, enter "John Doe" <jdoe@college.edu> as the sender instead of jdoe@college.edu. This parameter is used with the FROM Email Address parameter.	
	Mail Host	Yes	Enter the mail host from which the email will be sent (i.e., mailhost.xxx.edu). This information is available from the system administrator and is the name of the mail TCP Connection.

# 10 Admissions

## Admissions Procedures

---

### Build Admission Credentials

The required admissions documents for categories of applicants are built on the Admissions Checklist Rules Form (SAACHKB) based upon institution policies. If the data built to define the rules matches the applicant's data when an application is entered on the Admissions Application Form (SAAADMS), the system automatically identifies and records items the applicant must submit to the institution to continue application processing. These items can be viewed and updated in the Checklist window of the Admissions Application Form (SAAADMS).

If you create a high school, prior college, test, or international record with a checklist item, and then create an application for that person, but the checklist defined on SAACHKB for that applicant's program does not include the checklist entered on the source form (SOAHSCH, SOAPCOL, SOATEST, or GOAINTL), then the checklist item will be created on the application and marked as received.

***For example:***

1. Create an admissions request checklist code of HS90 on STVADMR.
2. Create a high school record for the person, and add HS90 as the checklist item.
3. Set up checklist rules for UG, BA - Major MATH as high school transcript HST1 and test score TSTS on SAACHKB.
4. Create an application for the person with the checklist code of HS90. The checklists created will be for HST1, TSTS, and HS90.

Checklist processing records the origin or source of a checklist item, specifically if the item is from an external source, and tracks the status of the checklist item. The new source or checklist origin will be populated with the value *BASELINE* when a checklist item is created. This value can be changed if the checklist item was not automatically generated by system. The checklist origin code is displayed on SAAADMS and SAAACKL.

Checklist status codes can be used to communicate additional information to a student about a requirement. The checklist status code is displayed on SAAADMS and SAAACKL.

For example, a high school transcript has been received by an institution, but an updated transcript is needed that reflects additional semesters of coursework. A document status that indicates that an updated transcript is needed with the 7th semester grades provides the necessary detail to the staff and applicant.

In another example, an unofficial transcript is received by an institution. The applicant needs to be informed that the transcript was received, but an official transcript is required. The document status can also be used to communicate this requirement to the applicant.

## Build Automated Decision Rules

The Admissions Decision Rules Form (SAADCSN) is used to enter the institution's admission policies to be used by the system when calculating a decision on an applicant. Application information, including residency, level, student type, college, degree, major, program, and campus is entered on this form and is then compared to the admissions application data. Rules are also defined to compare high school information, prior college information, test scores, and ratings against data submitted by the applicant. You can design automatic decision rules for applicants with the level of complexity you require.

A procedure in the SAKDCSN package is used to process the rules for all application decisions. This procedure is called by all the processes that allow entry of a decision, such as SAADCRV, SAADCBT, SARBDSN, and the Admissions module of Banner® Student Self-Service. The Admissions Decision API is used with the Admissions Application Repeating Table (SARADAP). This API is called by the procedure that is used to process admissions application decisions.

### `sakdcsn.p_process_decsn`

The Application Decision Procedure (`sakdcsn.p_process_decsn`) is used to house the business logic for processing admissions application decisions. All processes that allow you to insert a decision code call this procedure. The one exception to this is SAAQUIK, which uses the API to insert the decision.

This procedure will perform the following activities for each new decision:

1. Validate that the last decision for the application does not have the same decision code.
2. Verify the existence of a general student record and return a warning, if appropriate.
3. Check for the existence of registration records and return either a warning or an error message, if appropriate.
4. Validate the curriculum.
5. Insert a decision, if appropriate.

6. Insert a general student record, if appropriate.
7. Copy the curriculum and field of study, if appropriate.
8. Push the application field of study to a new curriculum status, if appropriate.

Although an institution can define an unlimited number of admission decision codes, there are essentially six different types of codes: *Significant*, *Not Significant*, *Institutional Acceptance*, *Institutional Rejection*, *Applicant Acceptance*, and *Inactive Application*. This piece of logic will define the necessary validations to be performed, warning/error messages to be displayed, and other actions to be taken when a decision code is to be inserted into the SARAPPD table. Also, when the decision code being entered is an Applicant Acceptance type, the logic will determine the priority value associated with the learner curriculum record(s) to be inserted into the SORLCUR table.

### Significant Decision Codes

The **Significant Decision** checkbox is checked on STVAPDC. The decision code should be inserted into the SARAPPD table, and the **Application Status** field updated to *D*.

#### Note

The **Significant Decision** checkbox on STVAPDC can be checked (set to *Y*) independently of each of the other checkboxes on the form. As such, when it is checked in combination with any of the other checkboxes, updating the **Application Status** field to *D* should be part of that decision code type's processing as well. ■

### Not Significant Decision Codes

The **Significant Decision** checkbox is not checked on STVAPDC. The decision code should be inserted into the SARAPPD table without performing additional validation or updates.

### Institutional Acceptance Decision Codes

The **Institution Acceptance** checkbox is checked on STVAPDC. The decision code should be inserted into the SARAPPD table without performing additional validation or updates.

### Inactive Application Decision Codes

The **Inactive Application** checkbox is checked on STVAPDC. Before a new record is inserted into the SARAPPD table, the system should perform the following checks.

1. If the applicant has registration records in the same term as the entry term on the application, then:
  - 1.1. Display a warning message that registration exists, but no general learner record update is allowed.
  - 1.2. Execute the package to push the appropriate curriculum status codes on the application curriculum.
2. If the applicant does not have any registration records for the application term, but a general learner record exists for the application entry term, then:
  - 2.1. If all current and active learner curricula are the same as the current and active curricula on the application, then:
    - 2.1.1. Update the student status on the general learner record to *IS*.
    - 2.1.2. Display a warning message that learner records were inactivated.
    - 2.1.3. Execute the package to push the appropriate curriculum status codes on the application curriculum.
    - 2.1.4. Execute the package to push the appropriate curriculum status codes on the learner curriculum.
  - 2.2. If some, but not all of the current and active learner curricula match the current and active curricula on the application, then:
    - 2.2.1. Display a warning message that learner records were not inactivated and more than one current/active learner curriculum record exists.
    - 2.2.2. Execute the package to push the appropriate curriculum status codes on the application curriculum.
  - 2.3. If none of the current and active learner curricula match the current and active curricula on the application, then:
    - 2.3.1. Display a warning message that other learner curricula exist and learner and curriculum records were not inactivated.
    - 2.3.2. Execute the package to push the appropriate curriculum status codes on the application curriculum.
3. If no registration records exist and no general learner record exists for the entry term on the application, then:
  - 3.1. Display a warning message that the decision was processed.
  - 3.2. Execute the package to push the appropriate curriculum status codes on the application curriculum.

## Applicant Acceptance Decision Codes

The **Applicant Acceptance** checkbox is checked on STVAPDC. Before a new record is inserted into the SARAPPD table, the system should perform the following checks.

1. Obtain the error severity values on SOACTRL from the **Inactive current curriculum in same term, Inactive Current curriculum in previous term, and Cause a curriculum overload** fields.
2. If the applicant has registration records in the same term as the entry term on the application, compare the priorities on all current and active curricula on the application to the learner's current and active primary curriculum.

At this point, the process will not allow a decision to be processed if the curriculum from the application replaces the primary learner curriculum, as this would have an impact on the assessment of fees.

- 2.1. If the priority on any current and active curriculum on the application is less than the priority on learner's current and active primary curriculum, do not allow the decision to be entered, and display a fatal error message.
- 2.2. If the priority on all current and active curricula on the application is greater than the priority on the learner's current and active primary curriculum, allow the decision to be entered and continue with the next check.
3. Check for the existence of a previous applicant acceptance decision for the application.
  - 3.1. If the most recent significant decision is not an institutional rejection or inactive application decision, do not allow the decision to be entered, and display a fatal error message.
  - 3.2. If the most recent significant decision is an institutional rejection or inactive application decision, and the status on the general student record is inactive, then:
    - 3.2.1. Update the status on the general student record to active.
    - 3.2.2. For each current and active curriculum on the application, if the **Application Preference** value is not null, calculate the priority for the learner curriculum records using the following formula.

$( \text{Application Preference Number} \times 10 ) + ( \text{Curriculum Priority Number} )$

SARADAP\_APPL\_PREFERENCE

SORLCUR\_PRIORITY\_NO from the application being processed

- 3.2.3. If the **Application Preference** value is null, copy the priority for the learner curriculum records from the priority values on the application's curriculum records.
  - 3.2.4. Validate the curricula and display the appropriate type of message based upon the error severity settings obtained from SOACTRL and whether the calling program requires processing of curriculum. (SARBDSN does not require processing of curriculum.) If the error severity is *Fatal*, exit the procedure.
  - 3.2.5. Copy the curriculum records to the General Student module. If any of the curriculum records will be copied with a curriculum activity code of *INACTIVE* due to an overload situation, display the appropriate type of message based upon the error severity setting obtained from SOACTRL.
  - 3.2.6. Execute the backfill process for the learner record after the curriculum records have been inserted.
- 3.3. If there were no fatal or warning messages, display an informational message that the general student and curriculum records have been updated.
4. If the applicant does not have any registration records but does have a general student record with an effective term equal to the entry term on the application, then:
- 4.1. For each current and active curriculum on the application, if the **Application Preference** value is not null, calculate the priority for the learner curriculum records using the formula shown above.
  - 4.2. If the **Application Preference** value is null, copy the priority for the learner curriculum records from the priority values on the application's curriculum records.
  - 4.3. Compare the priority values on the new learner curriculum records to the priority values of existing curriculum records. For the application entry term, if a current and active learner curriculum record with a priority value that matches one of the priority values of a new curriculum record, then the following checks occur.
    - 4.3.1. If the error severity setting is *Fatal*, display an appropriate message, and exit the procedure.
    - 4.3.2. If the error severity setting is *Warning*, display a message giving the user the choice to cancel or continue.
    - 4.3.3. If the user chooses *Cancel*, exit the procedure.
    - 4.3.4. If the user chooses *Continue*, copy the existing learner curriculum record, giving it an activity status of *INACTIVE* and a curriculum status of *ADMITREPLACE*.

- 4.3.5. Validate the curriculum record, and display the appropriate type of message based upon the error severity settings obtained from SOACTRL. If the error severity is *Fatal*, exit the procedure.
  - 4.3.6. Copy the curriculum record to the General Student module. If any of the curriculum records will be copied with a curriculum activity code of *INACTIVE* due to an overload situation, display the appropriate type of message based upon the error severity setting obtained from SOACTRL.
  - 4.3.7. Execute the backfill process for the general student record after the curriculum records have been inserted.
- 4.4. If there were no fatal or warning messages, display an informational message that the general student and curriculum records have been updated.
5. If the applicant has a general student record with an effective term not equal to the entry term on the application, create a new general student record with an effective term equal to the entry term on the application, then:
- 5.1. For each current and active curriculum on the application, if the **Application Preference** value is not null, calculate the priority for the learner curriculum records using the formula shown above.
  - 5.2. If the **Application Preference** value is null, copy the priority for the learner curriculum records from the priority values on the application's curriculum records.
  - 5.3. Compare the priority values on the new learner curriculum records to the priority values of existing curriculum records. For the application entry term, if a current and active learner curriculum record with a priority value that matches one of the priority value of a new curriculum record, then the following checks occur.
    - 5.3.1. If the error severity setting is *Fatal*, display an appropriate message, and exit the procedure.
    - 5.3.2. If the error severity setting is *Warning*, display a message giving the user the choice to cancel or continue.
    - 5.3.3. If the user chooses *Cancel*, exit the procedure.
    - 5.3.4. If the user chooses *Continue*, copy the existing learner curriculum record, giving it an activity status of *INACTIVE* and a curriculum status of *ADMITREPLACE*.
    - 5.3.5. Validate the curriculum record and display the appropriate type of message based upon the error severity settings obtained from SOACTRL. If the error severity is *Fatal*, exit the procedure.

- 5.3.6. Copy the curriculum record to the General Student module. If any of the curriculum records will be copied with a curriculum activity code of *INACTIVE* due to an overload situation, display the appropriate type of message based upon the error severity setting obtained from SOACTRL.
- 5.3.7. Execute the backfill process for the general student record after the curriculum records have been inserted.
- 5.4. If there were no fatal or warning messages, display an informational message that the general student and curriculum records have been updated.

## Review Decision Rules

The Admissions Decision Criteria Report (SARDCSN) may be used to review the rules built on the Admission Decision Rules Form (SAADCSN). The Admissions Decision Calculation Process (SARBDSN) also uses the rules available on SAADCSN and defaults the **Level** field value from the Admissions Information to the General Student Information.

## Create Application

When a student applies to the institution, the Admissions Application Form (SAAADMS) is used to establish an admissions record. Before entering the admissions application, the applicant must first be entered into the system on the General Person Identification Form (SPAIDEN). An unlimited number of applications per term may be entered for any applicant. Any items the institution requires from the applicant may be entered and tracked on this form. User-defined rules for required items built on the Admissions Checklist Rules Form (SAACHKB) will automatically be entered on the application if the applicant matches those rules. Missing credential letters may be requested from the Communication information in the Application Fees window and generated using the Letter Generation Process.

You also have the option of rolling a recruit record forward to the Admissions module. To do this, select Prospect Information Summary (SRASUMI) from the Options Menu or perform a Duplicate Item function from the **Entry Term** field on Admissions Application Form (SAAADMS) to display the Prospect Summary Form (SRASUMI). You must decide which recruiting record you wish to create an application for, and place your cursor on that record. Next, you should perform a Select function to return the selected recruiting record to admissions. You may now modify the defaulted information or simply save it. If the defaulted recruiting record does not have a residency code and/or a student type code assigned to it, the system-required value of *O (Undeclared)* will default.

## Application Preference Number

You can enter an application preference value for the applications that are submitted by an individual, when multiple applications are created for a single entry term. This allows applicants to designate a hierarchical preference (i.e., ranking) among the applications they have submitted.

The application preference number is stored on SARADAP and entered on SAAADMS and in the Admissions module of Banner Student Self-Service. It is displayed on SAADCRV, SAADCBT, SAAACKL, SAARRAT, SAAQUAN, SAAEAPS, SAAETBL, and on the Web Application Summary in the Admissions module of Banner Student Self-Service. SAASUMI also displays the application preference number, as well as curriculum summary information.

SAAQUIK does not allow the entry of a value for the application preference number. This form is only intended to support the quick creation of a learner record. (Recruiting and admissions records can optionally be created as well.) It is not intended to be used as a way to perform maintenance on existing general student and/or curriculum records.

## Enter/Calculate Decision on Applicant

The Admissions Decision Form (SAADCRV) is used to enter decisions for an admissions application. This form also provides a mechanism for a decision to be calculated automatically by the system based on rules defined on the Admissions Decision Rules Form (SAADCSN). Once a decision is entered or calculated to indicate that the student has accepted and plans to attend, a general student record is automatically created using the information entered on the application. This record allows the student to be eligible to register. Decision letters may be requested from the Admission Decision Letter window and generated using the Letter Generation Process. When a decision is entered on SAADCRV which updates the student's application status, the status and decision codes will be updated upon entry to the Admissions Application Form (SAAADMS). A decision may also be calculated automatically using the Admissions Decision Calculation Report (SARBDSN).

## Multiple Applicant Acceptance Decisions

Learners can be accepted into an unlimited number of programs, even if they are currently registered for courses or have already been accepted into another program. The system updates the general student record when an applicant acceptance decision is rendered on a pending application after another approved application has already generated that record.

If application preference value for an application is null and an applicant acceptance decision is entered, the system copies the priority for the learner curriculum records from the priority values on the application's curriculum records. If the application preference value is not null and an applicant acceptance decision is entered, the system calculates the priority for the learner curriculum records using the following formula:

( Application Preference Number X 10 )+( Curriculum Priority Number )

SARADAP\_APPL\_PREFERENCE

SORLCUR\_PRIORITY\_NO from the application being processed

**Example:**

Joe Student has submitted two applications for a given term. His first preference application has a primary curriculum of BA-ARTS. His second preference application has a primary curriculum of BA-HISTORY. When his first preference application is accepted, the curriculum (BA-ARTS) is copied to the learner curriculum with a priority of 11. When his second preference application is accepted, the curriculum (BA-HISTORY) should be copied to the learner curriculum with a priority of 21.

The preceding was a simple example. However, there is the potential for much more complex situations to occur. As such, the system can assign the correct priorities to curricula as they are processed, based on the application preference, without regard to the order in which they are processed.

**Example:**

Joe Student submits a new application with a preference value of 2 and a primary curriculum of CE-ARTS. Assuming this application is accepted, CE-ARTS would become the new priority 2 learner curriculum, and BA-HISTORY would become inactive. In order for CE-ARTS to be added as another curriculum, rather than replace the BA-HISTORY curriculum, the application preference number or the priority on the admissions curriculum would have to be changed.

Learners can apply to a new program for a term in which they are already registered. Admissions applications are processed, even if the learner is registered for classes, as long as the existing primary curriculum record will not be changed or replaced.

**Example:**

Lisa Learner applied and was admitted to BA-ENGLISH for Fall 2006. A few months later, she attended orientation and pre-registered for classes. A month before the term was scheduled to begin, Lisa decided to apply for an additional program, BA-ANTHRO. Since Lisa's fees had not been assessed yet, her application for BA-ANTHRO was able to be processed, and the new program was added as a secondary curriculum.

When an applicant acceptance decision is made on a new application, the current and active learner curriculum records are kept active, and the newly accepted application's curriculum is added to the general student record (SGBSTDN) as another (secondary) priority, or, depending on the circumstances, to replace the existing primary curriculum with the new curriculum.

This is controlled by settings defined on the Curriculum Rules Control Form (SOACTRL). Three radio group fields in the main window work with the controls in the Number of Curricula Allowed window that define the number of curricula allowed per learner module. For instance, if a learner applies to and is accepted into a third curriculum, but only two current and active learner curricula are allowed, the new curriculum is copied to the learner module and will be assigned an *INACTIVE/OVERLOAD* status code.

The radio group fields on SOACTRL are in the Error Severity on Learner Curriculum Updates section of the main window and are as follows.

- The **Inactivate Current Curriculum in Same Term** radio group determines which type of error message, if any, to issue when an admissions decision will generate a learner curriculum that would inactivate an existing one with the same effective term. Valid values are *Fatal*, *Warning*, or *No Message*.
  - When the field is set to *Fatal*, the system will issue a fatal error message informing you that you cannot proceed without changing the application preference or curriculum priority on the application you are processing, because it will cause an existing learner curriculum to become inactive/non-current.
  - When the field is set to *Warning*, the system will issue a warning message informing you that the decision you are about to apply will cause an existing curriculum to become inactive/non-current. You have the option to continue or cancel.
    - Clicking on *Continue* will copy the existing curriculum record with a curriculum status of *ADMITREPLACE* and then insert the new curriculum record as well as the application decision record.
    - Clicking on *Cancel* allows you to perform a Clear Record on the application decision and adjust the application's preference value or the admissions curriculum priority as needed to avoid making changes to existing learner curricula.
  - When the field is set to *No Message*, the system will not issue any message at all when you enter a decision that will cause an existing curriculum to become inactive/non-current.
- The **Inactivate Current Curriculum in Previous Term** radio group determines which type of error message, if any, to issue when an admissions decision will generate a learner curriculum that would inactivate an existing one with an earlier effective term. Valid values are *Fatal*, *Warning*, or *No Message*.
  - When the field is set to *Fatal*, the system will issue a fatal error message informing you that you cannot proceed without changing the application preference or curriculum priority on the application you are processing, because it will cause an existing learner curriculum with an earlier effective term to become inactive/non-current.
  - When the field is set to *Warning*, the system will issue a warning message informing you that the decision you are about to apply will cause an existing

curriculum with an earlier effective term to become inactive/non-current. You have the option to continue or cancel.

- Clicking on *Continue* will copy the existing curriculum record with a curriculum status of *ADMITREPLACE* and then insert the new curriculum record as well as the application decision record.
  - Clicking on *Cancel* will allow you to perform a Clear Record on the application decision and adjust the application's preference value or the admissions curriculum priority as needed to avoid making changes to existing learner curricula.
- When the field is set to *No Message*, the system will not issue any message at all when you enter a decision that will cause an existing curriculum with an earlier effective term to become inactive/non-current.
- The **Cause a Curriculum Overload** radio group determines which type of error message, if any, to issue when an admissions decision will generate a learner curriculum with a curriculum status value of *OVERLOAD*, because the number of curricula or fields of study allowed has been exceeded.
    - When the field is set to *Fatal*, the system will issue a fatal error message informing you that you cannot proceed, because it would cause a learner curriculum or field of study record to be created with an *OVERLOAD* status. In order to process the application decision, you would need to inactivate the curriculum and/or field of study on the admissions application that would cause the overload.
    - When the field is set to *Warning*, the system will issue a warning message informing you that the decision you are about to apply will cause a learner curriculum or field of study record to be created with an *OVERLOAD* status. You have the option to continue or cancel.
      - Clicking on *Continue* will copy the admissions curriculum and/or field of study record(s) with a curriculum status of *OVERLOAD* to the General Student module and then insert the application decision record.
      - Clicking on *Cancel* will allow you to perform a Clear Record on the application decision and inactivate the admissions curriculum and/or field of study record(s) as needed to avoid causing a curriculum overload in the General Student module.
    - When the field is set to *No Message*, the system will not issue any message at all when you enter a decision that will cause a learner curriculum or field of study record to be created with an *OVERLOAD* status.

## Add/Maintain Test Scores

The Test Score Information Form (SOATEST) is used to add and maintain the test scores required for admission to the institution. Test scores for SAT, ACT, GMAT, GRE, and AMCAS tests may also be loaded into the system from test score tapes and are recorded

on this form. This information may be used in the automated decision process. The following optional fields may be used to further define test information: **Accommodation, Instrument, Form, and Purpose.**

This form performs the test score equivalent lookup when data is saved. The **Term** and the **Source** fields must both be entered in order for the equivalent lookup to take place. When a record is found on SOATEQU that matches the test code, test source, and test score entered on SOATEST, an equivalent record is created and entered in SOATEST. The new equivalent test score will be displayed upon requerying the data.

## Add/Maintain High School Data

The High School Information Form (SOAHSCH) is used to enter information about a person's high school career. The information includes high school code and name, transcript dates, graduation date, GPA, and subjects taken in high school. This information may be used in the automated decision process.

## Add/Maintain Prior College Data

The Prior College Form (SOAPCOL) is used to enter and maintain information about a person's prior college experience including degree information such as majors, minors, and areas of concentration, number of hours, GPA, and transcript date. The Prior College Summary Form (SOAPCOQ) may be used to view a summary of the prior college and degree information for a specific ID.

## Maintain Guardian Information

The Guardian Information Form (SOAFOLK) is used to enter address and employer information for a person's parents or guardians.

## Add Student Through Quick Entry

The Quick Entry Form (SAAQUIK) is an alternate method of entering a student as a person and creating a general student record without going through the General Person Identification Form (SPAIDEN), the Admissions Application Form (SAAADMS), and the Admissions Decision Form (SAADCRV). This form allows the necessary biographic, demographic, and admissions information to be entered all on one form. The option of creating a recruiting and/or admissions record when a student is added is also permitted. A person entered on this form automatically becomes a general student and is eligible to register.

In order to facilitate data entry on the Quick Entry Form (SAAQUIK), the Quick Entry Rules Form (SAAQKER) can be established with standard values that will default to the Quick Entry Form (SAAQUIK). The values that automatically default may be overridden on the SAAQUIK.

## Review Application Data

The Admissions Application Report (SARADMS) is used to review application data for a specified term.

The Admissions Count by College/Major Report (SARACTM) is used to produce a statistical count on admission applications with totals by major and college.

## Letter Generation—Letters, Paragraphs, and Variables

### Banner Student System Users

Two modules of the Banner Student System use the Letter Generation Process: Admissions and Recruiting.

### Recruiting Letters

Two Recruiting letters are supported; the *Application* for both letters is Recruiting.

Letter	Description
INF_REQ	Information Request Letter
INQUIRY_THANKS	Thank You Letter for all inquiry types

### Dynamic Parameters

For both of these letters, you must enter this dynamic parameter:

Dynamic Parameter	Description
&Recruiting_Term	Enter the recruiting term code for which this letter is being run.

### Note

For the INF\_REQ letter, you also need to specify Date 1 and Date 2 when you run the Letter Generation Print Report (GLRLETR). ■

### Paragraphs

You can use any of the following paragraphs in the Recruiting letters.

Paragraph	Description
NEWPAGE	New Page for Letter
HEADDTE	Letter Date

<b>Paragraph</b>	<b>Description</b>
GURPERS	Person Name/Address
INFOREQ	Information Request
CLOSING	Admissions/Recruiting Closing

### **Variables**

You can use any of the variables in the following list for the Recruiting letters.

<b>Variable</b>	<b>Description</b>
*ADDRESS_COUNTY	Address County Description
*APTB	Appointment Begin Time (in format HH:MM AM)
*APTD	Appointment Date (in format Month, dd, yyyy)
*APTE	Appointment End Time (in format HH:MM AM)
*APTI *	Appointment Interviewer Desc
*APTR	Appointment Recruiter Desc
*BDATE	Birthdate
*CITY	Address City
*CONT	Contact Description & Date
*CONTACT_DESCRIPTION *	Latest Contact Description
*CONTACT_MAX_SUBQUERY *	Subquery/Latest Contact Date
*DEPT +	Recruit Department Description
*FNAME	First Name
*GREETING_FIRST_NAME	Greeting with First Name
*GREETING_FORMAL	Formal Greeting
*HS_CITY	High School City
*HS_NAME	High School Name
*HS_NATN	High School Nation
*HS_STATE	High School State
*HS_STR1	High School Street 1
*HS_STR2	High School Street 2
*HS_STR3	High School Street 3
*HS_ZIP	High School ZIP Code
*ICITY	Institution City
*ID	Current ID
*INAME	Institution Name
*INATN	Institution Nation
*INTS	Recruit Outside Interest Desc
*IPHONE	Institution Telephone Number
*ISTAT	Institution State
*ISTR1	Institution Street Line 1
*ISTR2	Institution Street 2

<b>Variable</b>	<b>Description</b>
*ISTR3	Institution Street 3
*LATEST_CONT *	Latest Contact Description
*IZIPC	Institution ZIP Code
*LGNAME	Legal Name
*LNAME	Last Name
*MNAME	Middle Name
*NAME_PREFIX	Name Prefix
*NAME_SUFFIX	Name Suffix
*NATN	Nation Description
*PHONE	Telephone Number
*PNAME	Preferred Name
*RAPT	Appointment Contact Desc
*RCAMP +	Recruit Campus Description
*RCOLL +	Recruit College Description
*RDEGC +	Recruit Degree Description
*RECR +	Prospect Recruiter Description
*RLEVL +	Recruit Level Description
*RMAJR +	Recruit Major Description
*RSLT	Appointment Result
*RSTAT +	Recruit Status Description
*RSTUTYPE +	Recruit Student Type
*RTYPE +	Recruit Recruit Type Desc
*SBGI	Recruit Source Description
*SIGN	Letter Closing Signature
*SSN	SSN
*STATE	Address State Code
*STR1	Address Street Line 1
*STR2	Address Street Line 2
*STR3	Address Street Line 3
*TDATE	Today in Month dd, yyyy format
*TERM +	Recruit Term Description
*ZIPC	Address ZIP Code

## **Admissions Letters**

Three Admissions letters are supported; the *Application* for each letter is `Admissions`.

<b>Letter</b>	<b>Description</b>
ADM_APPL_ACKN	Admissions Application Acknowledgment
ACCEPT	Admissions Acceptance Letter
CHKL	Checklist Letters

## Dynamic Parameters

You must enter the appropriate dynamic parameters for each letter.

Letter	Dynamic Parameter	Description
ADM_APPL_ACKN	&Application_Term	Enter the term code for which this letter is being extracted.
ACCEPT	&Application_Term	Enter the term code for which this letter is being extracted.
ACCEPT	&Signature_Initials	Enter the code associated with the signature to be printed.
CHKL	&Application_Term	Enter the term code for which this letter is being extracted.
CHKL	&Signature_Initials	Enter the code associated with the signature to be printed.

### Note

You also need to specify Date 1 when you run the Letter Generation Print Report (GLRLETR). ■

## Paragraphs

You can use any of the following paragraphs in any of the Admissions letters.

Paragraph	Description
TB_RECR	Table for Recruiting Letter
NEWPAGE	New Page for Letter
HEADDTE	Letter Date
GURPERS	Person Name/Address
ACCEPT	Admissions Acceptance Paragraph
INADDRS	Institution Name and Address
FRMADDR	Formal Name, Address and Salutation
ADMACKL	Admissions Application Acknowledgment
CHKLBDY	Admissions Checklist
CHKLLST	List of Checklist Items
CLOSING	Admissions/Recruiting Closing
SIGN	Signature information

## Variables

You can use any of the variables in the following list for the Admissions letters.

Variable	Description
*ACOL1 +	Application College Desc
*ACAMP +	Application Campus Description
*ADEG1 +	Application Degree Desc
*ADEPT +	Application Dept Description
*ADMTYP +	Application Admit Type Desc
*ALEVL +	Application Level Description
*AMAJ1 +	Application Major 1 Desc
*AMAJ1_CONC +	Application Major 1 Conc Desc
*APPLNO +	Application Number
*APST +	Application Status Description
*APTB	Appointment Begin Time (in format HH:MM AM)
*APTD	Appointment Date (in format Month, dd, yyyy)
*APTE	Appointment End Time (in format HH:MM AM)
*APTI *	Appointment Interviewer Desc
*APTR	Appointment Recruiter Code
*ARECTYP +	Application Rec Type Desc
*ARESD +	Application Residency Desc
*ASRCE	Application Source Description
*BDATE	Birthdate
*CAMP +	Application Campus Description
*CHKL	Admissions Checklist Items
*CITY	Address City
*CONT	Contact Description & Date
*CONTACT_DESCRIPTION *	Latest Contact Description
*CONTACT_MAX_SUBQUERY *	Subquery/Latest Contact Date
*DCSN	Application Decisions & Dates
*FNAME	First Name
*GREETING_FIRST_NAME	Greeting with First Name
*ICITY	Institution City
*ID	Current ID
*INAME	Institution Name
*INATN	Institution Nation
*INTS	Outside Interest Description
*IPHONE	Institution Telephone Number
*ISTAT	Institution State
*ISTR1	Institution Street Line 1
*ISTR2	Institution Street 2

<b>Variable</b>	<b>Description</b>
*ISTR3	Institution Street 3
*IZIPC	Institution ZIP Code
*LGNAME	Legal Name
*LNAME	Last Name
*MNAME	Middle Name
*NAME_PREFIX	Name Prefix (Mr., Mrs., etc.)
*NAME_SUFFIX	Name Suffix (Jr., Sr., etc.)
*NATN	Nation Description
*PHONE	Telephone Number
*PNAME	Preferred Name
*RAPT	Appt Contact Description
*RSLT	Appointment Result
*SIGN	Letter Closing Signature
*SSN	SSN
*STATE	Address State Code
*STR1	Address Street Line 1
*STR2	Address Street Line 2
*STR3	Address Street Line 3
*STUTYP +	Application Student Type Desc
*TDATE	Today in Month dd, yyyy format
*TERM +	Application Term Desc
*ZIPC	Address ZIP Code

## Notes on Variables for Recruiting and Admissions

### + **Multiple Returns Possible**

Variables in Recruiting and Admissions use only the dynamic parameters &Recruiting\_Term and &Application\_Term to select prospect or application record information for a person. If your data maintenance and procedures allow multiple records for the selected term (for example, multiple applications for the same term for the same person), multiple variables *will* be returned.

Depending on the specific procedures at your institution, you will need to add additional dynamic parameters (or other criteria embedded in each variable) in order to return a single variable.

### \* **Subquery Variables**

Some variables require a subquery in order to return the desired result. For example, the variable \*CONT in both the ADMISSIONS and RECRUITING applications *will* return the contact description and contact date for all contacts with a person.

If you want to return the description of the most recent contact, you will need to use a subquery. The subquery would retrieve the maximum contact date, and the variable describing the contact description would use the subquery to return the correct (latest) contact description.

The variables `*CONTACT_MAX_SUBQUERY` and `*CONTACT_DESCRIPTION` are examples of variables using subqueries. `*CONTACT_MAX_DESCRIPTION` is the subquery, and `*CONTACT_DESCRIPTION` is the actual variable which will be used in a letter. Please note that the subquery in the actual variable must be placed on the last line of the variables rules.

## Additional Dynamic Parameters for Delivered Variables

Appointment variables include a number of additional dynamic parameters. These parameters are shown in the following list.

Dynamic Variable	Description
<code>&amp;From_Date</code>	Enter the beginning date of the date range in which the appointment may take place. Enter the date in DD-MON-YYYY format.
<code>&amp;To_Date</code>	Enter the ending date of the date range in which the appointment may take place. Enter the date in DD-MON-YYYY format.
<code>&amp;Appt_Contact_Type</code>	Enter the code associated with the appointment contact type to be printed.

## Build Curriculum Definition

Prior to creating the admissions application or entering data about a student curriculum, rules and error checking should be set up on the Curriculum Rules Control Form (SOACTRL), and rules should be built on the Curriculum Rules Form (SOACURR). SOACURR allows the institution's valid curriculums to be created based on the program, level, campus, college, and degree combinations. For detailed information on how to use curriculum rules, please refer to the curriculum procedure information in the *CAPP (Curriculum, Advising and Program Planning) Handbook*.

## Concurrent Curricula Processing

Concurrent curricula processing allows an institution to record and use multiple curricula for a person who is moved through the student cycle. This functionality is used by the Recruiting, Admissions, General Student, Registration, and Academic History modules.

Please refer to “Appendix C - Concurrent Curricula Processing” for detailed information on using concurrent curricula in Banner Student.

## Mass Entry Processing

Mass entry processing is used with Admissions, General Student, Registration, Academic History graduation, and athletic compliance processing. Mass entry forms are used to search on data, perform updates, and then display the results. Search and update criteria are user-defined and include student and curriculum elements where appropriate. The selected students can be reviewed and their updates processed immediately, or the updates can be held for later processing in job submission using a batch process. An audit form is used to view processing results for the mass entry forms.

Please refer to “Appendix D - Mass Entry Processing” for detailed information on using mass entry in Banner Student.

## Study Path Processing

Study path processing is used with the Admissions, General Student, Registration, and Academic History modules. Study paths provide a means by which a learner can associate specific course registration records to learner curriculum records during registration. The study path records allow the institution to track separate student status codes and academic standings (along with various other data) based on the student's curriculum. Likewise, a study path term enrollment record permits the tracking of enrollment eligibility that is separate from a student's overall enrollment status. The grade roll uses study paths to keep courses with an associated study path within the degree sequence created for that study path.

Please refer to “Appendix E - Study Path Processing” for detailed information on using study paths in Banner Student.

## Duplicating An Admissions Application

In the case that it is necessary to duplicate an application for admissions, this task can be accomplished by performing an Insert Record function and a Duplicate Record function on the Admissions Application Form (SAAADMS). This will be helpful in those instances where a student's term, level, student type, admission type, etc., are changed, but the majority of the student's information remains the same.

A new checklist will be created to ensure that any requirements for the new (duplicated) application are included. This occurs because the new application could be for a different level, college, major, etc., and the requirements could be very different. However, any existing requirements that have been satisfied (i.e., they have a received date) by the system (transcripts, test scores) for the original application will be included as satisfied in the new checklist. Manually updated checklist entries where checklist items were entered by the user are not carried forward to the new application.

# Admissions Application Set-Up Procedures for Banner Self-Service

## **Warning**

Due to data relationships and dependencies, these steps must be performed in the order specified. ■

### 1. Review General Web controls.

Set up the global Web rules using Customize Web Rules in Web Tailor. Set up the title, header, back URL and link, and help URL and link fields using Customize a Web Menu or Procedure in Web Tailor. If these rules, links, and fields have not been reviewed and customized for your institution, do this now.

The Address Role Privileges Form (GOAADRL) should contain entries with the **Role** field pulldown set to the value of *STUDENT* for all address types that are to be used by self-service admissions processing. These address types are displayed in the List of Values for the **Address Type** field in the Section Rules block of the Web Application Section Rules Form (SAAWAPP).

### 2. Define values on validation forms used in self-service admissions application processing.

**2.1.** Use the EDI Application Source Code Validation Form (STVAPLS) to define codes and descriptions for the possible sources of electronic applications.

**2.2.** Use the Application Verification Steps Validation Form (STVASTA) to define the manual steps that you want to perform for each electronic application. One value is required: ID Verification (*IDVR*).

For every electronic application received, you will need to determine whether the application was submitted by a person already known to Banner (for example, someone who is already being recruited) or whether the applicant does not yet exist in Banner. The ID Verification Step prevents the loading of an electronic application until you complete the verification and either match an electronic applicant to an existing Banner person or create the person in Banner.

You may also wish to define additional manual verification steps. The ID Verification Step is automatically completed by the Elec. App. Verify/Load Process (SARETMT) process. Any additional verification steps identified will *not* be automatically processed by SARETMT.

**2.3.** Use the Web Application Section Validation Form (STVWSCT) to define the sections of Banner Student Self-Service admissions applications. Data was delivered for this form, but you may wish to review the values, become familiar with the available sections, and/or update the descriptions of sections as these descriptions will display at the top of each section when the section is displayed on the Web.

- 2.4. Use the Web Application Elements Validation Form (STVWSCF) to define the data elements that can be used within a given section on the Web application. This form works in conjunction with the Web Application Section Rules Form (SAAWAPP) to allow customization of the Web application.

If an institution determines that a user-defined question can only be added to a specific section, then that section should be identified in the **Web Section** field. Otherwise, the **Web Section** field can be left blank, allowing questions to be added to any Web section. The data element descriptions can be modified here, and/or they can be modified on the Web Application Section Rules Form (SAAWAPP). Initial description values on SAAWAPP default from STVWSCF. The values on STVWSCF are delivered by SunGard® Higher Education.

 **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Required** checkbox on SAAWAPP for the *PERSONAL* (Personal Information) Web application section code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web application definitions and uncheck this checkbox for any applications for which it is currently checked. ■

- 2.5. Use the Application Type Code Validation Form (STVWAPP) to define the types of applications which can be received electronically and to define the values for several required data elements for each application type. Your institution may require different kinds of information from different types of applicants.

For example, you probably do not want to request prior college information from first-time applicants but certainly want to ask for this information from transfer applicants. You do want to ask for visa information from international applicants, but not from domestic applicants.

The STVWAPP form lets you define the types of applications which will be available to Web applicants. Think carefully about the kinds of information you request from applicants, and define appropriate application types for each. Make the descriptions of each type as clear as possible so that applicants are able to choose the correct application to complete. Applicants will see the descriptions from this form on the Web.

Several application types are delivered with the Banner Student Self-Service system:

- Default Example - All Sections (00)
- Undergraduate Freshman (W1)
- Undergraduate Transfer (W2)
- International Undergraduate Freshman (W3)

- International Undergraduate Transfer (W4)
- Graduate Studies (W5)
- International Graduate Studies (W6)
- Continuing Education, Non Degree (W7)

**2.6.** Use the EDI Rule Group Validation Form (STVEGRP) to display codes and descriptions for groups of EDI application processing rules. Group codes are provided so that rules which apply to similar types of data can be easily queried on the Electronic Admissions Application Rules Form (SAAERUL). The ADMS and DISP group codes are the two most used by self-service admissions processing.

 **Note**

Values in this table (STVEGRP) are not intended to be maintained locally. All required values are delivered by SunGard Higher Education and inserted during the install process and/or via update scripts. This form and its data are provided to support other forms, and no changes of any kind should be made to the data on this form. ■

**2.7.** Use the EDI Verification Label Validation Form (STVXLBL) to display codes and descriptions for EDI data verification labels which are used when processing a variety of incoming EDI data.

 **Note**

Values in STVXLBL are not intended to be maintained locally. All required values are delivered by SunGard Higher Education and inserted during the install process and/or via update scripts. This form and its data are provided to support other forms, and no changes of any kind should be made to the data on this form. ■

**3.** Set Web Display Indicators on validation forms.

Several admissions-related validation forms include Web Display Indicators. These indicators control whether a specific value in the validation form will display and/or be available for selection via the Web. Scripts which added the Web Indicator checkboxes set the values to unchecked (set to *N*) for all values on these forms. These checkboxes must be checked (set to *Y*) for a value to be available on the Web. When you Web-enable a value in one of these validation forms, you should also review the description. The description of a value, not the code itself, displays on the Web.

The following validation forms include Web Display Indicators which control admissions application processing via the Web:

*STVADMR - Admission Request Checklist Code Validation Form.* An applicant's outstanding checklist items display in the Review Application Status section of the Web when the checklist item is Web-enabled using the **Web Indicator** checkbox.

*STVAPST - Admission Application Status Code Validation Form.* Values display (when the **Web Indicator** checkbox is checked) when an applicant reviews their

applications via the Web. If the status of an existing application has not been Web-enabled, the description *Not Available* is displayed.

*STVAPDC - Admission Application Decision Code Validation Form.* If an application is entered into Banner (either manually or via the Web), the calendar on SAAWAAD is set up, and the **Display on Web** checkbox is checked on STVAPDC, then the most recent decision for that application will display on the Web Application Summary Page. If the decision code has not been Web-enabled, then the description *Please Contact Admissions Office* is displayed.

#### 4. Define user-defined questions.

The Web User Defined Questions Form (SAAWUDQ) is used to define institution-specific questions which request information not found elsewhere in any application section. You can use the form to develop questions to collect any additional kind of information your processing requires. Up to ten user-defined questions can be displayed on any application section, while up to twenty user-defined questions can be displayed in the Additional Information section. Each question can be up to 2,000 characters in length. The applicant will have 2,000 characters to answer the question.

This form also allows the user to associate an admission request checklist code with each question. In addition, the user can specify that a question should have a Yes/No radio button for its answer, instead of a text box.

In addition, essay questions can be defined on this form. Each essay question can be up to 2,000 characters in length. The Web applicant has 32,700 characters to answer the question.

#### 5. Build Banner Student Self-Service applications by combining sections.

In earlier steps, you reviewed and/or created Electronic Application Types (using STVWAPP) and reviewed delivered Web Application Sections (STVWSCT) and Web Application Elements (STVWSCF). Now it is time to combine the sections and elements to make an application. Sections include the actual questions that applicants will be asked to answer, and each application is composed of a set of sections in a specific order.

**5.1.** The Web Application Section Rules Form (SAAWAPP) is used to define the sections and elements that make up each application type. It is also used to specify the address type for each section of an application which collects address information. This form allows the user to determine in what order the sections will appear and in what order the data elements will appear within a section. Users can designate an element as required on this form, as well as indicate if the element should display on the Web. Users can also assign specific questions which were previously defined on SAAWUDQ to a Web section.

#### **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Required** checkbox on

SAAWAPP for the *PERSONAL* (Personal Information) Web application section code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web application definitions and uncheck this checkbox for any applications for which it is currently checked. ■

- 5.2. Use the Web Application Section - Data Element Rules window to enter the data elements that will display on a given section.

The first time you enter this window when defining a new section, all the data elements defined on STVWSCF for that Web section will populate the window. The user can then reorder the elements, as well as delete any not automatically marked as required. This window enforces the entry requirement of First and Last Name, Street Line 1, City, and Choice of Study before an application can be marked complete.

This window allows updates to the **Order**, **Element Rules Label**, **Question Sequence Number**, **Required (Indicator)**, and **Display (Indicator)** fields.

The Element Rules block is sorted by the **Order** field. When data elements initially populate the Element Rules block, their order is automatically set in increments of five (5). The user can update the **Order** field or delete an entire data element record.

- 5.3. The user can copy the sections and elements set up for another application type to a new application type by using the **Copy Configuration** button. If the application type being copied from has questions defined for it on SAAWUDQ, a copy of those questions will be made on SAAWUDQ for the new application type. If questions have already been defined on SAAWUDQ for the new application type, the copy process won't touch those questions but will add all questions with non-matching sequence numbers from the existing application type to the new application type.

For example:

A new application type of X1 has questions defined with sequence numbers 1, 2, and 5 on SAAWUDQ.

Questions with sequence numbers 1, 2, 3, 4, 5, 6, and 7 have already been defined for existing application type of Y1.

Use SAAWAPP to copy application type Y1 into X1. Questions 1, 2, and 5 for application type X1 will remain unchanged.

Questions 3, 4, 6, and 7 will be copied from application type Y1 to application type X1.

During the copy, any questions already assigned to application type X1 will also be assigned to application type Y1.

6. Establish dates for the creation and receipt of Banner Student Self-Service applications.
  - 6.1. Define calendars for the application types that have different schedules on the Web Application Term Calendar Rules Form (SAAWATR). Once this form is used for an application type, it must always be used. This form allows the institution to define the dates when applications of each type can be created and subsequently viewed on the Web.

This form works in conjunction with the Web Application Term Display Control Form (SOAATRM), where the calendar for all applications can be defined. If no rules exist on SAAWATR for an application type, then the rules defined on SOAATRM take effect.

- 6.2. Define the date ranges during which you will receive applications for a term. The Web Application Term Display Control Form (SOAATRM) is used to specify these time periods.
- 6.3. Control the calendar of applications in the Banner production tables using the Web Admissions Term Calendar Rules Form (SAAWAAD). This calendar determines by term, level, campus, college, and admit type when an application can be viewed (regardless of its source), when the status can be viewed, and when the most recent decision can be viewed on the Web.

The **Priority (Code)** field is used to create a unique key for each calendar rule. It may be necessary to have multiple records for one level and term that start and end on the same date, in order to exclude specific admit types from ever displaying on the Web. The **Priority (Code)** field can be used to make each record unique.

7. Customize Web pulldowns.
  - 7.1. Define codes, by application type, on the Web Application Customized Lists Form (SAAWADP) which should display in the Web pulldowns for test codes, requested materials, interests, and credit card waiver reasons. If no codes are defined here, the pulldown values will be taken from the appropriate Web-enabled rows on SOAXREF. If no codes are defined on SOAXREF, the values will be taken from the appropriate validation table.
  - 7.2. Identify curricula, by application type, on the Web Application Customized Curriculum Form (SAAWCUR) that you want to appear in the Plan pulldown.
  - 7.3. When you are first setting up self-service admissions, enter SAAWCUR with the **Restricted** checkbox in the Key Block unchecked. All appropriate curriculum rules will display. Check the **Restrict to Type** checkbox for those curriculum items which you want to be available for this application type. Upon

re-entering the form, if you want to see only those curricula for this application type, check the **Restricted** checkbox in the Key Block.

 **Note**

With the exception of the **Restrict to Type** checkbox on SAAWCUR, SAAWCUR and SOAXCUR are query only forms. SOACURR is used to customize Web application data. ■

**8.** Determine use of medical information question.

Determine whether you want to collect medical information on applications received via the Web. The data element, Medical, can be defined under the Personal Information section rule on SAAWAPP. This data element will display the Web-enabled values defined on SOAXREF (where the label is equal to STVMEDI). If no values are defined on SOAXREF, then the pulldown list will display all values in the Medical Code Validation Form (STVMEDI).

 **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Required** checkbox on SAAWAPP for the *PERSONAL* (Personal Information) Web application section code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web application definitions and uncheck this checkbox for any applications for which it is currently checked. ■

**9.** Customize Signature Page option.

**9.1.** A default Signature page is delivered with the Banner Student Self-Service Admissions application, and its display is controlled using the *SIGPAGEDISP* label rule on the Electronic Admissions Application Rules Form (SAAERUL) for the group of *DISP*. The Signature page allows you to provide processing instructions to applicants who submit applications via the Web.

**9.2.** The default Signature page is nothing more than Info Text for the page. Sample Info Text for this page is delivered, but you can customize it to reflect your institution's processing and desired instructions. Use the Format HTML Letter Rules Form (SOAELTR) to update the Information Text for the Display Signature package to reflect your institution's desired instructions, if you decide to have the Signature page displayed.

*The default page appears below. This page can be modified through Web Tailor.*

Your application has been marked complete. It will be reviewed by the Admissions Office when we receive your application fee of \$75.00. Please print this page, sign and date it, and send it with a check or money order to the following address:

SCT University  
4 Country View Rd  
Malvern, PA 19355

I certify that the information given in this application for admissions is complete and correct. I understand that the penalties for providing false information may include suspension or expulsion.

---

Name

Date

**9.3.** You can customize the Signature page by application type using the Electronic Applicant Web Default Rules Form (SAAWADF). The Web Signature Letters window is used to assign customized letters to specific letter types. The letter type of *STANDARD* is used to assign a Signature page for Web applicants not using Quick Start processing. The other letter types are used with Quick Start processing to identify which letter should be displayed, depending on the circumstances (i.e., a record is suspended during the automatic match).

The letters assigned to letter types must first be created on GTVLETR and then associated with the appropriate module code on the HTML Letter Rules Form (SOAELTL). Then the letter contents must be constructed on the Format HTML Letter Rules Form (SOAELTR).

SOAELTR allows you to create a letter using electronic applicant variables, some formatting, and free form text. This form also allows you to see how the letter will look by using the **Display Letter** button.

**10.** Customize Web application data.

Users can customize Web application data by application type using the Electronic Applicant Web Default Rules Form (SAAWADF). This form is used for entering default data and rules for curriculum, email address, link text, and credit cards.

The keys to the record are the Web application type and an effective term. The effective term code in the Default Curriculum block may be different than the effective term in the key. In order for a curriculum to be used on this form, it must first be set up on the Curriculum Rules Form (SOACURR).

If the term and curriculum are entered on this form, the curriculum data will automatically populate the student's application when the electronic application is created. The Web data section for curriculum does not have to be displayed on the Web application. If the section is displayed, the curriculum entered on SAAWADF will automatically be filled in.

The form can be used to define the email address and the email link text that will appear on the Application Checklist Menu on the Web. If no link text or email address exists on this form, but the *EMAILSENDADDR* and *EMAILSENDLINK* rules exist on SAAERUL where the value in the **Group** field is equal to *ADMS*, then that link text will display on the Application Checklist Menu and that email address will become the To: address.

The Application Credit Card Fee Rule block on SAAWADF is used to define the credit card processing rules. The institution indicates if they will accept credit cards, and if they do, the following decisions must be made. Are they required, will waivers be allowed, what detail code should be associated with the payment, and what, if any, checklist rule will be satisfied by the credit card payment. The **Charge Detail** and **Amount** are required fields, and the **Charge Detail** must have a category code of *APF*.

## 11. Build Quick Start processing.

Quick Start processing is turned on and off using the Automated Processing Rules block (in the Matching and Processing Rule window) on the Electronic Applicant Web Default Rules Form (SAAWADF). Check the **Enable QuickStart Processing** checkbox if you want Quick Start to run for this application type.

**11.1.** Once Quick Start processing is enabled, you can then customize how you want it to operate using the remaining fields in the Automated Processing Rules window. You can indicate that you want to:

- create a recruit record by checking the **Automatically Create Recruit Record** checkbox,
- create an application record by checking the **Automatically Create Application Record** checkbox, (if an application is created, you also have the option of creating a decision record by checking the **Process Decision** checkbox and entering the decision code in the **Admission Decision** field),
- access Banner Student Self-Service by checking the **Provide Access to Student Self-Service** checkbox, which in turn causes an **Access Web for Students** button to be displayed on the Signature page when the applicant has a student record, and
- create one application (if the **Create One Application** checkbox is checked, one application will be created with all curricula; if the field is not checked, a separate application will be created for each curriculum).

You can select any individual item or a combination of items. There are two restrictions to remember:

- the **Enable QuickStart Processing** checkbox must be checked in order to check any of the other choices, and
- the **Process Decision** checkbox must be checked in order for a decision code to be entered in the **Admission Decision** field. (In addition, the **Auto**

**Student** checkbox (in the EDI and Self-Service block of the Majors and Departments window on SOACURR) must be checked.)

For example, an institution could use Quick Start processing to automatically create a recruit record and an application record for a standard Web application, eliminating the need to run the Elec App Verify/Load Process (SARETMT).

- 11.2. Quick Start processing attempts to automatically match a Web applicant to an existing Banner person. Use the Web Matching Rules block on SAAWADF to set up the rules to be used by the automated matching process.

## 12. Review and update or define the Procedures and Routines for each application type.

Before loading data from the holding tables into the permanent Banner tables, you want to make sure that the information submitted by the applicant is as complete and correct as it can possibly be. Application Procedures and Routines perform much of this work.

A Procedure is a collection of Routines. Routines check data at the data element level, and a number of Routines may be included within a Procedure. Procedures are closely related to each table into which data will be loaded. All required Routines must be satisfied before a Procedure can be satisfied. A set of Procedures and Routines has been delivered and is attached to each of the delivered Application Types. Procedures and Routines are attached to each Electronic Application Type using the Electronic Admissions Procedure/Routine Control Form (SAAECRL). This form also includes several flags which specify how each procedure and routine will be used in electronic application processing.

Both the Procedures section of the main window and the Routines section of the Admissions Verification and Load Routines window include a **Required** flag and an **Override** flag.

- 12.1. The **Required** flag is used to specify the Procedures and Routines which will be attached to each electronic application when it is received. When a Procedure or Routine is attached to an application, it needs to be fulfilled before the application is considered verified and before the data is “pushed” to the permanent Banner tables. More specifically, each Routine needs to be fulfilled before the overall procedure can be satisfied.

The Procedures and Routines in effect control the types of data which will be verified and eventually “pushed” into Banner. You can set Procedures and Routines to “Not Required” if you do not wish certain data to be verified and/or loaded into Banner.

For example, you might choose not to load Medical Conditions from electronic applications. You would set the **Required** flag for Procedure P060 (Health Conditions Verification) to unchecked (*N*), and also set the **Required** flag for Routine R0080 (Create Medical Conditions) in Procedure P900 (“PUSH” Verification) to unchecked (*N*). This would tell the system not to verify Medical Conditions and not to push them into Banner.

- 12.2.** The **Override** flags associated with Procedures and Routines allow you to specify whether a Routine or Procedure can be overridden manually at the individual application level on SAAEAPS or automatically using the Elec. App. Verify/Load Process (SARETMT). If a Routine or Procedure is overrideable, it will still be attached to an electronic application (based upon the **Required** flag), but can be overridden if desired.

For example, you may normally collect required visa types from international applicants, but not all applicants may understand the visa type they require. You could require visa types from international applicants, but allow the “push” of visa information to be overridden if an applicant does not provide the correct information. In this case, you would set the **Required** flags for Procedure P032 (International Information Verification) and all of its Routines to checked (Y), but set the **Override** flag for Routine R0030 (Create International Record) in Procedure P900 (“PUSH” Verification) to checked (Y) so that you could override the push of this information.

If a procedure has the **Override** flag checked, that procedure will be automatically overridden, regardless of whether any of its routines fail.

If a routine has the **Override** flag checked, it will automatically be overridden if the corresponding data field is blank. The only time it will not be over-riden is if the incoming data is in error.

The Elec. App. Verify/Load Process (SARETMT) will automatically override a procedure or routine that fails the verification process due to blank data, if that procedure or routine is marked as able to be overridden on SAAECRL, and the *AUTOOVERRIDE* label for the group *VCRL* on SAAERUL is set to Y.

- 12.3.** Duplicate processing is governed by rules set up in two places. First, overall duplicate processing rules exist on the Electronic Admissions Application Rules Form (SAAERUL) under group *ADMS*. These rules are: *DUPLAPPLCURR*, *DUPLAPPLLEVL*, *DUPLAPPLMAJR*, *DUPLAPPLPERS*, *DUPLAPPLTERM*. These rules tell the self-service admissions push packages whether to check for duplicates in the given category. For example, if *DUPLAPPLPERS* is set to *N*, then the corresponding Web package will not check for duplicate persons for the Web application being pushed.

 **Note**

The *DUPLAPPLCURR* rule is not currently used in Self-Service admissions processing. ■

Duplicate processing rules also exist on the Electronic Admissions Procedure/Routine Control Form (SAAECRL). These rules allow for duplicate processing to be specified by application type instead of globally for all Web applications. The rules exist within procedure P050 Application Verification (R0060 - Duplicate Application for Person, R0070 - Duplicate Application for Term, and R0080 - Duplicate Application for Level) and procedure P120 Entry

Curriculum Verification (R0010 - Duplicate Application for Major). These routines are examined if the corresponding rule on SAAERUL is equal to *Y*.

Whether a specific routine allows duplicates depends on the setting of the **Override** flag. If the **Override** flag is unchecked, then duplicates are not allowed. If the **Override** flag is checked, then duplicates are allowed. For example, if *DUPLAPPLTERM* is set to *Y*, routine R0070 is marked as required, and the **Override** flag is checked, then multiple applications for the same term are allowed. However, if *DUPLAPPLLEVL* is set to *Y*, routine R0080 is marked as required, and the **Override** flag is *not* checked, then the Web application will not be pushed if one already exists in Banner for the same term and level.

For Web Application Types delivered by SunGard Higher Education, all appropriate procedures and routines have already been attached to each application type. If you define additional application types, you need to attach the appropriate procedures and routines to each new application type. You can do so automatically by using the **Copy Procedure** button in the Key Block of SAAECRL. The **Copy Procedure** button allows you to copy all the procedures and routines defined for any existing application type to your new application type.

#### Note

Please see the end of the Admissions Application Set-Up Procedures for Banner Student Self-Service section for a list of the procedures on SAAECRL and their associated routines. ■

### 13. Review and update rule values on the Electronic Admissions Application Rules Form (SAAERUL).

The Electronic Admissions Application Rules Form (SAAERUL) includes a number of rules which control how data is handled in self-service admissions application processing. All rules which are used by system processing have been delivered by SunGard Higher Education and should have been installed during the upgrade process.

For convenience purposes, Rules are categorized into Groups. Rule groups are used to display rules with a similar purpose together, and Group Codes can be used to specify that you want to display only a single group of rules at one time.

Each Rule is also identified by a Label and a Description. The script which installed the Rule Groups and Rules also installed either the specific value expected for a rule or the literal *UPDATE ME* in the **Value** field. When an actual value was delivered, its **EDI Indicator** was also checked (set to *Y*) indicating that the rule expects an EDI value, and the value for these rules should not be changed. When the literal *UPDATE ME* was delivered, the value must be updated to reflect the local option for EDI application processing to be used.

When reviewing and updating rules, you may want to query on the **Value** field for the value *UPDATE ME*. After updating the appropriate rows, you may want to review all rules so that you better understand how data will be processed.

 **Note**

Please see the end of the Admissions Application Set-Up Procedures for Banner Student Self-Service section for a list of the rules delivered, the group with which they are associated, a description of each rule, and instructions for updating each rule. ■

#### 14. Populate the EDI Cross-Reference Rules Form (SOAXREF).

If you will be processing both Web and EDI admissions applications, then you will need to refer to the sections on “Processing Self-Service Admissions Applications”, “EDI Set-up Procedures”, and “Processing EDI Applications” which follow. While much of the setup on SOAXREF may not be required for your self-service admissions applications, your EDI admissions application processing still relies heavily on the use of the EDI Cross-Reference Rules Form (SOAXREF).

SOAXREF is used mainly by Web application processing to customize which values the applicant will see in the various pull-downs available on the Web application. If an institution wants *all* values within a validation table to display in the Web pull-down, then *no* data from that validation table should be inserted into SOAXREF. For example, since most institutions would want all state and province codes to display in the state pull-down, no state or province codes need be inserted into SOAXREF. If, however, an institution would like to customize which values from a validation table will display in the Web pull-down, then they can either use the appropriate script to insert all values from the validation table and then check the **Web (Indicator)** for those values which should display, or they can manually insert only those values which should display on the Web (remembering to check the **Web (Indicator)**).

Data pertaining to which majors a Web applicant can select must be entered on SOAXREF as well as on SOACURR. The institution can also decide to default in a curriculum for a given application type. In that case, the major information will come from the Electronic Applicant Web Default Rules Form (SAAWADF). This form also uses the curricula defined on SOAXREF and SOACURR.

Following are the instructions for running the various scripts to populate SOAXREF for majors as well as for the other values which an institution may decide to load in order to customize which values will appear in the Web pull-downs.

Not all rows in SOAXREF are used in self-service admissions application processing. Many rows are used only to process incoming TS 189 transaction sets received through EDI. Other rows may be used only to process incoming AMCAS records for medical school applications. Regardless, only rows which are completely Web-enabled will be available for display in the self-service admissions application pull-down lists.

A Web-enabled row is one which:

- *exists* in SOAXREF.
- has an *EDI Value*, and perhaps, an *EDI Qualifier* (depending upon the type of data reflected in the rule).
- has the *Web (Indicator)* checked (set to *Y*).
- has a *description*.
- has a *Banner Value*.

In many cases, the only thing you need to do is ensure that all the values you want displayed on the Web exist on SOAXREF and that the description clearly represents the value you want the student to select. However, in some cases, you may need to build additional rules.

For example, the values delivered for the label *STVDEGC* (Degree Level - Degree Codes) are generic EDI Degree Levels (Associate, Baccalaureate, Master's). Web-enabled values for this label are displayed when a transfer applicant is asked about the degree pursued or earned at a prior college, and you may want to collect information about specific degrees (Associate of Technology, Bachelor of Arts, Master of Sciences), and have values in the corresponding Banner validation table which reflect these specific degrees.

In these cases, you need to make up a value for the **Value** field, and you should make sure that the value does not already exist for the label. For these rules, you will also set the **EDI Indicator** to unchecked (set to *N*).

## Define Web-enabled address and telephone types on SOAXREF

- Address and telephone types are assigned to each address section for a given application type on the Web Application Section Rules Form (SAAWAPP). In order for the Web to understand those values, they must be defined as Web-enabled rows on SOAXREF. Define the appropriate address types on SOAXREF using the label *STVATYP* and telephone types using the label *STVTELE*. Remember the Web-enabled rows must contain a Banner value.

## Define EDI cross-reference values for majors on SOAXREF

- Review the values in the **CIPC** field on the Major, Minor, Concentration Code Validation Form (STVMAJR).
- For US institutions, values used should be actual CIP (Classification of Instructional Program) codes. For institutions in other countries, a different code set (like Stats Canada codes) might be used. Determine the EDI code set used for this field; the valid choices are listed on SOAXREF for the label *FSTYIDQL*. Verify that the value for the rule label *DFLTMAJRQLFR* on the Electronic Admissions Application Rules Form (SAAERUL) for the group equal to *CURR*

contains the EDI qualifier for this code set. (If CIP codes are used in the **CIPC** field on *STVMAJR*, the EDI value for this label should be *81*.)

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefmajr.sql`. This script creates a row in the table *SORXREF* for each row in *STVMAJR* which has a value in the **CIPC** field.

#### **Note**

This script can be run whenever values are added to or changed on *STVMAJR*. It will always delete all values from *SOAXREF* (table *SORXREF*) and re-populate it with the current values from *STVMAJR*. ■

## Define multiple major codes on *SOAXREF*

In some cases, an institution wants to assign the same CIP code to multiple majors and then make multiple programs available for selection in the Planned Course of Study pulldown list in the Banner Student Self-Service Admissions Application.

To create *SORXREF* values for multiple major codes which use the same CIP code, perform the following manual steps:

- On *SOAXREF*, enter the label *STVMAJR* in the Key Information.
- Query for the first CIP code which may have multiple values.
  - Enter the CIP code in the **EDI Value** field and query on it.
- Review the values which exist, and/or add new values for the majors.
  - Enter *81* in the **EDI Qualifier** field. *81* is the major code qualifier for CIP codes.
  - Enter a value which is different than any existing CIP code. For example, for the first major code you define in a set, you might use the actual CIP code.
  - Enter the corresponding Banner major code for one of the majors represented by the CIP code.
  - For every other major code which uses the same CIP code, create one line on *SOAXREF*. On each line, you will need to enter a different EDI value in the **EDI Value** field. For example, you might merely put a letter at the end of the next CIP code. Specifically, Accounting (major code *ACCT*) might use an EDI value of *060201*, and Fund Accounting (major code *ACTF*) might use an EDI value of *060201A*.

For example:

EDI Label	EDI Qualifier	EDI Value	Student	Web	Banner Value	Description
STVMAJR	81	270101	X	X	MATH	Mathematics
STVMAJR	81	270101A	X	X	AMTH	Applied Mathematics

- Review entries in the Curriculum Rules Form (SOACURR) to ensure that you have an entry for each major. If you do not, create the entry, because cross-reference rules are dependent on curriculum rules.
- Define the EDI curriculum cross-reference values for the newly created major codes on SOACURR.
  - Query for the first major code.
  - Review the EDI cross-reference information for the record. You may need to define cross-reference values.
  - If you need to define cross-reference values, enter the appropriate EDI degree level code in the **EDI Degree** field. The appropriate EDI Qualifier and Identifier Code will display, or a List of Values will be available if more than one matching record exists on SOAXREF.
  - Check (set to *Y*) the **Display on Self-Service (Indicator)**.
  - Enter a Web display description in the **Self-Service Description** field. This is what will display in the Planned Course of Study pulldown menu on the Web application.
  - Save.
  - Repeat this step until you have appropriate cross-reference values defined for all major codes that you want to display on the Web application.
- Review your updates by accessing the Planned Course of Study page for a self-service admissions application. The programs you have just defined should display.

## Define EDI cross-reference values for states/provinces

- Update the **EDI Equivalent** on the State/Province Code Validation Form (STVSTAT) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefstat.sql`. This script creates a row in the table SORXREF for each row in STVSTAT which has an EDI Equivalent value.

 **Note**

This script can be run whenever states/provinces are added to or are changed on STVSTAT. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVSTAT. ■

## Define EDI cross-reference values for nations

- Update the **EDI Equivalent** on the Nation Code Validation Form (STVNATN) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefnatn.sql`. This script creates a row in the table SORXREF for each row in STVNATN which has an EDI Equivalent value.

 **Note**

This script can be run whenever nation codes are added to or are changed on STVNATN. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVNATN. ■

## Define EDI cross-reference values for ethnicities

- Update the **EDI Equivalent** on the Ethnic Code Validation Form (STVETHN) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefethn.sql`. This script creates a row in the table SORXREF for each row in STVETHN which has an EDI Equivalent value.

 **Note**

This script can be run whenever ethnic values are added to or changed on STVETHN. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVETHN. ■

 **Note**

Please see the end of the Admissions Application Set-Up Procedures for Banner Student Self-Service for a list of the labels used on SOAXREF. ■

**15.** Review curriculum rules and define EDI cross-reference curriculum rules.

In Banner, a student's academic program is defined by a combination of the data elements program, campus, college, level, degree, and major, and these data elements must be valid alone and in combination. When an applicant completes an application for admission, it is not likely that they would know all of the valid combinations of these elements.

To make Web program choice selection clearer and easier, use the Curriculum Rules Form (SOACURR). Before beginning Web application processing, you need to update the curriculum cross-reference rules with appropriate EDI values.

The Curriculum Rules Form (SOACURR) displays information for each major curriculum rule and the base rule to which it is attached. You need to update the **EDI Degree** field value. The **EDI Level** (qualifier) and **EDI Identification** values are retrieved by matching the major code from the curriculum rule to a row in SOAXREF. In addition, you need to update the **Web Display (Indicator)** and **Description** values for all curricula which are to be available for Web selection.

- The **EDI Degree** field must be updated to a valid value in the label *DEGRLEVL* (Degree Level Codes) from the EDI Cross-Reference Rules Form (SOAXREF). This field defines the generic level of the degree program for which the applicant is applying.
- The **EDI Level** (qualifier) field must be updated to a valid value in the label *FSTYIDQL* (Field of Study Qualifier Codes) from the EDI Cross-Reference Rules Form (SOAXREF). This field defines the EDI qualifier for the code set used for Field of Study Codes, which will be entered in the next field.
- The **EDI Identification** field must be updated to a valid value in the label *STVMAJR* (Field of Study Identifier Codes) from the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) for a rule using the EDI Field of Study Qualifier entered in the previous field. This field defines the subject matter of the intended field of study.
- The **Display on Self-Service (Indicator)** must be checked for all rules for which applications can be received via Banner self-service admissions application processing.
- The **Auto Student (Indicator)** must be checked if this curriculum is to be available for Quick Start processing.
- The **Self-Service Description** data must be provided for all rules representing curricula which will be displayed in self-service admissions applications. The description maintained is exactly what will be displayed on the Web and also represents the total information from which the student will be able to select. For example, if the curriculum rule represents a Bachelor of Arts degree with a major in English which is only valid on the Main Campus, you would want the description to be something like “BA - English (Main Campus only)”.

Some cautions are in order as you define your EDI Curriculum Cross-Reference Rules:

- If possible, you should *not* use the same combination of EDI degree level, EDI field of study qualifier, and EDI field of study identifier for more than one curriculum rule. If you do, Web processing will not be able to map the combination back to a single major curriculum rule. In this situation, the default values for the group code *CURR* (curriculum rules) maintained on the Electronic Admissions Application Rules Form (SAAERUL) are used when the application is loaded into the permanent Banner application tables.
- Web application types include a level in their definition on the Application Type Code Validation Form (STVWAPP), and curriculum rules require a level in each base rule on the Curriculum Rules Form (SOACURR). Only cross-referenced curriculum rules for the level which matches the Web application type level will be displayed on the Web. For example, if the level in a Web Application Type is *UG* (undergraduate), only cross-referenced curriculum rules for the level *UG* will display for that application type.

**16.** Customize curriculum rules by application type on the Web Application Customized Curriculum Form (SAAWCUR).

The Web Application Customized Curriculum Form (SAAWCUR) allows institutions to select only certain qualifying curricula to appear in the Plan pulldown for a particular application type. This form is query only, except for the use of the **Restrict to Type** checkbox.

When you enter the form with a valid application type in the Key Block, the form will return all SORCMJR records whose level matches the level for the application type and which have non-null values in SORCMJR\_DEGR\_CODE, SORCMJR\_EDI\_QLFR, and SORCMJR\_EDI\_VALUE. Once all valid records are displayed, you can choose which ones should be available for this application type by checking the **Restrict to Type** checkbox. A record must have the **Display on Self-Service (Indicator)** checked and the **Self-Service Description** field complete on SOACURR, in order for the record to display on the Web.

Once all appropriate rules for this application type have had the **Restrict to Type** checkbox checked, the user can re-enter the form with the application type and can check the **Restricted** checkbox in the Key Block. After performing a Next Block, the form will display only those curricula which have been restricted to this application type.

 **Note**

With the exception of the **Restrict to Type** checkbox on SAAWCUR, SAAWCUR and SOAXCUR are query only forms. SOACURR is used to customize Web application data. ■

Banner can be used to accept admissions applications via the Web using Banner Student Self-Service Admissions Application processing.

## Procedures Used in Self-Service Admissions Processing

The following table is a list of the procedures on SAAECRL that are delivered for the Web application type of *00*.

Procedure	Procedure Name	Required	Override	Description
P010	ID Verification	Y	N	The routines associated with this procedure verify whether a valid ID exists.
P020	Name Verification	Y	N	The routines associated with this procedure verify whether a valid name exists. A valid name in Banner must include a first name and a last name.
P030	Biographic Information	Y	Y	The routines associated with this procedure verify whether valid biographic information exists.
P032	International Information	Y	Y	The routines associated with this procedure verify whether valid international information exists.
P035	Residency Verification	Y	Y	The routines associated with this procedure verify whether valid residency information exists.
P040	Address Information	Y	N	The routines associated with this procedure verify whether a valid address exists.
P045	Email Verification	Y	Y	The routines associated with this procedure verify whether a valid email address exists.
P050	Application Verification	Y	N	The routines associated with this procedure verify whether a valid application exists.
P060	Health Conditions Verification	Y	Y	Not used unless Health Question section is implemented.
P070	Phone Record Verification	Y	Y	The routines associated with this procedure verify whether a valid phone record exists.
P080	Religion Verification	Y	Y	The routines associated with this procedure verify whether a valid religion exists.
P090	Language Record Verification	Y	Y	The routines associated with this procedure verify whether a valid language record exists.
P100	Immunization Record	Y	Y	Not used at this time.
P110	Applicant Activities	Y	Y	The routines associated with this procedure verify whether valid applicant activities exists.

Procedure	Procedure Name	Required	Override	Description
P120	Entry Curriculum Verification	Y	N	The routines associated with this procedure verify whether a valid entry curriculum exists.
P130	High School Verification	Y	Y	The routines associated with this procedure verify whether a valid high school exists.
P135	High School Subj. Verification	Y	Y	The routines associated with this procedure verify whether valid high school subjects exist.
P140	Previous College Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college exists. This procedure is not required if the application type will not collect this information i.e., the person is a freshman and has no prior college information.
P142	Prv. Col. Degree Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college degree exists.
P145	Prv. Col. Major Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college major exists.
P150	Test Score Verification	Y	Y	The routines associated with this procedure verify whether valid test scores exist.
P160	Relative Information Verification	Y	Y	The routines associated with this procedure verify whether valid parental information exists.
P170	Question Answer Verification	Y	Y	The routines associated with this procedure verify whether valid questions and answers exist.
P175	Requested Materials Verification	Y	Y	The routines associated with this procedure verify whether valid requested materials exist.
P200	Data Relationship Procedure	Y	Y	The routines associated with this procedure verify whether a valid data relationship procedure exists.
P900	"PUSH" Verification	Y	N	The routines associated with this procedure verify whether a valid PUSH exists.

## Routines Used in Self-Service Admissions Processing

The following table is a list of the routines on SAAECRL, organized by procedure.

Procedure	Routine	Routine Name	Required	Override
P010	R0010	Valid ID Found	Y	N
P010	R0020	ID Length Check	Y	N
P010	R0200	ID New to Banner; Create PrevID	Y	N
P010	R9001	Edit Results	Y	N
P020	R0010	First Name Check	Y	N
P020	R0020	Last Name Check	Y	N
P020	R0030	Previous Last Name Check	Y	Y
P020	R9001	Edit Results	Y	N
P030	R0010	Date of Birth Established	Y	Y
P030	R0020	Ethnicity Established	Y	Y
P030	R0025	Race Established	Y	Y
P030	R0030	Ethnic Category Established	Y	Y
P030	R0031	Veteran Established	Y	Y
P030	R0040	Legacy Established	Y	Y
P030	R0060	Marital Status Established	Y	Y
P030	R0080	Gender Established	Y	Y
P030	R0090	Citizenship Established	Y	Y
P030	R0091	Nation of Citizenship Est	Y	Y
P030	R0110	Native Language Established	Y	Y
P030	R0130	Home Language Established	Y	Y
P030	R0150	Corresponding Lang. Est	Y	Y
P030	R0200	Overwrite Existing Gender	Y	Y
P030	R0210	Overwrite Existing Birthdate	Y	Y

Procedure	Routine	Routine Name	Required	Override
P030	R0220	Overwrite Existing Citizenship	Y	Y
P030	R0230	Overwrite Existing Confidential	Y	Y
P030	R0240	Overwrite Existing Religion	Y	Y
P030	R0250	Overwrite Existing Marital St	Y	Y
P030	R0255	Overwrite Existing Race	Y	Y
P030	R0260	Overwrite Existing Ethnicity	Y	Y

## Rule Groups Used in Self-Service Admissions Processing

The following table is a list of the rule groups and codes on SAAERUL that are used by self-service admissions processing.

Group Code	Group Name	Description
ADDR	Address Source Rules	Rules in which you specify address source codes to be used in electronic admissions application processing.
ADMS	Admission Rules	Rules which control the loading of duplicate applications and residency information for applications.
ATYP	Address Type Rules	Rules used to specify the address types to be assigned to addresses received in electronic applications.
CQLF	Code Qualifiers	Rules used to specify the EDI code qualifier for types of data which require special processing.
CURR	Curriculum Rules	Rules used to translate received information into valid Banner curricula.
DCSN	Applicant Decision Rules	Rules used to allow admissions applicants to accept offers of admission in self-service.
DISP	Web Display Rules	Rules which control the display of data sections in the Banner self-service admissions application.
PATH	System Path Rules	Rules which describe the database path in which various system components have been installed.
PCOL	Prior College Rules	Rules which are used to process prior college information.
PQLF	Phone Qualifier Code Rules	Rules which contain certain EDI telephone type qualifiers.
TEST	Test Score Source Rules	Rules which are used to identify the source of a test.
VCRL	Verification Control Rules	Rules which control several of the verification procedures and routines.

## Delivered Rule Groups Used in Self-Service Admissions Processing

The following table is a list of the rules delivered, the group with which they are associated, a description of each rule, and instructions for updating each rule.

Group	Label	Description	EDI	Instructions
ADDR	DFLTADDRSRCE	Default Address Source	N	Update the Default Address Source to the value from the Address Source Validation Form (STVASRC) that you want assigned to addresses loaded from Web applications. (You may need to build the desired value on STVASRC first.) (See Note 2 below.)
ADMS	DFLTASRCWEB	Web Default Application Source	N	Update the Web Default Application Source to the value from the EDI Application Source Code Validation Form (STVAPLS) that you want assigned to electronic applications received via the Web.
ADMS	DFLTSBGIWEB	Web Default Application SBGI Source	N	Insert the source STVSBGI value into the Application Source Table (SARRSRC).
ADMS	DUPLAPPLCURR (Not currently used in Banner Student Self-Service admissions processing.)	Allow Dup App for Curriculum	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and curriculum. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLLEVEL	Allow Dup App for Level	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and level. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.

Group	Label	Description	EDI	Instructions
ADMS	DUPLAPPLMAJR	Allow Dup App for Major	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and major. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLPERS	Allow Dup App for Person	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same person, regardless of the term, level, curriculum, or major specified. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLTERM	Allow Dup App for Term	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term, regardless of the level, curriculum, or major specified. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	EMAILTYPE	Store default e-mails type	N	Enter a valid value from the E-mail Address Type Validation Form (GTVEMAL). This value will be used when storing email addresses from Web applications on GOAEMAL.
ADMS	EMAILSENDADDR	Admissions Email Address	N	Update the value to be the email address to which you want the Web applicant's email to be sent. For example: John.Doe@aol.com.

Group	Label	Description	EDI	Instructions
ADMS	EMAILSENDLINK	Admissions Email Link Text	N	Update the value to contain the hyperlink text the Web applicant will select in order to bring up their browser's mail system. For example: Have questions? Email us.
ADMS	FORRESIDCODE	Out of Country Residency Code	N	Update the Out of Country Residency Code to the value from the Residence Code Validation Form (STVRES D) that you want assigned to an application if the verification procedures determine that the person is an out-of-country resident. (See Note 1 below.)
ADMS	INRESIDCODE	In State/Prov Residency Code	N	Update the In State/Province Residency Code to the value from the Residence Code Validation Form (STVRES D) that you want assigned to an application if the verification procedures determine that the person is an in-state/province resident. (See Note 1 below.)
ADMS	ONEAPPORTWO	Create One Application or Two	N	Enter <i>ONE</i> to create one application with a primary and secondary curriculum, or enter <i>TWO</i> to create one application for each area of study. This value is checked when an application is loaded into Banner from the Web. If only one area of study is indicated on the Web, then only one application will be created, regardless of the value of this rule.
ADMS	OUTRESIDCODE	Out of State/Prov Residency Code	N	Update the Out of State/Province Residency Code to the value from the Residence Code Validation Form (STVRES D) that you want assigned to an application if the verification procedures determine that the person is an out-of-state/province resident. (See Note 1 below.)

**Note:** 1. Residency determination is made based on answers to a variety of questions. If the system cannot determine residency, or if no residency codes are specified in these three rules, the "Default" Residency Code, identified by the value for the label *DFLTRESDCODE* in the group *RES D* will be used.

Group	Label	Description	EDI	Instructions
ADMS	PINEXPIRE	Days QS PIN Expires in Secure	N	Enter the number of days in the <b>PIN Expiration Date</b> field on the Third Party Access Form (GOATPAC) for Quick Start access to Banner Student Self-Service. The default value of 0 days requires that the new student enter and confirm a new PIN. Values other than 0-9999 will be changed to 0 days.
ADMS	PRIMSRCEWEB	Web Default Application SBGI as Primary Source	N	Mark the value on the Application Source Table (SARRSRC) from <i>DFLT SBGIWEB</i> as the Primary Source.
ADMS	SSMIN	Minimum length of SSN on Web	N	Minimum length (9 digits) of the SSN that can be entered in Banner Student Self-Service. You can change the length in the <b>SSN/SIN/TIN Maximum Length</b> field on the Installation Controls Form (GUAINST).
ATYP	DFLTPARENTATYP	Default Parent Address Type	N	Update the Default Parent Address Type to the value from the Address Type Code Validation Form (STVATYP) that you want assigned to addresses created from parent address information. (See Note 2 below.)
ATYP	DFLTSTUDENTATYP	Default Student Address Type	N	Update the Default Student Address Type to the value from the Address Type Code Validation Form (STVATYP) that you want assigned to addresses created from applicant address information. (See Note 2 below.)

**Note:** 2. For Web applications, each application section in which address data can be reported has its own address type assigned to the application section using the Web Application Section Rules Form (SAAWAPP). Default address types defined under Rule Group *ATYP* are defaults which are used *only* when the address type to be assigned cannot be determined based upon other information.

Group	Label	Description	EDI	Instructions
CQLF	ACTVCQLFCODE	Default Activity Qlfr Code	Y	The Default Activity Qualifier Code is an EDI value, and it is delivered as <i>SA</i> . Specifically, it is used to distinguish between activities and awards which may be reported in the same EDI data segment. This value also has to be assigned to those values which are “student activities” in the EDI Cross-Reference Rules Form (SOAXREF) for rules with a label of <i>STVINTS</i> .
CQLF	AWRDCQLFCODE	Default Award Qualifier Code	Y	The Default Award Qualifier Code is an EDI value, and it is delivered as <i>SB</i> . Specifically, it is used to distinguish between activities and awards which may be reported in the same EDI data segment. This value also has to be assigned to those values which are “student awards” in the EDI Cross-Reference Rules Form (SOAXREF) for rules with a label of <i>STVINTS</i> .
CURR	DFLTCAMPCODE	Default Campus Code Value	N	Update the Default Campus Code Value to the value from the Campus Code Validation Form (STVCAMP) that you want assigned to an application if the application's campus cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTCOLLCODE	Default College Code Value	N	Update the Default College Code Value to the value from the College Code Validation Form (STVCOLL) that you want assigned to an application if the application's college cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).

Group	Label	Description	EDI	Instructions
CURR	DFLTDEGCCODE	Default Degree Code Value	N	Update the Default Degree Code Value to the value from the Degree Code Validation Form (STVDEGC) that you want assigned to an application if the application's degree cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTDEPTCODE	Default Department Code Value	N	Update the Default Department Code Value to the value from the Department Code Validation Form (STVDEPT) that you want assigned to an application if the application's department cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTMAJRCODE	Default Major Code Value	N	Update the Default Major Code Value to the value from the Major, Minor, Concentration Code Validation Form (STVMAJR) that you want assigned to an application if the application's major cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).

Group	Label	Description	EDI	Instructions
CURR	DFLTMAJRQLFR	Default Major Code Qualifier	Y	<p>The Default Major Code Qualifier is an EDI value, and it is delivered as <i>81</i>, for CIP code. Specifically, the Default Major Code Qualifier is used by the script <code>xrefmajr.sql</code> delivered to assist in building major code cross-reference values in the EDI Cross-Reference Rules Form (SOAXREF). This script copies each value in the Major, Minor, Concentration Code Validation Table (STVMAJR) which has a value in the <b>CIPC Code</b> field and creates a rule in the EDI Cross-Reference Rules Table using the major code, CIPC code, and EDI qualifier specified here.</p> <p>If the values entered in the <b>CIPC</b> field on STVMAJR are not Classification of Instructional Program (CIP) codes, the correct EDI value for the code set used for this field should be entered for this rule.</p> <p>(See Note 3 below.)</p>

**Note:** 3. The value for this rule is used *only* by the script used to populate major code values in SOAXREF. If you are not using the script and are instead building appropriate major code translation values by hand, this rule will not be used.

CURR	USEDEFAULTS	Use Default Curriculum Values	N	Update the value to checked(set to <i>Y</i> ) or unchecked(set to <i>N</i> ) to specify whether the campus, college, department, degree, and major defaults should be used when an application is created. (See Note 4 below.)
------	-------------	-------------------------------	---	--

Group	Label	Description	EDI	Instructions
-------	-------	-------------	-----	--------------

**Note:** 4. Default values are used when the appropriate value cannot be determined using data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR). For example:

A single set of EDI cross-reference values can be associated with more than one curriculum rule. If the same EDI cross-reference values are assigned to more than one curriculum rule, the defaults are used as “tie-breakers” and assigned to all associated fields.

Regardless of the data elements used when the Banner application is created, curriculum rule checking takes place according to normal rules when the application data is viewed on any Banner form. If the values loaded for the application represent an invalid curriculum choice, as defined by existing curriculum rules, an error message is displayed and corrective action may be required at that time.

DCSN	ALLOWDECISION	Allow Applicant Decision	N	Update the Value column from <i>UPDATE ME</i> to <i>Y</i> or <i>N</i> for the applicant decision.
DCSN	CONFIRMCODE	Attendance Confirmation Decision Code	N	Update the Value column from <i>UPDATE ME</i> to the value from the Admission Application Decision Code Validation Form (STVAPDC) which should be used for the confirm decision code.
DCSN	CONFIRMLABEL	Applicant Confirm Button Label	N	Update the Value column from <i>UPDATE ME</i> to any value which should be used for the Applicant Confirm label.
DCSN	WITHDRAWLABEL	Applicant Withdraw Button Label	N	Update the Value column from <i>UPDATE ME</i> to any value which should be used for the Applicant Withdraw label.
DCSN	WITHDRAWCODE	Withdraw Decision Code	N	Update the Value column from <i>UPDATE ME</i> to the value from the Admission Application Decision Code Validation Form (STVAPDC) which should be used for the withdraw decision code.
DCSN	CAPTUREWDINFO	Capture Withdrawn Information	N	Update the Value column from <i>UPDATE ME</i> to <i>Y</i> or <i>N</i> for the additional withdrawn information.

Group	Label	Description	EDI	Instructions
DISP	ACTVSDISP	# of Activity Rows to Display	N	The Number of Activity Rows to Display rule is used <i>only</i> in Banner self-service admissions application processing. It specifies the number of free-form activity spaces to display in the Activities Section of a Web application. If you do not want to display free-form activities, set this value to zero (0).
DISP	SIGPAGEDISP	Display Sig Page (TRUE/ FALSE)	N	The Display Signature page rule is used <i>only</i> in Banner self-service admissions application processing. The Banner Web Application includes the ability to display a signature, certification, and an instruction page at the time the applicant marks the application as complete. This rule specifies whether the signature page is displayed. (See Note 5 below.) This is true whether the page is created using Info Text or the Format HTML Letter Rules Form (SOAELTR).

**Note:** 5. The “Signature page” is a separate page which can be displayed after marking a Web application as “complete”. The page contains either Info Text if created using Web Tailor or an HTML letter if created using the Format HTML Letter Rules Form (SOAELTR). A sample set of InfoText is delivered for this page, but the text can be customized to suit local options using one of the Banner General Web Forms. For further information on updating Info Text, see the *Banner Web Tailor User Guide*.

DISP	TESTSDISP	# of Test Rows to Display	N	The Number of Test Rows to Display rule is used <i>only</i> in Banner self-service admissions application processing. It specifies the number of test report slots to display in the Tests Section of a Web application. If you do not wish to collect test scores via Web applications, do not associate the Test Information section with any Web application type on the Web Application Section Rules Form (SAAWAPP).
------	-----------	---------------------------	---	---

Group	Label	Description	EDI	Instructions
PATH	CHECKMARKPATH	Pathname for checkmark gif	N	The Checkmark gif pathname rule is the database pathname for the Checkmark gif. It is used <i>only</i> in self-service admissions application processing. <i>This location should be verified. Case is important.</i>
PCOL	PCOLDFLTDEGC	Prior College Default Degree	N	Update the Prior College Default Degree rule to the Banner degree code from the Degree Code Validation Form (STVDEGC) which should be assigned as the prior college degree attempted if an applicant does not supply a value.
PQLF	EMAILPQLFCODE	Phone Qualifier for E-mail	Y	<p>The Phone Qualifier for E-mail rule specifies the EDI standard telephone qualifier which identifies an e-mail address.</p> <p><b>Note:</b> The delivered value for this rule is <i>EM</i>; however, if the same value has been defined for another email address and/or telephone type (such as <i>Emergency</i>), then it is recommended that this value be changed.</p>
RESD	DFLTRESDCODE	Default Residency Code	N	Update the Default Residency Code rule to the code from the Residence Code Validation Form (STVRESD) which should be assigned to an applicant if a specific residence status cannot be determined based upon other information.
RESD	HEMOCOUNTY	Institution's Home County	N	Update the Institution's Home County rule to the code from the County Code Validation Form (STVCNTY) which represents the institution's home county. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.

Group	Label	Description	EDI	Instructions
RESD	HOMENATION	Institution's Home Country	N	Update the Institution's Home Nation rule to the code from the Nation Code Validation Form (STVNATN) which represents the institution's home nation. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.
RESD	HOMESTATPROV	Institution's Home State/Prov	N	Update the Institution's Home State/Province rule to the code from the State/Province Code Validation Form (STVSTAT) which represents the institution's home state. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.
TEST	DFLTTSRCWEB	Web Default Test Score Source	N	Update the Institution's Web Default Test Score Source rule to the code from the Admission Test Score Source Code Validation Form (STVTSRC) which represents the institution's test score source.
VCRL	AUTOOVERRIDE	Automatic Override Indicator	N	The Automatic Override Indicator rule is used to specify whether verification procedures and routines which allow overrides (as defined on the Electronic Admissions Procedure/Routine Control Form (SAAECRL) will be automatically overridden. Update this rule to checked(set to <i>Y</i> ) or unchecked(set to <i>N</i> ) depending upon your choice. Overriding a procedure or routine will not cause invalid data to be loaded; it merely reduces the number of manual overrides you may need to perform during electronic application verification.

## Cross-Reference Labels Used in Self-Service Admissions Processing

EDI cross-reference rules are identified by a Label. The label describes the purpose of the cross-reference rule. The following is a list of all the labels on SOAXREF that are used in self-service admissions processing.

 **Note**

You need to ensure that each label is set up on SOAXREF as identified in the accompanying text. If one or more labels are not set up as specified, self-service admissions processing will not work correctly. ■

Label	Description	Processing Notes
DEGRLEVL	Degree Level Codes	Degree Level Codes are used to describe the generic level of a degree, and the EDI values delivered roughly correspond to the values in the Degree Award Category Code Validation Form (STVACAT). These values are used only when defining the EDI Curriculum Cross-Reference Rules. Update the Banner value to the corresponding value from STVACAT. (The Banner value will normally be the EDI value <i>without</i> the period.) Do not check (set to Y) the <b>Web (Indicator)</b> on SOAXREF, as these values are not used to control Web pulldown lists, but only to define valid cross-reference values for building curriculum cross-reference rules.
FSTYIDQL	Field of Study Qualifier Codes	Field of Study Qualifier Codes are used only to specify the code set which is used to describe field of study choices. No action is required on any of these rules for Web processing. However, one of these values will be associated with the rules for label <i>STVMAJR</i> where it will identify the code set used to define valid major code choices.
GENDER	Gender Codes	Gender Codes are used to define the Banner equivalent for EDI gender values. Three values are delivered. No action is required on any of these rules for Web processing.
STVCITZ	Citizenship Type Codes	Values in the Citizenship Type Code label are used to customize the citizenship types which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to Y) and enter the appropriate Banner value from STVCITZ. If all values from STVCITZ should be displayed, then none need be entered here.

Label	Description	Processing Notes
STVDEGC	Degree Level-Degree Code	For Web application processing, you can identify specific degree codes to be available for Web selection. In this case, you default values in the EDI value column which do not represent EDI Degree Level Codes, set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ), and enter the appropriate Banner value for the specific degree codes to be made available. If all degree codes from STVDEGC should be available for Web selection, none need be entered here.
STVETHN	Ethnic Codes	Values in the Ethnic Code label are used to specify the ethnicities which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value. If you have Banner ethnic codes which do not correspond to EDI ethnic codes and you want to make these additional codes available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. (See Note below.) If all ethnic codes from STVETHN should be available for Web selection, none need be entered here.
<p><b>Note:</b> The script <code>xrefethn.sql</code> is used to populate the <i>STVETHN</i> label rows with values from the Ethnic Code Validation Form (STVETHN).</p>		
STVINTS	Award and Activity Codes	Values in the Award and Activity Codes label are used to specify the interests which will be available for Web selection. For each value which should be Web-enabled, specify the appropriate EDI qualifier which represents “activities” (this value is <i>SA</i> and is also entered on SAAERUL to identify student activities), set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVINTS. If you have Banner interest codes which do not correspond to EDI codes, and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. (See Note below.) If all award and activity codes from STVINTS should be available for Web selection, none need be entered here. If the awards and activities should be specific to an application type, use the Web Application Customized Lists Form (SAAWADP).

Label	Description	Processing Notes
	<p><b>Note:</b> For rules which represent student awards, set the EDI Qualifier to <i>SB</i>. Awards can also be reported through the Web, but whether reported through a Web application or a TS 189 transaction set, these values will not be loaded into the permanent Banner application tables.</p>	
STVLANGN	Language Name Codes	<p>Values in the Language Name Codes label are used to specify the languages which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i>) and enter the appropriate Banner value from STVLANG. If you have Banner language codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i>) for these rules. If all language codes from STVLANG should be available for Web selection, none need be entered here.</p>
STVMAJR	Major Codes	<p>Values in the Major Codes label are used to translate EDI field of study data into Banner major codes. Field of Study data reported in TS 189 transaction sets includes a qualifier code and value. Qualifier codes represent different standard code sets, like Classification of Instructional Program (CIP) codes or Stats Canada codes. You use a combination of a Degree Level code (label <i>DEGRLEVL</i>), Code Set Qualifier, and Banner code to define the cross-reference from EDI values to Banner values on the Curriculum Rules Form (SOACURR). To create rules for the <i>STVMAJR</i> label, enter the Qualifier which represents a valid EDI field of study code set, a value from the indicated set, and the Banner equivalent for the EDI value. (See Note below.)</p>
STVMATL	Requested Materials Codes	<p>Values in the requested materials label are used to specify the requested materials which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i>) and enter the appropriate Banner value from STVMATL. If all requested materials codes from STVMATL should be available for Web selection, none need be entered here. If the requested materials should be specific to an application type, use the Web Application Customized Lists Form (SAAWADP).</p>

**Note:** The script `xrefmajr.sql` is used to populate the STVMAJR label rows with values from the Major, Minor, Concentration Code Validation Form.

Label	Description	Processing Notes
STVMEDI	Medical Condition Codes	Values in the Medical Conditions Codes label are used to specify the conditions which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVMEDI. If you have Banner medical codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. (See Note below.) If all medical condition codes from STVMEDI should be available for Web selection, none need be entered here.

**Note:** Use the medical condition data element on the Web Application Section Rules Form (SAAWAPP) to include this data in the Web application.

STVMRTL	Marital Status Codes	Values in the Marital Status Codes label are used to specify the marital statuses which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVMRTL. If you have Banner marital status codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. If all marital status codes from STVMRTL should be available for Web selection, none need be entered here.
---------	----------------------	---

STVNATN	EDI Nation Codes	Values in the Nation Codes label are used to specify the nation codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVNATN. If you have Banner nation codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. (See Note below.) If all nation codes from STVNATN should be available for Web selection, none need be entered here.
---------	------------------	---

**Note:** The script `xrefnath.sql` is used to populate the STVNATN label rows with values from the Nation Code Validation Form.

Label	Description	Processing Notes
STVRELG	Religion Codes	Values in the Religion Codes label are used to specify the religion codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVRELG. If you have Banner religion codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. If all religion codes from STVRELG should be available for Web selection, none need be entered here.
STVRELT	Relationship Codes	Values in the Relationship Codes label are used to specify the relationship codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVRELT. If you have Banner relationship codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules, using an EDI value which is not already in the EDI set and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. If all relationship codes from STVRELT should be available for Web selection, none need be entered here.
STVSTAT	EDI State Codes	Values in the State Codes label are used to specify the state/province codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVSTAT. (See Note below.) If all state codes from STVSTAT should be available for Web selection, none need be entered here.

**Note:** The script `xrefstat.sql` is used to populate the *STVSTAT* label rows with values from the State/Province Code Validation Form (STVSTAT).

Label	Description	Processing Notes
STVTESC	Sub-Test Codes	<p>Values in the Sub-Test Codes label are used to specify the sub-test codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i>) and enter the appropriate Banner value from STVTESC. If you have Banner test types codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules. Use an EDI value which is not already in the EDI set, and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i>) for these rules. An EDI Qualifier, EDI Value, Description, and Banner Value are all required for <i>STVTESC</i> rules. If all test codes from STVTESC should be available for Web selection, none need be entered here. If the test types should be specific to an application type, use the Web Application Customized Lists Form (SAAWADP).</p>

Label	Description	Processing Notes
STVVTYP	VISA Type Codes	Values in the Visa Type Codes label are used to specify the visa codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVVTYP. If you have Banner visa type codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules. Use an EDI value which is not already in the EDI set, and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. If all visa type codes from STVVTYP should be available for Web selection, none need be entered here.
STVWAIV	Application Waiver Codes	Values in the Application Waiver Codes label are used to specify the application waiver codes which will be available for Web selection. For each value which should be Web-enabled, set its <b>Web (Indicator)</b> to checked (set to <i>Y</i> ) and enter the appropriate Banner value from STVWAIV. If you have Banner application waiver codes which do not correspond to EDI codes and you want to make these additional types available for Web usage, create new rules. Use an EDI value which is not already in the EDI set, and set the <b>(EDI) Standard (Indicator)</b> to unchecked (set to <i>N</i> ) for these rules. An EDI Qualifier, EDI Value, Description, and Banner Value are all required for STVWAIV rules. If all application waiver codes from STVWAIV should be available for Web selection, none need be entered here. If the application waiver codes should be specific to an application type, use the Web Application Customized Lists Form (SAAWADP).

## Address Hierarchy Rules for Credit Card Payment

Rules with an internal code of *WEBCADDR* and an internal group code of *ADDRESS* are used with miscellaneous transactions to set up the address hierarchy for Web payment card payments and to populate the address in the *GORCCA* table.

Miscellaneous transactions are used for admissions application fees. When an applicant pays an application fee that creates a miscellaneous account transaction and uses a payment card for payment, an address is needed to process the transaction. If no *SARADDR* record exists, and no current *SPRADDR* record exists, the applicant is taken to a page in Self-Service to enter the address information.

Miscellaneous transactions are also used for transcript request fees and enrollment verification fees. When a student pays a fee that creates a miscellaneous account

transaction and uses a payment card for payment, an address is needed to process the transaction. If no current SPRADDR record exists, the student is taken to a page in Self-Service to enter the address information.

Miscellaneous transactions are not used for registration fees or graduation application fees. A student does not need an address record to process payment for those fees.

## Identify Payment Profile for Credit Card Payment

Payment profiles are configured on GOAMERC. You can query on GTVSDAX for the *WEBSTUCCID* internal group code with an internal code of *LEVEL*, *COLLEGE*, or *CAMPUS* to match the student's level, college, or campus. The external code value for the rule is the payment profile.

## Processing Self-Service Admissions Applications

Before you receive your first Web application, you need to establish appropriate policies and procedures for processing Web applications. For example, you need to determine whether to weed out frivolous applications, when and how you will collect application fees (if required), whether you require and how you will collect application certifications and signatures, and what impact Web applications will have on application and yield statistics.

The Elec. App. Verify/Load Process (SARETMT) is a batch process that is used to match, verify, and load admissions applications received via the Web. This process allows users to match, verify, and load large numbers of Web applications at one time. The process uses the same matching algorithm as the Electronic Prospect Match Process (SRRSRIN) and the Common Matching Entry Form (GOAMTCH). The Electronic Application Process Form (SAAEAPS) is used to process Web applications that are placed in suspense or error status by the SARETMT batch load process. In addition, SAAEAPS can be used to review Web applications and delete those that are most likely frivolous (i.e., applications from Mickey Mouse or Claude Monet).

### Overall Process

The overall process for receiving self-service admissions applications is as follows.

1. The applicant creates and completes the Web application.
2. The institution reviews all Web applications (via SAAEAPS) added on a specific date that are complete to check for frivolous applications. (Optional)
3. The institution runs the SARETMT process to match, verify, and load Web applications.

4. The institution reviews Web applications on SAAEAPS that were put into Suspend or Error status by the SARETMT process.
5. Suspended error records are resolved on SAAEAPS using GOAMTCH to determine if the applicant is New or is a Match to an existing Banner record.
6. The institution reruns SARETMT to verify and load those applications whose status has just been resolved. Depending on the number of suspended and error records, the institution can choose to manually verify and load these Web applications on SAAEAPS.

## Detailed Steps

The detailed steps for receiving self-service admissions applications are discussed in this section.

1. Use the Electronic Application Process Form (SAAEAPS) to display received Web applications.

To display the application(s) for a specific person, enter the electronic ID for that person in the Key Block or use a List function to display the Electronic Applicant Search Form (SOAEIDN), where you can search for an electronic applicant using name and ID.

You can also select only those applications added on a certain date by entering the **Add Date** in the Key Block field. Only applications matching the **Web ID** and/or **Add Date** in the Key Block will be displayed.

You can also enter the main block and query on certain fields. Those fields are: **Application Number, Application Type, Completion Indicator, Term, Source (with a value of WEB), Add Date, Accepted Indicator, Process, Process Date, Person Status, and Application Status.**

If you find applications that you believe are frivolous, they can be deleted using the Delete Record function. Once an application is deleted on SAAEAPS, its associated data is also deleted from the electronic application holding tables; therefore, the application will no longer be viewable on SAAETBL.

2. Use the Elec. Appl. Verify/Load Process (SARETMT) to match, verify, and load the Web applications that meet your processing guidelines.

Parameters for SARETMT allow processing based upon Application Type, Application Source, Application Term, and the Date Range of when applications were added.

### 2.1. Run SARETMT in audit mode.

SARETMT can be run in audit mode providing the user with the opportunity to review the match, verify, and load status of each application before it is actually

processed. The Status field will indicate whether the Web application is New, Matched, Suspended, or in Error based on the matching rules specified by the matching source code assigned to the interface code on STVINFC. If a Web application type has previously been pushed for a given Web ID, the Status field will indicate *N/A*, as a matching PIDM already existed for the Web ID. The process will indicate if verification errors occurred or if the application was pushed.

## 2.2. Run SARETMT in update mode.

The user can run the match, verify, and load process in update mode. All electronic applications matching the input parameters will be processed by SARETMT.

Three possible outcomes can exist for each record processed by SARETMT.

- The record was matched, verified, and pushed successfully resulting in the creation of a SAAADMS application record.
  - The record was placed into suspense or error status during the match process. Suspended and error records will not be processed further by SARETMT until the match status has been resolved to either New or Matched. The user can resolve the suspended status using the Electronic Application Process Form (SAAEAPS) (See the “Resolve Suspended Electronic Applications” section below for details.)
  - The record failed the verification process. Numerous verification routines exist to ensure the integrity of the data being loaded into Banner. If certain errors occur during the verification process, the record will be marked with a verification error.
3. Resolve suspended and error electronic applications using the Electronic Application Process Form (SAAEAPS).
    - 3.1. Access the Electronic Application Process Form (SAAEAPS).
    - 3.2. Navigate to the main block and query for the appropriate records (i.e., term, source equals Web etc.) having a Person Status of *S* or *E*. These are the records that will need to be resolved before they can be verified and pushed into Banner.
  4. Select the Verification Steps tab or the Manual Verification Steps option from the Options Menu to access the Verification Steps window.
  5. Mark any of the person or application steps complete, except for the ID Verification (*IDVR*) step, and then save the changes.
  6. Select the ID Verification (*IDVR*) step, and then choose the Associate Person with ID item from the Options Menu.

7. This opens the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record from the **Select an ID** field.
  - **Electronic ID** – This is the ID used to create the electronic application.
  - **Local ID** – This is used for applications filed via EDI where the applicant provided a Local ID.
  - **SSN** – This is the SSN or other Federal ID number specified on the electronic application.
  - **Banner ID** – This is used if you wish to enter an explicit ID to be used by Banner.
  - **Generate ID** – This indicates that Banner should generate an ID for this person.
8. After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display GOAMTCH.
9. The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.

10. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
11. Once the data has been “cleaned up”, use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
12. The incoming electronic application can be a match, a potential match, or a new record:
  - 12.1. If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - 12.2. If the incoming electronic application is found to be a potential match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - 12.3. If the electronic application is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.

13. If the person is found to be an exact match, you can do one of three things:
  - 13.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 13.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.
  - 13.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
14. After selecting one of the options above, the user will be returned to the Verification Steps window, and the ID Verification (*IDVR*) step will be marked as complete. Continue processing the electronic applicant as needed.
15. Resolve verification errors using the Electronic Application Process Form (SAAEAPS).

If the *AUTOOVERRIDE* label on the Electronic Admissions Application Rules Form (SAAERUL) for the group *VCRL* is set to *Y*, and the procedures and routines are marked as overrideable on SAAECRL, then SARETMT will not stop the process if verification errors occur (unless they are data errors). If the *AUTOOVERRIDE* label is set to *N*, then any verification errors found while SARETMT is processing will be identified on the report file. These errors can be viewed on SAAEAPS and must be resolved before the affected applications can be re-processed by SARETMT. Verification errors can only be resolved on SAAEAPS if the routine and/or procedure causing the error have the **Override (Indicator)** checked on SAAECRL for the appropriate application type.

- 15.1. Access the Electronic Application Process Form (SAAEAPS).
- 15.2. Navigate to the main block and query for the appropriate records (i.e., term, source, etc.) having a **Process** field value of *E*. These are the records that will need their verification errors resolved before they can be pushed into Banner.
- 15.3. Select Review Results from the Options Menu or use Next Block to access the Verification/Load Results window.

In the System Verification Procedure block, each procedure is displayed, one procedure at a time. At the same time, each routine associated with a procedure is displayed in the System Verification Routines block.

- 15.4. Scroll through each procedure to find the procedures that have not been verified (i.e., the **Completion Indicator** checkbox is *not* checked). To resolve a procedure or routine, check the appropriate override (**Override Indicator**) box. If you override an individual routine, only the verification associated with that routine will be bypassed. If an entire procedure is overridden, none of the individual routines will have verification performed.

**15.5.** Once all routines and/or procedures are overridden, return to the main block of SAAEAPS. You can manually re-verify the application here by selecting Verify Application from the Options Menu, or you can re-run SARETMT.

**16.** Re-run SARETMT in update mode.

SARETMT will try to verify all records that were previously suspended and will attempt to re-verify all applications that originally failed verification. All applications that pass the match and verification processing will be pushed to Banner. Once an application has been pushed, the **Process** field will be set to *P(ushed)*.

## Manually Matching, Verifying, and Pushing Electronic Applications

The following steps show how to manually match, verify, and push electronic applications into Banner using SAAEAPS.

**1.** Use the Electronic Application Process Form (SAAEAPS) to display received Web applications.

To display the application(s) for a specific person, enter the electronic ID for that person in the Key Block or use a List function to display the Electronic Applicant Search Form (SOAEIDN), where you can search for an electronic applicant using name and ID.

You can also select only those applications added on a certain date by entering the **Add Date** in the Key Block field. Only applications matching the **Web ID** and/or **Add Date** in the Key Block will be displayed.

You can also enter the main block and query on certain fields. Those fields are: **Application Number, Application Type, Completion Indicator, Term, Source (with a value of WEB), Add Date, Accepted Indicator, Process, Process Date, Person Status, and Application Status.**

If you find applications that you believe are frivolous, they can be deleted using the Delete Record function. Once an application is deleted on SAAEAPS, its associated data is also deleted from the electronic application holding tables; therefore, the application will no longer be viewable on SAAETBL.

**2.** Flag applications for further processing.

If you will not process an application until a fee or certification is received, you might also want to set the **Accepted Indicator** to *N* until you receive the appropriate additional information required by your policies and procedures.

For those applications which you will further process, set this indicator to *Y*.

3. Perform any required manual verification steps.

Select the Verification Steps tab, use a Duplicate Item function, or select Manual Verification Steps from the Options Menu to transfer to the Verification Steps window. There may be two kinds of manual verification steps, those related to person data and those related to an application. You defined the manual verification steps which would be required on the Application Verification Steps Validation Form (STVASTA). One person-related step - ID Verification (*IDVR*) - is required by system processing and will be present whether or not you defined additional verification steps.

If the application was received via the student (secured) side of the Web (**Record Type** is *S*), you do *not* need to complete the ID Verification (*IDVR*) step. It will be completed for you when you verify the application's data. Go to Step 11.

If the application was received via the non-secured side of the Web, you must either match the applicant to an existing Banner person or create the person in Banner. Either of these functions also completes the ID Verification (*IDVR*) step. Continue with Step 3 through Step 10.

When you are positioned on the ID Verification (*IDVR*) step record, use a function key to perform special processing. The function can be performed if the ID Verification (*IDVR*) step has already been completed.

Use a Count Query Hits function or select Associate Person with ID from the Options Menu to transfer to the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record in the **Select an ID** field.

- **Electronic ID** – This is the ID used to create the electronic application.
- **Local ID** – Used for applications filed via EDI where the applicant provided a Local ID.
- **SSN** – This is the SSN or other Federal ID number specified on the electronic application.
- **Banner ID** – Used if you wish to enter an explicit ID to be used by Banner.
- **Generate ID** – Indicates that Banner should generate an ID for this person.

4. After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display GOAMTCH.
5. The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.

6. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
7. Once the data has been "cleaned up", use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
8. The incoming electronic application can be a match, a potential match, or a new record:
  - 8.1. If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - 8.2. If the incoming electronic application is found to be a potential match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - 8.3. If the electronic application is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.
9. If the person is found to be an exact match, you can do one of three things:
  - 9.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 9.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.
  - 9.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
10. After selecting one of the options above, the user will be returned to the Verification Steps window, and the ID Verification (*IDVR*) step will be marked as complete. Continue processing the electronic applicant as needed.
11. Verify the application data.

Select Verify Application from the Options Menu to verify the application data. Verification performs all verification procedures and routines attached to the application which have not been overridden.

After an application has been verified, its **Accepted Indicator** on the main window of SAAEAPS is set either to *E*, which indicates that errors were found during verification, or *V* for verification complete.

## 12. Review errors, override verification, or correct data.

If errors are encountered during verification, select Review Results from the Options Menu or use a Next Block function to review the results. The Verification/Load Results window is displayed.

In the System Verification Procedures section of this window, each procedure and its associated routines are displayed, one procedure at a time. You scroll through the procedures using the scroll bar or Next and Previous Record functions, and the associated routines are displayed for each procedure. As you scroll through the procedures, you can ignore any which have already been overridden or which have passed verification. (The **Completion (Indicator)** checkbox is checked.)

Verification errors must be resolved before the data can be loaded into the Banner permanent tables from the holding tables. You resolve verification errors by overriding the routine which failed or by overriding the entire procedure. If you override an individual routine, only the verification associated with the individual routine will be by-passed. If you override the procedure, none of the individual routines will be performed. Only those procedures or routines for which override is allowed (defined on SAAECRL) can be overridden. If you attempt to override a procedure or routine when an override is not allowed, an error message displays, and the override is not processed.

After overriding all routines or procedures that you wish to have ignored, use the Return button to return to the main window of SAAEAPS, and select Verify Application from the Options Menu to verify the information again. Only data which had not previously been verified is processed. Procedures in which you overrode routines can now be verified.

You should continue verifying data and overriding routines and procedures until verification is complete (the **Accepted Indicator** displays V for Verified). When you push data into the permanent tables, data for procedures which have been verified is loaded, regardless of the status of other data.

## 13. Load the verified information into the permanent tables.

Select Load Application from the Options Menu or use an Insert Record function to push the data to the permanent tables. After you have pushed the data, you can view the results by selecting Review Results from the Options Menu or by using a Next Block function to access the System Verification Procedure section of the Verification/Load Results window. Scroll until you reach procedure P900, the PUSH Verification Procedure. The routines associated with this procedure push actual pieces of data. Data has been pushed for routines which are complete, and the message associated with each completed routine will tell you the number of records created or updated.

## Changing PINs

There is one more option available on the Electronic Application Process Form (SAAEAPS), the Change PIN option, and it is not part of actual application processing.

You use the Change PIN option when an applicant has forgotten the PIN used to submit application information or when an applicant has been locked out of the non-student (non-secured) application processing component of self-service admissions.

To use the Change PIN option, select Change PIN from the Options Menu or use a Help function. The Non-Student PIN Change window is displayed. In this window, you can:

- view the existing PIN and report it to the applicant,
- change the applicant's PIN, or
- unlock a locked application.

## Review Applicant Information

If at any point you want to review the application information, either to determine why there are verification or load errors or to review application information which will not be loaded to the permanent Banner tables, use the Electronic Admissions Submitted Form (SAAETBL).

You can now work on another electronic application or move into other Banner forms to further process the applications you have pushed.

## Pushing Test Score Information

SATI and SATII test scores entered via EDI and pushed into the SORTEST table should have a value of *R* placed in the SORTEST\_RCRV\_IND field *if* the SORTEST\_TEST\_DATE is *greater than or equal to April 1, 1995*. This will ensure that the SOPSATS program and/or client-written programs don't try to further re-center these scores, as they should already be re-centered.

(These programs use the value or lack of a value in the SORTEST\_RCRV\_IND field in their determination of whether to re-center the test scores.)

The following rules need to be added to the Electronic Admissions Application Rules Form (SAAERUL) where the **Group** field is set to *TEST*. The **Value** field will be populated by SunGard Higher Education, as these are required values based on the Banner Test Code Validation Form (STVTEESC). Only those tests received via EDI that have a test code matching one of the test codes below should have the *R* added to the **Revised or Recentered** field on SOATEST. This is because only SAT I and SAT II tests were affected by the re-centering change. If additional SATII tests are added by ETS, SunGard Higher Education will add additional records to SAAERUL.

<b>Group</b>	<b>Label</b>	<b>Description</b>	<b>Value</b>
TEST	SATV	SAT Verbal Test	S01
TEST	SATM	SAT Math Test	S02
TEST	SATR	SAT Reading Subscore Test	S03
TEST	SATV	SAT Vocabulary Subscore Test	S04
TEST	SATAH	SAT American History/Social Studies	AH
TEST	SATBE	SAT Bio-Ecological Emphasis	BE
TEST	SATBM	SAT Bio-Molecular Emphasis	BM
TEST	SATBY	SAT Biology Emphasis	BY

## Addresses in Banner and Entered on the Web

Addresses entered via the Web that have the same address type as existing Banner addresses should be loaded as the next sequential address instead of not loading them at all. The rules for determining From and To dates for existing addresses and new addresses are detailed below.

When an address comes in via the Web and has the same address type as an existing Banner address the push process will:

- Select the most current Banner address of that address type. This is either the address with the correct address type that has a To Date equal to *Null* or the address with the correct address type that has a maximum To Date for that person. If two records are returned, then the one with the *Null* address is considered to be the most current (as *Null* equals valid until the end of time). This will be the address used in all comparisons below.
- If the incoming Web address matches the most current Banner address of the same address type, *do nothing*.
- Otherwise, determine how to update existing or *Null* To Dates and to insert new From Dates:
  - If the To Date (of the current Banner address) is *Null*,
    - Update the To Date of the current address with the *greater* of the From Date (of the current address) or SYSDATE minus one.

- Insert the new address with the From Date with the *greater* of the From Date plus one (of current address) or SYSDATE.

This code handles the problem of having someone submit multiple records on the same day with multiple different addresses.

- If the To Date (of current Banner address) equals the SYSDATE, insert the new address with a From Date of SYSDATE plus one.
- If the To Date (of current Banner address) is greater than SYSDATE, insert the new address with the From Date of the current addressee's To Date plus one.
- If the To Date is less than the SYSDATE, insert the new address with a From Date of SYSDATE.

## Quick Start Set-Up Procedures for Banner Student Self-Service

### Overview

Quick Start processing allows an institution to automatically process Web applications in a number of ways. It can be set up to automatically create a student record, taking the Web applicant directly to Banner Student Self-Service so they can register. It can also automatically create a recruit and/or application record, thereby eliminating the need to use SAAEAPS or run SARETMT. A decision record can be created too, as long as an application record is being created.

You must follow the instructions in the “Admissions Application Set-Up Procedures for Banner Student Self-Service” section before you can use Quick Start processing.

### Processing Steps

The following describes the steps required to use Quick Start processing. It is followed by a description of how Quick Start works behind the scenes.

1. Check the **Enable QuickStart Processing** checkbox in the Automated Processing Rules block on the Electronic Applicant Web Default Rules Form (SAAWADF).
2. Choose the Quick Start features you would like to use by checking the appropriate boxes.
  - **Automatically Create Recruit Record** - When checked, a recruit record will be created for the Web applicant.
  - **Automatically Create Application Record** - When checked, an application record will be created for the Web applicant.

- **Process Decision** - When checked, an application decision code can be entered in the **Admission Decision** field.
  - **Admission Decision** - When a decision code is entered, an admissions decision record will be created on SARAPPD.
  - **Provide Access to Student Self-Service** - When checked and the Web applicant has a student record, an **Access Web for Students** button will display on whichever signature page is displayed.
  - **Create One Application** - When checked, one recruit or application record will be created for all associated curricula. When unchecked, a new record will be created for each curriculum (major).
  - **Auto Student** - When checked (in the EDI and Self-Service block of the Majors and Departments window on SOACURR), a student record will be created on SGBSTDN, as long as no matching record is found on SOAEQUI.
3. Select the interface code associated with the correct matching source code for the matching rules to be used by Quick Start on the Web Matching Rules window of SAAWADF.
  4. Create letters to be used with Quick Start processing on SOAELTR.
  5. Associate the letters with the appropriate letter types on the Web Signature Letters window of SAAWADF.

## Behind the Scenes

Quick Start processing begins automatically when:

- The **Application Complete** button is pressed on the Web Application Checklist page, and credit card processing has been turned off for the application type on SAAWADF.
- OR -
- Credit card processing is enabled on SAAWADF and:
    - The applicant selects the **Pay Later** button on the Application Fee Payment page.- OR -
    - The applicant is prompted for the Signature page after successfully processing their credit card payment.

Then the following steps take place:

1. The match package is run to determine if the Web applicant matches an existing Banner person.
2. If the match package, returns a status of *S* (Suspended) or *E* (Error), then the application status code is updated on SAAEAPS, and the Display Signature package displays the letter code associated with the *SUSPENSE* or *MATCHERR* letter types respectively.
3. Quick Start processing checks to see if the **Automatically Create Application Record** box is checked. If it is checked, run the verification routines (the same routines as run on SAAEAPS or with the SARETMT process).

If any errors are encountered during the verification process, the **Application Status** field on SAAEAPS is updated appropriately, and the Signature Display package displays the letter assigned to the *VERERR* letter type on SAAWADF.

4. Now the `create_appl` package is run. It first checks for the existence of an application hold for the Web applicant (assuming they had matched someone in Banner).

If an application hold exists, then the **Application Status** field on SAAEAPS is updated appropriately, and the Display Signature package displays the letter assigned to the *APPLHOLD* letter type on SAAWADF. If no application hold exists, the application is created.

5. If the **Automatically Create Application Record** checkbox is checked, then you can optionally request that a decision record be created as well, by checking the **Process Decision** checkbox and entering a decision code in the **Admission Decision** field. Just as with SAAQUIK, no decision code with the **Inactive Application (Indicator)** checked on STVAPDC can be created.
6. If the **Automatically Create Recruit Record** checkbox is checked, run the `create_recruit` package to create a recruit record on SRBRECR.
7. If the **Create One Application** checkbox is checked, then one application will be created for all associated curricula. If unchecked, then a separate application will be created for each curriculum (major).
8. If the **Auto Student** checkbox is checked (in the EDI and Self-Service block of the Majors and Departments window on SOACURR) for the applicant's curriculum, Quick Start processing is allowed for that curriculum.
  - 8.1. If Quick Start processing is not allowed for the curriculum, then no student record will be created, and the letter associated with the *STANDARD* letter type

will be displayed. If you selected the option to create a recruit and/or application record, these will still be created.

- 8.2.** If Quick Start processing is allowed for the curriculum and the match status returned earlier is *N* (New), a student record is created for the Web applicant, and the Signature Page is displayed with the letter assigned to the *QUIKADMIT* letter type.
- 9.** If the match status returned earlier is *M* (Match), SOAEQUI is queried to see if the Web applicant's most recent Banner student record and Web application match any of the exception processing rules on the form.
  - 9.1.** If one or more rules match, then the rule with the highest priority number is used (1 = highest), and no student record is created. If that rule has a letter code associated with it, then that letter is displayed as the Signature Page.
  - 9.2.** If no letter code exists on the matching SOAEQUI record, then the letter associated with the *NOSTUREC* letter type is displayed. If no letter code has been assigned to the *NOSTUREC* letter type, then the letter associated with the *DEFAULT* letter type is displayed. If no letter has been assigned to the *DEFAULT* letter type, the default Web Tailor letter is displayed.

## Application Status Errors and Resolutions

The following are the possible application status codes that can be generated by the Quick Start process and how they may be resolved. They can be viewed on SAAEAPS.

Application Status Code	Description	Resolution
H	Admissions Hold	<p>If an admissions hold exists for an applicant, their application status will be updated to <i>H</i>, and their record cannot be pushed on SAAEAPS until the hold is removed on SOAHOLD. Even if the hold is removed, only an application record will be created, not a student or decision record.</p> <p>Perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Remove the hold on SOAHOLD, if appropriate.</li> <li>2. Run the Verification Process by selecting Verify Application from the Options Menu in the main window of SAAEAPS. This process will run even though the <b>Application Status</b> field is set to <i>H</i>.</li> <li>3. Run the Load Application process by selecting Load Application from the Options Menu in the main window of SAAEAPS. Assuming no other errors occur, the application should be pushed. It will not, however, automatically create a student record if that was indicated for the application type on SAAWADF. The institution will have to do that manually. It will create the recruit record though, if that was indicated on the Automated Processing rules window of SAAWADF.</li> <li>4. You can also run SARETMT to verify and push the application having an application status of <i>H</i>, as long as the hold has been removed.</li> </ol>
I	Can't Insert Decision Code	<p>This error is received when you are trying to create a student record, and the system knows that one or more of the rules governing the creation of a student record would be broken in doing so.</p> <p>For example, if a student record already exists for the same term as the newly created Quick Start application, the insert of a new student record would fail, as you cannot insert a new student record if one already exists for the same term.</p> <p>However, all other items defined by the indicators in the Automated Processing Rules window of SAAWADF, as well as items defined by the SAAECRL rules, will still be processed.</p> <p>So, the Quick Start applicant won't have a new student record created, but they could have an application record created, additional personal data updated on SPAPERS, test score data added, an application and recruit record created, etc.</p>

Application Status Code	Description	Resolution
P	Push Error	<p>This error rarely occurs. It is usually caused by invalid data or data that is not acceptable to the database because of indices. If a push error occurs, the part of the process receiving the error will not be pushed. All other pieces will be pushed though.</p> <p>For example, if a question/answer receives a push error, the recruit, application, and student record will still be created along with person data.</p>
R	Match Error	<p>Perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Use the Person Search and/or Create Person items in the Options Menu from the Applicant and Application Manual Verification window on SAAEAPS to mark the record with the match error as New or Matched.</li> <li>2. Mark any of the other manual verification steps as complete in the Manual Person Verification Steps block, and save the changes.</li> <li>3. Return to the main block, where the <b>Person Status</b> and <b>Application Status</b> fields should both be set to Y.</li> <li>4. Now you can either manually verify and push the application* on SAAEAPS or run the SARETMT process to automatically re-verify and push the application.</li> </ol> <p>* Please see the section called “Manually Matching, Verifying, and Pushing Electronic Applications” for more information.</p>
U	Suspended Record	<p>Perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Select the Verification Steps tab or the Manual Verification Steps option from the Options Menu to access the Verification Steps window.</li> <li>2. Select the ID Verification (<i>IDVR</i>) step, and then choose the Associate Person with ID item from the Options Menu.</li> </ol>

## Application

Status Code	Description	Resolution
-------------	-------------	------------

- This opens the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record from the **Select an ID** field.
  - Electronic ID** – This is the ID used by the applicant when the electronic application was submitted.
  - Local ID** – This is the locally assigned ID reported by the applicant when the electronic application was submitted. It is used for applications filed via EDI. For example, this may be a generated ID from another institution or the person's high school.
  - SSN** – This field displays the value reported by the applicant as a social security or other Federal ID number when the electronic application was submitted.
  - Banner ID** – This field is used to specify the ID which should be used when the SPRIDEN record is created for the applicant in Banner.
  - Generate ID** – This field indicates that Banner should generate an ID for this person.
- After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display the Common Matching Entry Form (GOAMTCH).
- The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.
- You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
- Once the data has been "cleaned up", use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
- The incoming electronic application can be a match, a potential match, or a new record:
  - If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - If the incoming electronic application is found to be a potential match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - If the electronic application is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.

## Application

Status Code    Description                      Resolution

---

9. If the person is found to be an exact match, you can do one of three things:
  - 9.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 9.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.
  - 9.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
10. After selecting one of the options above, the user will be returned to the Verification Steps window, and the ID Verification (*IDVR*) step will be marked as complete. Continue processing the electronic applicant as needed.

V	Verification Error	<p>You can go to SAAEAPS to try and override the verification error if the correct override indicators were set on SAAECRL.</p> <p>Perform the following steps:</p> <ol style="list-style-type: none"><li>1. Select the Review Results item in the Options Menu in the main window of SAAEAPS to access the Verification/Load Results window.</li><li>2. Scroll through the procedures in the System Verification Procedures block until you find the procedure(s) where the <b>Completion Indicator</b> checkbox is blank.</li><li>3. Select the <b>Override Indicator</b> checkbox for this procedure. If an override is allowed for this procedure, you can check the box and then save the change.</li><li>4. Return to the main block of SAAEAPS. You can either manually verify and push the application *, or you can run SARETMT to automatically re-verify and push the application.</li></ol> <p>* Please see the section called "Manually Matching, Verifying, and Pushing Electronic Applications" for more information.</p>
---	--------------------	--

## Using Accept Admissions Offer in Self-Service

You can use Banner Student Self-Service to allow an admissions applicant to view an offer of admission (with conditions if appropriate) and then confirm/accept the offer or reject the offer and withdraw the application from the institution.

Rules on SAAERUL for a group code of *DCSN* are used with this processing. (The group code of *DCSN* (*Applicant Decision*) exists on STVEGRP.) These rules use *UPDATE ME* values for which rule labels can be defined to allow students to accept the admissions decision in self-service. The *ALLOWCONFIRM* and *ALLOWWITHDRAW* rule labels can be set up as *Yes* or *No* values for specific levels, such as *ALLOWCONFIRM00* and

*ALLOWWITHDRAW00*. You can customize these rule labels at your institution and replace the *00* with a level type such as *UG* or another code suffix used to indicate that the student acceptance or withdrawal is available for that specific level code.

Once the student has made a decision in self-service to accept the offer of admission, that decision data is also updated on the Decision Data block of SAADCRV. If the student rejects the offer and withdraws the application in self-service, the withdrawal data is updated in the Withdrawal Data block on SAAADMS.

Please see the *Banner Student Self-Service User Guide* for more information.

## Processing

Students who have been accepted for admission to an institution can confirm their attendance or withdraw their applications in Banner Student Self-Service. The **Confirm Attendance** and **Withdraw Application** buttons are displayed at the bottom of the Application Summary page when the Web application section rule (SAAWAAP) allows the application summary to be displayed, and the **Display on Web** indicator is checked on STVAPDC for the admission application decision code.

The overall SAAERUL rule used is the *ALLOWDECISION* rule. If this rule is not set to *Y*, then regardless of how any other rule is set, the **Confirm Attendance** and **Withdraw Application** buttons will not be displayed.

To only display the **Confirm Attendance** button, the application status on SAADCRV must be set to *C* (Complete ready for review) or *D* (Decision made), with the latest decision processed being one of significant decision and institutional acceptance. The *ALLOWDECISION* rule on SAAREUL must be set to *Y*. If this rule is set to *N*, the button will not be used, and the student cannot accept the offer of admission online. Also, the *CONFIRMCODE* rule must be set up with a valid STVAPDC code, such as *35* (*Applicant Accept*), which will create the general student (learner) record.

The institution can be more specific regarding who can accept an offer by creating specific level code record rules. For example, an institution can create the *ALLOWCONFIRMUG* rule, where *UG* is a valid value on STVLEVL. All application types that have the *UG* level code associated with them will then follow this rule. An *ALLOWCONFIRM* rule can be created for every level code at your institution. Note that if only the *ALLOWCONFIRM* rule exists, this rule affects all levels of applications. This processing will first look for the “specific” level rule, and if that is not found, it will default back to the overall *ALLOWCONFIRM* rule.

The **Withdraw Application** button is displayed at all times unless the last decision processed was a rejection, (the **Institution Rejection** checkbox on STVAPDC is checked or set to *Y*), or if the application has already been withdrawn, (the **Inactive Application** checkbox on STVAPDC is checked or set to *Y*). The *ALLOWWITHDRAW* rule on SAAERUL must also be set to *Y* for this button to display. Also, the *WITHDRAW* rule must be set up with a valid STVAPDC code, such as *40* (*Applicant Rejected Offer*), which will inactivate the applicant record.

The institution can be more specific regarding who can withdraw from an offer by creating specific level code record rules. For example, an institution can create the *ALLOWWITHDRAWUG* rule, where *UG* is a valid value on *STVLEVL*. All application types that have the *UG* level code associated with them will then follow this rule. An *ALLOWWITHDRAW* rule can be created for every level code at your institution. Note that if only the *ALLOWWITHDRAW* rule exists, this rule affects all levels of applications. This processing will first look for the “specific” level rule, and if that is not found, it will default back to the overall *ALLOWWITHDRAW* rule.

The **Confirm Attendance** and **Withdraw Application** buttons can be customized using the *CONFIRMLABEL* and *WITHDRAWLABEL* rules on *SAAERUL*. Codes associated with the *CONFIRMCODE* or *WITHDRAWCODE* rules for the group code of *DSCN* (*STVEGRP*) are inserted into *SARAPPD* to separate the rule requirements appropriately.

The **Withdraw Application** button accesses the Applicant Withdrawal Information page when the *CAPTUREWDINFO* rule is set to *Y* on *SAAERUL*. This page allows the student to enter a withdrawal reason code (*STVWRSN*) and a source/background institution code (*STVSBGI*). The withdrawal reason comes from the *SAAWADP* entries associated with the *STVWRSN* table. The Look-Up College code is pulled from the Previous College page. If the *CAPTUREWDINFO* rule is set to *N*, the Application Summary page is redisplayed with the application decision for the decision code description associated with the *WITHDRAWCODE* rule on *SAAERUL*. The decision code associated with the rule must have the **Inactive Application** and **Display on Web** checkboxes checked (set to *Y*) on *STVAPDC*.

 **Note**

The *STVWRSN* table name on *STVV TAB* allows the institution to determine which withdraw reason values are displayed on the Applicant Withdrawal Information page. ■

Whether the *CAPTUREWDINFO* rule is set to *Y* or *N*, the *WITHDRAWCODE* rule will be inserted into *SARDCSN* with the system date, the *SARAPPD\_MAINT\_IND* will be set to *U*, and the user will be set to *SAISUSER*. When the Application Summary page is redisplayed with an updated decision, (*CAPTUREWDINFO* is set to *N*), then a message is displayed at the top of the page indicating that the student’s decision has been saved. Decision data is inserted into the *SARAPPD* table.

## SAAERUL Rules

There are two types of rules used on *SAAERUL* for this processing, those that are delivered and those that are created by your institution. The following rules are delivered for the group code of *DCSN* (from *STVEGRP*) with a value of *UPDATE ME*.

Group	Label	Description	EDI	Instructions
DCSN	ALLOWDECISION	Allow Applicant Decision	N	Update the Value column from <i>UPDATE ME</i> to <i>Y</i> or <i>N</i> for the applicant decision.
DCSN	CONFIRMCODE	Attendance Confirmation Decision Code	N	Update the Value column from <i>UPDATE ME</i> to the value from the Admission Application Decision Code Validation Form (STVAPDC) which should be used for the confirm decision code.
DCSN	CONFIRMLABEL	Applicant Confirm Button Label	N	Update the Value column from <i>UPDATE ME</i> to any value which should be used for the Applicant Confirm label.
DCSN	WITHDRAWLABEL	Applicant Withdraw Button Label	N	Update the Value column from <i>UPDATE ME</i> to any value which should be used for the Applicant Withdraw label.
DCSN	WITHDRAWCODE	Withdraw Decision Code	N	Update the Value column from <i>UPDATE ME</i> to the value from the Admission Application Decision Code Validation Form (STVAPDC) which should be used for the withdraw decision code.
DCSN	CAPTUREWDINFO	Capture Withdrawn Information	N	Update the Value column from <i>UPDATE ME</i> to <i>Y</i> or <i>N</i> for the additional withdrawn information.

The following rules can be created at your institution.

The *ALLOWCONFIRM* and *ALLOWWITHDRAW* rules can be created at your institution and the suffix modified for use with specific application levels. They use a value of *Y* or *N*. When only the *ALLOWCONFIRM* and *ALLOWWITHDRAW* labels exist, they will apply to all application types that are Web-enabled. (The **Web Indicator** is checked on STVWAPP.) When *ALLOWCONFIRM00* and *ALLOWWITHDRAW00* labels exist, where *00* is the student level code from STVLEVL, then only those application types will follow the rule. You can have unlimited rules, so the suffix on the label determines the rule that is displayed.

For example, you can set up the labels as specific decision codes for confirmation and withdrawal based on student level, such as *ALLOWCONFIRMUG* and *ALLOWWITHDRAWUG*, using the *UG* suffix for the rule.

Group	Label	Description	EDI	Instructions
DCSN	ALLOWCONFIRM00	Rule to be entered by user	N	Set to <i>Y</i> or <i>N</i> to use as the application confirmation rule. <i>00</i> is a valid level code (STVLEVL).
DCSN	ALLOWWITHDRAW00	Rule to be entered by user	N	Set to <i>Y</i> or <i>N</i> to use as the application confirmation rule. <i>00</i> is a valid level code (STVLEVL).

## Set-Up Steps

The following step-by-step procedure explains how to set up the accept admissions offer functionality in Student Self-Service.

1. Access the Electronic Admissions Applications Rules Form (SAAERUL).
2. Enter *DCSN* in the **Group** field in the Key block, then go to the next block.
3. Enter *Y* in the **Value** field for the *ALLOWDECISION* rule.

This must be done to allow applicants to use the web for their decisions. You can make more refinements, as explained in the following steps, but if the *ALLOWDECISION* rule is not set to *Y*, the **Confirm Attendance** and **Withdraw Application** buttons will not be displayed on the Application Summary page (bwska.sta.P\_Displ\_StatusSaradap) regardless of the other details you put in place.

4. Review the delivered codes, and take the action specified in the Instructions column as needed to achieve the setup you desire.
5. If you do not want the **Withdraw Application** button to be displayed on the Application Summary page *under any circumstances*, enter *N* in the **Value** field for the *ALLOWWITHDRAW* rule, and save your changes.
6. If you want to allow the **Withdraw Application** button to be displayed on the Application Summary page *based on the applicant's student level*, take the following actions.
  - 6.1. Create a new rule.
  - 6.2. Enter the rule's name in the **Rule Label** field, appending a valid student level code (from the Level Code Validation Form [STVLEVL]) to the rule label.

For example, if *UG* is your valid level code for *Undergraduate*, and you want to allow applicants at the UG level to withdraw, you could create a rule called *ALLOWWITDRAWUG*.

- 6.3. Enter the rule description in the **Rule Description** field.
  - 6.4. Enter *Y* in the **Value** field.
  - 6.5. Save your changes.
  - 6.6. Repeat steps 6.1 through 6.5 for each level for which you want to allow **Withdraw Application** button to be displayed on the Application Summary page.
7. If you want to allow withdrawing applicants to provide more information about their decisions using the Web, take the following actions.
- 7.1. Enter *Y* in the **Value** field for the *CAPTUREWDINFO* rule, and save your changes.  
  
If you set the *CAPTUREWDINFO* rule to *Y*, when a user selects the **Withdraw Application** on the Application Summary page, the system will display the Applicant Withdrawal Information page (*bwskadec.P\_ApplicantWDInfo*).
  - 7.2. Access the Admission Application Decision Code Validation Form (STVAPDC).
  - 7.3. Select the **Display on Web** check box for each decision code you want to be available on the Web, and save your changes.
  - 7.4. Access the Withdrawal Reason Code Validation Form (STVWRSN).
  - 7.5. Review the existing codes and, if necessary, define any new codes you want to be available, then save your changes.

## Admissions and Curriculum Processing in Banner Self-Service

Self-service processing can select and push minors and/or concentrations into Banner. The Planned Course of Study page in Banner Student Self-Service allows for the selection of multiple majors, as well as multiple minors and/or concentrations within each major. In baseline Banner, all entered majors, minors, and concentrations will be pushed to whatever record(s) the user has requested be created. The curriculum data will be pushed into the SORLCUR and SORLFOS curriculum tables. All controls in place for curriculum will be adhered to when the data are pushed.

Banner Student Self-Service Admissions functionality ties into existing rules which allow institutions to determine how many of each curriculum component can be entered. For example, concurrent curricula processing provides rules to determine how many active

majors can be entered for each curriculum. You can also decide, by Web application type and module, the maximum number of majors, minors, and concentrations that can be entered using the Web. This number should usually be less than or equal to the corresponding rules set on SOACTRL for each module code. However, if it is not, when the record is pushed into Banner, all data entered by the person will be pushed to the curriculum tables, but any data over the limits set on SOACTRL will be inactivated and given a status of *OVERLOAD*. For example, if a recruit is allowed to have three majors, and has entered three majors, but Admissions only allows for two majors, then all three majors are pushed to Admissions, but the third major is inactivated and given a status of *OVERLOAD*.

The *ONEAPPORTWO* rule on SAAERUL allows an institution to decide that when two majors are entered by the applicant, whether one application record should be created with two majors or whether two applications should be created with one major each. This also applies to recruits. Instead of using one rule (*ONEAPPORTWO*) on SAAERUL, an indicator that can be set by Web application type is used for applicants on SAAWADF. If the indicator is checked (*Y*), then one recruiting and/or application record will be created, and all curricula entered will be associated with that one record. If the indicator is unchecked (*N*), then a new record (recruiting or application) will be created for each major entered by the Web user.

You can select multiple curricula (majors, minors, and/or concentrations) in Self-Service based on baseline concurrent curricula functionality. You can also assign a curriculum priority and application preference for multiple applications. The Planned Course of Study page allows a user to first select a major, and then the user is given a choice of selecting another major or selecting a multiple of minors and/or concentrations to be associated with the first major. You can enter any number of majors, minors, and concentrations based on maximums set for a specific Web application type. When concentrations are displayed, all base concentrations for the given Web type/selected major will be displayed, along with any concentrations attached to the major, when that major has been selected by the user. This works in the same way as baseline processing but minimizes Web users having to know anything about the concept of “attached majors”.

## Pushing Curriculum Data

The SAKL010 package is used to push curriculum data to the SORLCUR and SORLFOS tables. Before inserting rows into SORLCUR and SORLFOS, this package first determines if the curriculum conversion routine should be run. If a person is matched to an existing Banner ID, the process determines if any rows exist in SORLCUR/SORLFOS for that ID/PIDM. If none exist, then the curriculum conversion is run to ensure that all pre-7.0 curriculum data is now stored in SORLCUR and SORLFOS. If the person is new, then the conversion does not need be run.

Curriculum data is moved or pushed from the temporary tables to Banner in a backward process. When a major (or minor or concentration beginning with Release 7.3) is entered in Banner Student Self-Service, a row is stored in SARETRY (for the curriculum), and another row is stored in SAREFOS for the major, (minor or concentration). These rows contain data for the degree and field of study from SOBCURR. A function is then called

which matches that data (the degree and field of study identifier) to the corresponding curriculum row/major in SOBCURR/SORCMJR. This process also handles minors and concentrations. As fields of study (majors, minors, and concentrations) are selected/entered in Banner Student Self-Service, an entry will be made into the SARETRY table for curriculum and the SAREFOS table for majors, minors and concentrations.

The logic for creating a single application record is as follows:

1. The process determines the SOBCURR rule to be used for the entered field of study (i.e, major, minor, or concentration).
2. If the SARWADF\_ONE\_REC\_APPL\_IND field is set to Y, then all majors, minors, and/or concentrations entered will be stored on one application instead of on multiple applications. If this indicator is set to N, skip to step 5.
3. If the curriculum rule that is returned already exists for the application in SORLCUR (and is active and current), it will not exist for the first field of study. However, the process will loop, and if two majors from the same curriculum are entered, only one row will exist on SORLCUR.
  - 3.1. If no matching curriculum rule already exists for the record, the process inserts an SORLFOS row for the field of study type (SAREFOS\_FLVL\_CDE cross-referenced against GTVLFST) and the field of study using the next value from a counter as the priority for the SORLFOS row.
  - 3.2. If a matching curriculum rule already exists for the record so there is no need to insert one, the process inserts an SORLFOS row for the field of study type (SAREFOS\_FLVL\_CDE) and field of study using the incremented counter value.
4. Steps 1 - 3 are repeated by the process by SARETRY\_SEQNO value, and within each SARETRY\_SEQNO value by SAREFOS\_SEQNO value. At this point, the storage of all curricula data for this application will be complete.

The logic for creating a multiple application records (i.e., one record per major entered instead of one record containing all curricula data) is as follows:

1. The process selects the first major (SARETRY\_SEQNO is 1) and creates a new record.
2. The process inserts an SORLFOS row for the field of study type (SAREFOS\_FLVL\_CDE cross- referenced against GTVLFST) and the field of study using the next value from a counter as the priority for the SORLFOS row.
3. When all the SAREFOS records for a given SARETRY row have been entered, the process determines if another SARETRY row exists. If one does exist, a new record is

created, and step 2 above is repeated. If no additional SARETRY rows exist, the process is finished.

 **Note**

The SAREFOS\_FLVL\_CDE field value determines what type of SORLFOS row should be inserted. This value *must* be cross-referenced using SORXREF (with a cross-reference label of GTVLFST) to determine the correct row type (major, minor, or concentration).

The values for MAJOR, MINOR, and CONCENTRATION are delivered as seed data. If additional types are developed at your institution for Self-Service, and/or you use EDI applications with other values, then those values *must* also be cross-referenced using SOAXREF/GTVLFST. ■

Field	Value	Description
SAREFOS_FLVL_CDE	M	Major
SAREFOS_FLVL_CDE	N	Minor
SAREFOS_FLVL_CDE	C	Concentration

## Setting Up Curriculum Processing for Self-Service Applications

Use the following steps to set up curriculum processing when applications are completed online.

1. Establish major codes on the Major, Minor, Concentration Code Validation Form (STVMAJR).
2. Create programs on the Program Definition Rules Form (SMAPRLE).
3. Create curriculum rules on the Curriculum Rules Form (SOACURR).
4. Set up the EDI values on SOACURR, and make sure that the **Display on Self-Service** checkbox is checked (set to Y) so the item is displayed on the Web.
5. Assign majors to be displayed in Self-Service on SOACURR.
  - 5.1. Use the **Display on Self-Service** checkbox to indicate that the major can be displayed in the self-service pulldown lists.
  - 5.2. The **Auto Student** checkbox is usually optional but is required if you are setting up a Quick Start application with an applicant acceptance decision. When this field is checked, the curriculum will be created on the learner curriculum record.

- 5.3. Use the **EDI Degree**, **EDI Level** (qualifier), and **EDI Identification** fields for setting up EDI data.

Prior to this release, the self-service application required that EDI codes be set up for each major that was available on the Web. All three EDI components were required: the **EDI Degree** value, the **EDI Level** (qualifier) value, and the **EDI Identification** value. All three fields had to contain valid values that had been defined on SOAXREF using the following labels:

- EDI degree values and SOAXREF label *DEGRLEVL*
- EDI level values (qualifier) and SOAXREF label *FSTYIDQL*
- EDI identification and SOAXREF label *STVMAJR*

The three codes make up the combination received from EDI that define the degree, level, and field of study. The EDI degree and EDI level (qualifier) remain constant. The EDI identification defines the field of study and the program of which it is a part. There may be many EDI identification values.

As of Release 7.3, the only requirement for ensuring a curriculum is valid for the self-service processing is to check **Display on Self-Service** checkbox on SOACURR.

Here is more information about each of the three EDI components, starting with the EDI level qualifiers.

The following is from the TS189 EDI application documentation and lists the code values for valid EDI level codes, also referred to as the Identification Code Qualifiers.

*Identification Code Qualifier*

Description: Field of Study Code Set Indicator

<b>Code</b>	<b>Description</b>
81	Classification of Instructional Programs (CIP) coding structure maintained by the U.S. Department of Education's National Center for Education Statistics
82	Higher Education General Information Survey (HEGIS) maintained by the U.S. Department of Education's National Center for Education Statistics
CA	Statistics Canada Canadian College Student Information System Course Codes
CC	Statistics Canada University Student Information System Curriculum Codes
ZZ	Mutually Defined

This relates back to SOAXREF and the *FSTYIFQL* label.

The following is from the EDI TS189 documentation for degree level codes. These codes have to be used if EDI processing is being used. It seems that EDI does not have a list of valid major codes. You could use the web application type value in this field.

*Data Element 1126 - Academic Degree Code*

Indicates the level of academic award being described. The decimal is part of the code and is to be sent.

<b>Code</b>	<b>Description</b>
2.1	Postsecondary Certificate or Diploma (less than one year)
2.2	Postsecondary Certificate or Diploma (one year or more but less than four years)
2.3	Associate Degree
2.4	Baccalaureate Degree
2.5	Baccalaureate (Honors) Degree
2.6	Postsecondary Certificate or Diploma (one year or more but less than two years)
2.7	Postsecondary Certificate or Diploma (two years or more but less than four years)
3.1	First Professional Degree
3.2	Post Professional Degree
4.1	Graduate Certificate
4.2	Master's Degree
4.3	Intermediate or Specialist Graduate Degree
4.4	Doctoral Degree
4.5	Post-Doctoral Award

This relates back to SOAXREF and the *DEGRLEVL* label.

The EDI identification defines the actual field of study. The new **Generate Identification** button on SOACURR creates these values for you. The entries will be found under the *STVMAJR* label on SOAXREF. The button performs the following tasks:

- generates a unique value for the curriculum and the field of study, and
- inserts degree and level qualifiers into SOAXREF under the *STVMAJR* label.

6. Assign minors and concentrations to be displayed in Self-Service.
7. Set up the EDI values on SOACURR, and make sure that the **Display on Self-Service** checkbox is checked (set to *Y*) so the items are displayed on the Web. (The EDI degree will be derived from the primary major.)
8. View the majors, minors, and concentrations by curriculum on the EDI Cross-Reference Curriculum Rules Form (SOAXCUR).

With the exception of the **Restrict to Type** checkbox on SAAWCUR, SAAWCUR and SOAXCUR are query only forms. SOACURR is used to customize Web application data.

9. Set up restrictions on Web Application Customized Curriculum Form (SAAWCUR). This step is not required, but it can be used to restrict the curriculum to a particular Web application type.

With the exception of the **Restrict to Type** checkbox on SAAWCUR, SAAWCUR and SOAXCUR are query only forms. SOACURR is used to customize Web application data.

Keep in mind that all curricula that have a checked **Web Display (Indicator)** and have the same level as the Web application type will appear in the list of valid programs, unless some have a checked **Restrict to Type (Indicator)**. A restriction on at least one curriculum restricts the list of available curriculum to just the ones with a checked **Web Display (Indicator)**.

#### **Note**

Restrictions are available only on the major and apply only to the primary major, otherwise known as the Planned Course of Study page in Self-Service. ■

10. Restrict curricula from being pushed to a general student (learner) record.

Use the **Auto Student** checkbox (in the EDI and Self-Service block of the Majors and Departments window on SOACURR) to prohibit a particular planned course of study from creating a learner curriculum.

This means that if the **Auto Student** checkbox (in the EDI and Self-Service block of the Majors and Departments window on SOACURR) is not checked for a particular major, and it appears on a Quick Start application that has an applicant acceptance decision, the learner curriculum will not be created if an applicant selects that program.

You can also restrict which curriculum will result in the creation of a learner curriculum, based on what the applicant has already been accepted into, by setting up equivalents on the Existing or Incoming Student Data Mapping Form (SOAEQUI).

## TS 189 Upload (SAR189U) of Electronic Applications

Your institution may upload electronic admissions applications in SPEEDE format (TS 189) received and processed by the EDI.Smart™ PC application, into the Banner Student System. This processing is optional, and requires that EDI.Smart has been installed and configured, and the appropriate Electronic Admissions Application set-ups have been completed. This processing supports Peterson electronic admissions applications, as well as other admissions applications transmitted via EDI (Electronic Data Interchange) which conform to TS 189 standards.

The TS 189 Upload Process is used to receive an electronic admissions application in SPEEDE (Standardization of Post-Secondary Education Electronic Data Exchange) format and to automate the entry of the admissions application data into the Banner Admissions module. It is assumed that the user is familiar with the procedures and processing of the Admissions module.

### EDI.Smart Requirements

EDI.Smart release 2.0 must be installed, with the most recent patches applied for processing TS 189 files. If you have any questions about your current release of EDI.Smart, or if you need patch diskettes, please contact the EDI.Smart ActionLine at either 1-800-522-4827 and follow the voice mail instructions, or send email directly to the Customer Support Center.

### Overall Data Requirements

The values transmitted in TS 189 admissions applications for various data elements conform to the standards specified by the SPEEDE committee. For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides. These EDI values are stored in the same Banner holding tables used to receive self-service admissions applications.

### Overview of Peterson Admissions Application Processing

The EDI.Smart PC application has received an admissions application and is ready for printing on the local printer, and is also ready for upload to the host. The process on EDI.Smart that accomplishes this upload is called `FLATUPLD`. It produces a file known as `MAP_UPLD.TXT` which can be found in the `INTFCE` subdirectory below the EDI.Smart root directory (usually `WEDISMT`).

This file must be moved (copied) to a destination on the host where Banner resides which the user specifies. This file is then parsed by the Pro\*C program SAR189U (Admissions Application TS 189 Upload). SAR189U can be run from job submission. The parsing process scans the flat file and puts the data into the same Oracle holding tables that are used for self-service admissions application processing. You may review the TS 189 applications from within Banner on the Electronic Application Process Form (SAAEAPS), as well as on the Electronic Application Submitted Form (SAAETBL). The TS 189 applications can be distinguished from Web applications on both forms by the value displayed in the **Source** field on the form. To search for EDI TS 189 applications on SAAEAPS, enter query mode, then enter “EDI” in the **Source** field, then execute the query.

Please refer to the Web information in the “Admissions Procedures” section of this chapter and the Admissions forms online help for more detailed information about the SAAEAPS and SAAETBL forms.

## EDI Set-Up Procedures

### **Warning**

Due to data relationships and dependencies, these steps must be performed in the order specified. ■

#### 1. Review General Web controls.

Set up the global Web rules using Customize Web Rules in Web Tailor. Set up the title, header, back URL and link, and help URL and link fields using Customize a Web Menu or Procedure in Web Tailor. If these rules, links, and fields have not been reviewed and customized for your institution, do this now.

#### 2. Define values on validation forms used in EDI admissions application processing.

**2.1.** Use the EDI Application Source Code Validation Form (STVAPLS) to define codes and descriptions for the sources of electronic applications.

**2.2.** Use the Application Verification Steps Validation Form (STVASTA) to define the manual steps that you want to perform for each electronic application. One value is required: ID Verification (*IDVR*). For every electronic application received, you will need to determine whether the application was submitted by a person already known to Banner (for example, someone who is already being recruited) or whether the applicant does not yet exist in Banner. The ID Verification Step prevents the loading of an electronic application until you complete the verification and either match an electronic applicant to an existing Banner person or create the person in Banner. You may also wish to define additional manual verification steps.

**2.3.** Use the Application Type Code Validation Form (STVWAPP) to define the types of applications which can be received electronically.

Several application types are delivered with the Banner Student Self-Service system:

- Undergraduate Freshman
- Undergraduate Transfer
- International Undergraduate Freshman
- International Undergraduate Transfer
- Graduate Studies
- International Graduate Studies
- Continuing Education, Non Degree

- 2.4.** Use the EDI Rule Group Validation Form (STVEGRP) to display codes and descriptions for groups of EDI application processing rules. Group codes are provided so that rules which apply to similar types of data can be easily queried on the Electronic Admissions Application Rules Form (SAAERUL).

 **Note**

Values in STVEGRP are not intended to be maintained locally. All required values are delivered by SunGard Higher Education and inserted during the install process and/or via update scripts. This form and its data are provided to support other forms, and no changes of any kind should be made to the data on this form. ■

- 2.5.** Use the EDI Verification Label Validation Form (STVXLBL) to display codes and descriptions for EDI data verification labels which are used when processing a variety of incoming EDI data.

 **Note**

Values in STVXLBL are not intended to be maintained locally. All required values are delivered by SunGard Higher Education and inserted during the install process and/or via update scripts. This form and its data are provided to support other forms, and no changes of any kind should be made to the data on this form. ■

- 3.** Review and update or define the Procedures and Routines for each application type.

Before loading data from the holding tables into the permanent Banner tables, you want to make sure that the information submitted by the applicant is as complete and correct as it can possibly be. Application Procedures and Routines perform much of this work.

A Procedure is a collection of Routines. Routines check data at the data element level, and a number of Routines may be included in a Procedure. Procedures are closely related to each table into which data will be loaded. All required Routines must be satisfied before a Procedure can be satisfied. A set of Procedures and Routines has been delivered and is attached to each of the delivered Application Types. Procedures and Routines are attached to each Electronic Application Type using the Electronic Admissions Procedure/Routine Control Form (SAAECRL). This form also includes

several flags which specify how each procedure and routine will be used in electronic application processing.

Both the Procedures section of the main window and the Routines section of the Admissions Verification and Load Routines window include a **Required** flag and an **Override** flag.

- 3.1. The **Required** flag is used to specify the Procedures and Routines which will be attached to each electronic application when it is received. When a Procedure or Routine is attached to an application, it needs to be fulfilled before the application is considered verified and before the data is “pushed” to the permanent Banner tables. More specifically, each Routine needs to be fulfilled before the overall procedure can be satisfied.

The Procedures and Routines in effect control the types of data which will be verified and eventually “pushed” into Banner. You can set Procedures and Routines to “Not Required” if you do not wish certain data to be verified and/or loaded into Banner.

For example, you might choose not to load Medical Conditions from electronic applications. You would set the **Required** flag for Procedure P060 (Health Conditions Verification) to unchecked (*N*), and also set the **Required** flag for Routine R0080 (Create Medical Conditions) in Procedure P900 (“PUSH” Verification) to unchecked (*N*). This would tell the system not to verify Medical Conditions and not to push them into Banner.

- 3.2. The **Override** flags associated with Procedures and Routines allow you to specify whether a Routine or Procedure can be overridden at the individual application level. If a Routine or Procedure is overrideable, it will still be attached to an electronic application (based upon the **Required** flag), but can be overridden if desired.

For example, you may normally collect required visa types from international applicants, but not all applicants may understand the visa type they require. You could require visa types from international applicants, but allow the “push” of visa information to be overridden if an applicant does not provide the correct information. In this case, you would set the **Required** flags for Procedure P032 (International Information Verification) and all of its Routines to checked (*Y*), but set the **Override** flag for Routine R0030 (Create International Record) in Procedure P900 (“PUSH” Verification) to checked (*Y*) so that you could override the push of this information.

If a procedure has the **Override** flag checked, that procedure will be automatically overridden, regardless of whether any of its routines fail.

If a routine has the **Override** flag checked, it will automatically be overridden if the corresponding data field is blank. The only time it will not be over-riden is if the incoming data is in error.

Because you cannot control the amount or accuracy of data provided by applicants in electronic applications, you may need to experiment before you arrive at the “best” combination of Required and Override flags on the verification procedures and routines. Remember, the more procedures and routines you require, the fewer applications that will probably pass all edit checks and be eligible to load.

- 3.3.** Duplicate processing is governed by rules set up in two places. First, overall duplicate processing rules exist on the Electronic Admissions Application Rules Form (SAAERUL) under group *ADMS*. These rules are: *DUPLAPPLCURR*, *DUPLAPPLLEVL*, *DUPLAPPLMAJR*, *DUPLAPPLPERS*, *DUPLAPPLTERM*. These rules tell the self-service admissions push packages whether to check for duplicates in the given category.

For example, if *DUPLAPPLPERS* is set to *N*, then the corresponding Web package will not check for duplicate persons for the Web application being pushed.

**Note**

The *DUPLAPPLCURR* rule is not currently used in self-service admissions processing. ■

Duplicate processing rules also exist on the Electronic Admissions Procedure/Routine Control Form (SAAECRL). These rules allow for duplicate processing to be specified by application type instead of globally for all Web applications. The rules exist within procedure P050 Application Verification (R0060 - Duplicate Application for Person, R0070 - Duplicate Application for Term, and R0080 - Duplicate Application for Level) and procedure P120 Entry Curriculum Verification (R0010 - Duplicate Application for Major). These routines are examined if the corresponding rule on SAAERUL is equal to *Y*.

Whether a specific routine allows duplicates depends on the setting of the **Override** flag. If the **Override** flag is unchecked, then duplicates are not allowed. If the **Override** flag is checked, then duplicates are allowed. For example, if *DUPLAPPLTERM* is set to *Y*, routine R0070 is marked as required, and the **Override** flag is checked, then multiple applications for the same term are allowed. However, if *DUPLAPPLLEVL* is set to *Y*, routine R0080 is marked as required, and the **Override** flag is *not* checked, then the Web application will not be pushed if one already exists in Banner for the same term and level.

For Web Application Types delivered by SunGard Higher Education, all appropriate procedures and routines have already been attached to each application type. If you define additional application types, you need to attach the appropriate procedures and routines to each new application type. You can do so manually, using the delivered application type *00* (Default Example - All Sections) for example, or you can have

your Information Services representative copy the procedures and routines from Application Type 00 for you.

 **Note**

Please see the end of the “EDI Set-Up Procedures” for a list of the procedures on SAAECRL and their associated routines. ■

4. Review and update rule values on the Electronic Admissions Application Rules Form (SAAERUL).

The Electronic Admissions Application Rules Form includes a number of rules which control how data is handled in EDI admissions application processing. All rules which are used by system processing have been delivered by SunGard Higher Education and should have been installed during the upgrade process.

For convenience purposes, Rules are categorized by Group. Rule groups are used to display rules with a similar purpose together, and Group Codes can be used to specify that you want to display only a single group of rules at one type.

Each Rule is also identified by a Label and a Description. The script which installed the Rule Groups and Rules also installed either the specific value expected for a rule or the literal *UPDATE ME* in the **Value** field. When an actual value was delivered, its **EDI Indicator** was also checked (set to *Y*) indicating that the rule expects an EDI value, and the value for these rules should not be changed. When the literal *UPDATE ME* was delivered, the value must be updated to reflect the local option for Web and EDI application processing to be used.

When reviewing and updating rules, you may want to query on the **Value** field for the value *UPDATE ME*, or query on the **EDI Indicator** for the value unchecked (*N*). Either query will return the rows you need to review update. After updating the appropriate rows, you may want to review all rules so that you better understand how data will be processed.

 **Note**

Please see the end of the “EDI Set-Up Procedures” for a list of the rules delivered, the group with which they are associated, a description of each rule, and instructions for updating each rule. ■

5. Review/Update EDI cross-reference values on existing validation forms and run scripts to populate SOAXREF (optional), or add cross-reference values for the tables to SOAXREF manually.

To translate the various EDI values to your institution-specific Banner values, the EDI Cross-Reference Rules Form (SOAXREF) must be populated as required.

A number of existing validation forms (STVSTAT and STVNATN, for example) include EDI values. These values are not used in EDI application processing. Rather, all cross-reference information for processing of EDI applications is included in the EDI Cross-Reference Rules Form (SOAXREF). However, cross-reference values in some validation tables and those required in the EDI Cross-Reference Rules Form are

the same. Scripts have been delivered to help with the creation and maintenance of these values. These scripts extract data from existing tables and populate SOAXREF. The scripts are designed to be able to be run as often as necessary, so that if you make changes or add additional data to the validation forms, you can re-populate SOAXREF with the entire set of new values.

 **Warning**

You are not required to populate the EDI values in other validation tables or to use the sample scripts, but appropriate values must exist in SOAXREF before EDI application processing can begin. If you do not use the scripts, you must populate SOAXREF using other means (manual update or locally-developed scripts). ■

 **Warning**

If you choose to add records to SOAXREF manually, you must first add the appropriate label and description to the EDI Verification Label Validation Form (STVXLBL). These labels are normally inserted by the scripts described in the following sections. If you must add the labels manually, use the label code from the Cross Reference Labels Used In EDI Processing chart at the end of this section. Be careful to build the label code *exactly* as listed in the chart. ■

In some cases, you may have more than one Banner value mapped to a single EDI equivalent. This is allowable when you are creating files to transmit out via EDI, but is not allowable when you receive EDI data. When running the scripts to populate the EDI Cross-Reference Rules Form (SOAXREF), the script may encounter errors if an EDI value is used more than once within a set of codes.

You may review and correct the EDI Cross-Reference Rules Form values later. Remember, these scripts are provided as a data entry and time-saving convenience, and may not populate all desired EDI Cross-Reference Rules.

## Define EDI cross-reference values for states/provinces

- Update the **EDI Equivalent** on the State/Province Code Validation Form (STVSTAT) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefstat.sql`. This script creates a row in the table SORXREF for each row in STVSTAT which has an EDI Equivalent value.

 **Note**

This script can be run whenever states/provinces are added to or changed on STVSTAT. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVSTAT. ■

## Define EDI cross-reference values for nations

- Update the **EDI Equivalent** on the Nation Code Validation Form (STVNATN) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefnatn.sql`. This script creates a row in the table SORXREF for each row in STVNATN which has an EDI Equivalent value.

### Note

This script can be run whenever nation codes are added to or changed on STVNATN. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVNATN. ■

## Define EDI cross-reference values for ethnicities

- Update the **EDI Equivalent** on the Ethnic Code Validation Form (STVETHN) with the appropriate EDI values.

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefethn.sql`. This script creates a row in the table SORXREF for each row in STVETHN which has an EDI Equivalent value.

### Note

This script can be run whenever ethnic values are added to or changed on STVETHN. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVETHN. ■

## Define EDI cross-reference values for majors

- Review the values in the **CIPC** field on the Major, Minor, Concentration Code Validation Form (STVMAJR).

For US institutions, values used should be actual CIP (Classification of Instructional Program) codes. For institutions in other countries, a different code set (like Stats Canada codes) might be used. Determine the EDI code set used for this field; the valid choices are listed on SOAXREF for the Label *FSTYIDQL*. Verify that the value for the rule label *DFLTMAJRQLFR* on the Electronic Admissions Application Rules Form (SAAERUL) contains the EDI qualifier for this code set. (If CIP codes are used in the **CIPC** field on STVMAJR, the EDI value for this label should be *8I*.)

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

- Have your Information Services representative run the script `xrefmajr.sql`. This script creates a row in the table SORXREF for each row in STVMAJR which has a value in the CIPC field.

 **Note**

This script can be run whenever values are added to or changed on STVMAJR. It will always delete all values from SOAXREF (table SORXREF) and re-populate it with the current values from STVMAJR. ■

## Define EDI cross-reference values for high schools and colleges

Four scripts are used to assist in building the cross-reference values for high schools and colleges. The scripts `xrefhsch.sql` and `xrefcoll.sql` use the value in the **FICE** field of the Source/Background Institution Code Validation Form (STVSBGI) as the EDI value in SOAXREF. The scripts `xrefhsc2.sql` and `xrefcol2.sql` use the value in the **Source or Background Institution** field of *STVSBGI* as the EDI value in SOAXREF. You can use one or the other set of scripts to populate high school and prior college values in SOAXREF, depending upon the choices you wish to make available to applicants.

The page requests a “school type” code and “school code type”. The school type code must be a valid value in SOAXREF for the label *SBGIQLFR*, and the values for this qualifier should be EDI-standard qualifiers for various code sets (like FICE or ACT). The school code entered must be a valid value in SOAXREF for the label *STVSBGIC* or *STVSBGIH* which is valid for the entered school code type.

If your institution chooses to use the value in the **FICE** field of *STVSBGI* as the code which students should use to identify a high school or college, follow the four bulleted steps below, and use the scripts `xrefhsch.sql` and `xrefcoll.sql` to populate high school and college values in SOAXREF. If your institution has used a standard code set (like ACT or ETS codes) for school codes in *STVSBGI*, no additional set-up steps are required, and you can use the scripts `xrefhsc2.sql` and `xrefcol2.sql` to populate high school and college values in SOAXREF.

- Review the values in the **FICE** field on the Source/Background Institution Code Validation Form (STVSBGI).
- For US institutions, values used should be actual FICE codes. For institutions in other countries, a different code set (like Stats Canada codes) might be used. Determine the code set used for this field. Verify that value for the label *DFLTPCOLQLFR* and group code *PCOL* on the Electronic Admissions Application Rules Form (SAAERUL) contains the EDI qualifier for this code set.

(If FICE Codes are used in the **FICE** field on STVSBGI, the EDI value for this Group and Label should be 73.)

For a complete, current set of EDI values, consult the Postsecondary Electronic Standards Council (PESC) website [www.pesc.org](http://www.pesc.org), where a link is provided to EDI Implementation Guides.

 **Note**

If you use FICE codes for STVSBGI institution codes, you have not previously been required to repeat this value in the **FICE** field. For the purposes of this script, the FICE code must be in the **FICE** field. ■

- If FICE codes (or the values from another appropriate code set) are not present on STVSBGI, update the rows with the appropriate values.
- Have your Information Services representative run the scripts `xrefcoll.sql` and `xrefhsch.sql`, which are used to create a row in the table `SORXREF` for each row in STVSBGI which has a value in the **FICE** field and either *H* (High School) or *C* (College) in the **Type** field. These scripts can also use the school's city, state/province, and nation, which are maintained on the Source or Background Institution Base Form (SOASBGI) in creating the SOAXREF description which will display on the Web. Review the scripts and their options with your Information Services representative before running them. Complete instructions for customizing the scripts to reflect that your local choices are included in the comments of the scripts, which your Information Services representative can review with you. Review the results in SOAXREF for the labels *STVSBGIC* and *STVSBGIH* to see if the Descriptions appear in the way you want them to display on the Web. If not, re-run the scripts, selecting a different option for creating the Description, or update the descriptions manually.

 **Note**

These scripts can be run whenever values are added to or changed on STVSBGI. All values will always be deleted from SOAXREF (table `SORXREF`), and the table/form is then re-populated with the current values from STVSBGI. ■

**6. Review/Update EDI or other cross-reference values on the EDI Cross-Reference Rules Form (SOAXREF).**

The EDI Cross-Reference Rules Form is used to translate incoming EDI data into Banner values. A number of scripts are used to make building the SOAXREF table easier. These scripts were provided for data entry and time-saving convenience and will *not* be updated to reflect additional EDI values in the future. However, they give you a large base of information to begin with.

Not all rows in SOAXREF are used to process incoming TS 189 transaction sets received via EDI. Some are used in processing Banner self-service admissions applications.

\**DEFAULT*\* and \**NULL*\* rules can also be defined in SOAXREF, but they are appropriate *only* to processing of TS 189 transaction sets received via EDI.

 **Note**

The values *DEFAULT* and *NULL* (without the \*) are also used for EDI verification and loading. If the user wants to load the high school or prior college, even if the student enters only the name of an institution, the value on the *NULL* record is used on the SORPCOL and SORHSCH tables. If the source/background institution code entered by the student is not in the SOAXREF *STVSBGIC/STVSBGIH* crosswalk, the Banner value with *DEFAULT* is used. ■

 **Note**

Please see the end of the “EDI Set-Up Procedures” for a list of the labels used on SOAXREF. ■

## 7. Review curriculum rules and define EDI cross-reference curriculum rules.

In Banner, a student's academic program is defined by a combination of the data elements program, campus, college, level, degree, and major, and these data elements must be valid alone and in combination. When an applicant completes an application for admission, it is not likely that the applicant would know all of the valid combinations of these elements. In EDI applications, many of these data elements will need to be derived.

To map EDI values to Banner, use the Curriculum Rules Form (SOACURR). A script has been provided to create rules from all current existing data, and a new curriculum cross-reference rule is created whenever a new curriculum rule is added on SOACURR. Before beginning EDI application processing, you need to update the curriculum cross-reference rules with appropriate EDI values.

The Curriculum Rules Form (SOACURR) displays information for each major curriculum rule and the base rule to which it is attached. You need to update the **EDI Degree** field value. The values for the **EDI Level** (qualifier) and **EDI Identification** fields are retrieved by matching the major code from the curriculum rule to a row in SOAXREF.

- The **EDI Degree** field must be updated to a valid value in the label *DEGRLEVL* (Degree Level Codes) from the EDI Cross-Reference Rules Form (SOAXREF). This field defines the generic level of the degree program for which the applicant is applying.
- The **EDI Level** (qualifier) field must be updated to a valid value in the label *FSTYIDQL* (Field of Study Qualifier Codes) from the EDI Cross-Reference Rules Form (SOAXREF). This field defines the EDI qualifier for the code set used for Field of Study Codes, which will be entered in the next field.
- The **EDI Identification** field must be updated to a valid value in the label *STVMAJR* (Field of Study Identifier Codes) from the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) for a rule using the EDI Field of Study Qualifier entered in the previous field. This field defines the subject matter of the intended field of study.

 **Warning**

If possible, you should *not* use the same combination of EDI degree level, EDI field of study qualifier, and EDI field of study identifier for more than one curriculum rule when defining your EDI curriculum cross-reference rules. If you do, EDI processing will be unable to map the combination back to a single major curriculum rule. In this situation, the default values for the group code *CURR* (curriculum rules) maintained on the Electronic Admissions Application Rules Form (SAAERUL) are used when the application is loaded into the permanent Banner application tables. ■

**8.** Establish dates for receipt of EDI applications.

The TS 189 transaction set does not include a data element to identify or specify an entry term for the admissions application. The EDI Cross-Reference Term Code Rules Form (SAAECTM) is used to derive an entry term for the application, based on the entry date. When a TS 189 application is received via EDI, the requested entry date is compared to the date ranges defined in this form, and the term code associated with the date range which includes the supplied date is used as the application term.

If no date range includes the supplied date, the date range with the earliest start date which is greater than the supplied date will be used. If there is no date range which either includes the supplied date or one with a start date greater than the supplied date, the application will not be loaded for processing.

When date ranges and terms are entered, the form edits to ensure that no date ranges overlap any other date ranges. Multiple date ranges can be associated with the same term, but date ranges can not overlap.

The query section of the form is used to assist in determining the term which will be assigned for any given date. Entering a date in the **Search Date** field displays the term code derived from the date, if any is available. If not, the message “*No Term Found For Date*” displays in the **Term Description** field to indicate that no term can be derived from the supplied date.

Banner is now ready for you to accept EDI admissions applications.

## Procedures Used in EDI Processing

The following table is a list of the procedures on SAAECRL that are delivered for the Web application type of *00*.

Procedure	Procedure Name	Required	Override	Description
P010	ID Verification	Y	N	The routines associated with this procedure verify whether a valid ID exists.
P020	Name Verification	Y	N	The routines associated with this procedure verify whether a valid name exists. A valid name in Banner must include a first name and a last name.
P030	Biographic Information	Y	Y	The routines associated with this procedure verify whether valid biographic information exists.
P032	International Information	Y	Y	The routines associated with this procedure verify whether valid international information exists.
P035	Residency Verification	Y	Y	The routines associated with this procedure verify whether valid residency information exists.
P040	Address Information	Y	N	The routines associated with this procedure verify whether a valid address exists.
P045	Email Verification	Y	Y	The routines associated with this procedure verify whether a valid email address exists.
P050	Application Verification	Y	N	The routines associated with this procedure verify whether a valid application exists.
P060	Health Conditions Verification	Y	Y	Not used unless Health Question section is implemented.
P070	Phone Record Verification	Y	Y	The routines associated with this procedure verify whether a valid phone record exists.
P080	Religion Verification	Y	Y	The routines associated with this procedure verify whether a valid religion exists.
P090	Language Record Verification	Y	Y	The routines associated with this procedure verify whether a valid language record exists.
P100	Immunization Record	Y	Y	Not used at this time.
P110	Applicant Activities	Y	Y	The routines associated with this procedure verify whether valid applicant activities exists.
P120	Entry Curriculum Verification	Y	N	The routines associated with this procedure verify whether a valid entry curriculum exists.
P130	High School Verification	Y	Y	The routines associated with this procedure verify whether a valid high school exists.

Procedure	Procedure Name	Required	Override	Description
P135	High School Subj. Verification	Y	Y	The routines associated with this procedure verify whether valid high school subjects exist.
P140	Previous College Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college exists. This procedure is not required if the application type will not collect this information i.e., the person is a freshman and has no prior college information.
P142	Prv. Col. Degree Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college degree exists.
P145	Prv. Col. Major Verification	Y	Y	The routines associated with this procedure verify whether a valid previous college major exists.
P150	Test Score Verification	Y	Y	The routines associated with this procedure verify whether valid test scores exist.
P160	Relative Information Verification	Y	Y	The routines associated with this procedure verify whether valid parental information exists.
P170	Question Answer Verification	Y	Y	The routines associated with this procedure verify whether valid questions and answers exist.
P175	Requested Materials Verification	Y	Y	The routines associated with this procedure verify whether valid requested materials exist.
P200	Data Relationship Procedure	Y	Y	The routines associated with this procedure verify whether a valid data relationship procedure exists.
P900	"PUSH" Verification	Y	N	The routines associated with this procedure verify whether a valid PUSH exists.

## Routines Used in EDI Processing

The following table is a list of the routines on SAAECRL, organized by procedure.

Procedure	Routine	Routine Name	Required	Override
P010	R0010	Valid ID Found	Y	N
P010	R0020	ID Length Check	Y	N
P010	R0200	ID New to Banner; Create PrevID	Y	N

Procedure	Routine	Routine Name	Required	Override
P010	R9001	Edit Results	Y	N
P020	R0010	First Name Check	Y	N
P020	R0020	Last Name Check	Y	N
P020	R0030	Previous Last Name Check	Y	Y
P020	R9001	Edit Results	Y	N
P030	R0010	Date of Birth Established	Y	Y
P030	R0020	Ethnicity Established	Y	Y
P030	R0025	Race Established	Y	Y
P030	R0030	Ethnic Category Established	Y	Y
P030	R0031	Veteran Established	Y	Y
P030	R0040	Legacy Established	Y	Y
P030	R0060	Marital Status Established	Y	Y
P030	R0080	Gender Established	Y	Y
P030	R0090	Citizenship Established	Y	Y
P030	R0091	Nation of Citizenship Est	Y	Y
P030	R0110	Native Language Established	Y	Y
P030	R0130	Home Language Established	Y	Y
P030	R0150	Corresponding Lang. Est	Y	Y
P030	R0200	Overwrite Existing Gender	Y	Y
P030	R0210	Overwrite Existing Birthdate	Y	Y
P030	R0220	Overwrite Existing Citizenship	Y	Y
P030	R0230	Overwrite Existing Confidential	Y	Y
P030	R0240	Overwrite Existing Religion	Y	Y

Procedure	Routine	Routine Name	Required	Override
P030	R0250	Overwrite Existing Marital St	Y	Y
P030	R0255	Overwrite Existing Race	Y	Y
P030	R0260	Overwrite Existing Ethnicity	Y	Y
P030	R0265	Overwrite Ethnic Category	Y	Y
P030	R0270	Overwrite Existing SSN	Y	Y
P030	R0280	Overwrite Existing Legacy	Y	Y
P030	R0290	Overwrite Existing Veteran	Y	Y
P030	R9001	Edit Results	Y	N
P032	R0010	VISA Type Established	Y	Y
P032	R0020	VISA Number Established	Y	Y
P032	R0030	VISA Issue Date Established	Y	Y
P032	R0040	VISA Expiration Date Established	Y	Y
P035	R0010	Residency Established	Y	Y
P035	R9001	Edit Results	Y	N
P040	R0010	Address Type Code Established	Y	N
P040	R0030	Street Line 1 Established	Y	N
P040	R0040	City Established	Y	N
P040	R0050	State Code Established	Y	N
P040	R0060	County Code Established	Y	Y
P040	R0070	ZIP Code Established	Y	N
P040	R0080	Nation Established	Y	Y
P040	R0090	Address Data Relationships	Y	N
P040	R9001	Edit Results	Y	N

Procedure	Routine	Routine Name	Required	Override
P045	R0010	Email Type Established	Y	Y
P045	R0020	Email Address Established	Y	Y
P045	R9001	Email Record Existence Check	Y	N
P050	R0010	Application Type Established	Y	N
P050	R0020	Type Code Established	Y	N
P050	R0030	Source Established	Y	Y
P050	R0050	Application Term Established	Y	N
P050	R0060	Dupl Application for Person	Y	N
P050	R0070	Dupl Application for Term	Y	N
P050	R0080	Dupl Application for Level	Y	N
P050	R9001	Edit Results	Y	N
P060	R0010	Medical Condition Established	Y	Y
P060	R9001	Edit Results	Y	N
P070	R0010	Phone Number Type Established	Y	Y
P070	R0020	Phone Number Established	Y	Y
P070	R9001	Record Existence Check	Y	N
P080	R0010	Religion Established	Y	Y
P080	R9001	Edit Results	Y	N
P090	R0010	Language Established	Y	Y
P090	R0020	Language Use Established	Y	Y
P090	R0030	Language Proficiency Estb.	Y	Y
P090	R9001	Edit Results	Y	N

Procedure	Routine	Routine Name	Required	Override
P100	R0010	Immunization Established	Y	Y

P900	L175	Create Materials	Y	Y

## Rule Groups Used in EDI Processing

The following table is a list of the rule groups and codes on SAAERUL that are used by EDI processing.

Group Code	Group Name	Description
ADDR	Address Source Rules	Rules in which you specify address source codes to be used in electronic admissions application processing.
ADMS	Admission Rules	Rules which control the loading of duplicate applications and residency information for applications.
ATYP	Address Type Rules	Rules used to specify the address types to be assigned to addresses received in electronic applications.
CQLF	Code Qualifiers	Rules used to specify the EDI code qualifier for types of data which require special processing.
CURR	Curriculum Rules	Rules used to translate received information into valid Banner curricula.
DTQL	Date/Time Qualifier Rules	Rules which specify the EDI qualifier that describes specific kinds of dates.
ENTY	Entity Rules	Rules which specify EDI entity types.
FLVL	Field of Study Level Rules	Rules which specify the EDI qualifiers that describe majors and minors.
LGCY	Legacy Rules	Rules which define the Banner legacy type code to assign to specify relationship types.
PATH	System Path Rules	Rules which describe the database path in which various system components have been installed.
PCOL	Prior College Rules	Rules which are used to process prior college information.
PQLF	Phone Qualifier Code Rules	Rules which contain certain EDI telephone type qualifiers.
QSTN	Question Code Rules	Rules which specify the EDI question number where certain types of desired information may be reported.
RESD	Residency Rules	Rules used to assist in residency determinations.
RFQL	Reference Qualifier Rules	Rules which supply EDI reference qualifiers for specific kinds of information.
RLTN	Relationship Qualifier Rules	Rules which supply EDI qualifiers for relationship types.

Group Code	Group Name	Description
TELE	Telephone Pattern Rules	Rules which define the standard format for telephone numbers which are reported by your applicants.
VCRL	Verification Control Rules	Rules which control several of the verification procedures and routines.

## Delivered Rule Groups Used in EDI Processing

The following table is a list of the rules delivered, the group with which they are associated, a description of each rule, and instructions for updating each rule.

Group	Label	Description	EDI	Instructions
ADDR	DFLTADDRSRCE	Default Address Source	N	Update the Default Address Source to the value from the Address Source Validation Form (STVASRC) that you want assigned to addresses loaded from EDI applications. (You may need to build the desired value on STVASRC first.)
ADMS	DFLTASRCEDI	EDI Default Application Source	Y	Update the EDI Default Application Source to the value from the EDI Application Source Code Validation Form (STVAPLS) that you want assigned to electronic applications received via EDI.
ADMS	DFLTSBGIEDI	EDI Default Application SBGI Source	Y	Insert the source STVSBGI value into the Application Source Table (SARRSRC).
ADMS	DUPLAPPLCURR (Not currently used in Banner Student Self-Service Admissions processing.)	Allow Dup App for Curriculum	N	Update the value to Y (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and curriculum. Update the value to N (unchecked) if no duplicate checking should be done.

Group	Label	Description	EDI	Instructions
ADMS	DUPLAPPLLEVEL	Allow Dup App for Level	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and level. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLMAJR	Allow Dup App for Major	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term and major. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLPERS	Allow Dup App for Person	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same person, regardless of the term, level, curriculum, or major specified. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	DUPLAPPLTERM	Allow Dup App for Term	N	Update the value to <i>Y</i> (checked) to specify that self-service admissions should perform duplicate checking using the duplicate rules set up on SAAECRL for the given application type for the same term, regardless of the level, curriculum, or major specified. Update the value to <i>N</i> (unchecked) if no duplicate checking should be done.
ADMS	EDIIDPREFIX	Generated ID Prefix for Upload	Y	Enter the letter for the first character of the ID that TS 189 processing generates for use on the Electronic Application Process Form (SAAEAPS).

Group	Label	Description	EDI	Instructions
ADMS	EDIWAPPCODE	WAPP Code for TS 189 Upload Pgm	Y	Specify the code of the electronic application type to be used when loading EDI applications, so the procedures and routines (rules) will be attached. Must be validated on the Application Type Code Validation Form (STVWAPP).
ADMS	EMAILTYPE	Store default e-mails	N	Enter a value from the E-mail Address Type Validation Form (GTVEMAL).
ADMS	FORRESIDCODE	Out of Country Residency Code	N	Update the Out of Country Residency Code to the value from the Residence Code Validation Form (STVRESO) that you want assigned to an application if the verification procedures determine that the person is an out-of-country resident. (See Note 1 below.)
ADMS	INRESIDCODE	In State/Prov Residency Code	N	Update the In State/Province Residency Code to the value from the Residence Code Validation Form (STVRESO) that you want assigned to an application if the verification procedures determine that the person is an in-state/province resident. (See Note 1 below.)
ADMS	OUTRESIDCODE	Out of State/Prov Residency Code	N	Update the Out of State/Province Residency Code to the value from the Residence Code Validation Form (STVRESO) that you want assigned to an application if the verification procedures determine that the person is an out-of-state/province resident. (See Note 1 below.)

**Note:** 1. Residency determination is made based on answers to a variety of questions. If the system cannot determine residency, or if no residency codes are specified in these three rules, the default Residency Code, identified by the value for the label *DFLTRESO* in the group *RESO* will be used.

Group	Label	Description	EDI	Instructions
ATYP	DFLTPARENTATYP	Default Parent Address Type	N	Update the Default Parent Address Type to the value from the Address Type Code Validation Form (STVATYP) that you want assigned to addresses created from parent address information. (See Note 2 below.)
ATYP	DFLTSTUDENTATYP	Default Student Address Type	N	Update the Default Student Address Type to the value from the Address Type Code Validation Form (STVATYP) that you want assigned to addresses created from applicant address information. (See Note 2 below.)

**Note:** 2. Addresses submitted via EDI may have a location qualifier which identifies the type of address. Default address types defined under group *ATYP* are defaults which are used *only* when the address type to be assigned cannot be determined based upon other information.

CQLF	ACTVCQLFCODE	Default Activity Qlfr Code	Y	The Default Activity Qualifier Code is an EDI value, and it is delivered as <i>SA</i> . Specifically, it is used to distinguish between activities and awards which may be reported in the same EDI data segment. This value also has to be assigned to those values which are “student activities” in the EDI Cross-Reference Rules Form (SOAXREF) for rules with a label of <i>STVINTS</i> .
CQLF	AWRDCQLFCODE	Default Award Qualifier Code	Y	The Default Award Qualifier Code is an EDI value, and it is delivered as <i>SB</i> . Specifically, it is used to distinguish between activities and awards which may be reported in the same EDI data segment. This value also has to be assigned to those values which are “student awards” in the EDI Cross-Reference Rules Form (SOAXREF) for rules with a label of <i>STVINTS</i> .

Group	Label	Description	EDI	Instructions
CURR	DFLTCAMPCODE	Default Campus Code Value	N	Update the Default Campus Code Value to the value from the Campus Code Validation Form (STVCAMP) that you want assigned to an application if the application's campus cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTCOLLCODE	Default College Code Value	N	Update the Default College Code Value to the value from the College Code Validation Form (STVCOLL) that you want assigned to an application if the application's college cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTDEGCCODE	Default Degree Code Value	N	Update the Default Degree Code Value to the value from the Degree Code Validation Form (STVDEGC) that you want assigned to an application if the application's degree cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTDEPTCODE	Default Department Code Value	N	Update the Default Department Code Value to the value from the Department Code Validation Form (STVDEPT) that you want assigned to an application if the application's department cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).

Group	Label	Description	EDI	Instructions
CURR	DFLTMAJRCODE	Default Major Code Value	N	Update the Default Major Code Value to the value from the Major, Minor, Concentration Code Validation Form (STVMAJR) that you want assigned to an application if the application's major cannot be correctly derived by data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR).
CURR	DFLTMAJRQLFR	Default Major Code Qualifier	Y	<p>The Default Major Code Qualifier is an EDI value, and it is delivered as <i>8I</i>, for CIP code. Specifically, the Default Major Code Qualifier is used by the script <code>xrefmajr.sql</code> delivered to assist in building major code cross-reference values in the EDI Cross-Reference Rules Form (SOAXREF). This script copies each value in the Major, Minor, Concentration Code Validation Table (STVMAJR) which has a value in the <b>CIPC</b> field and creates a rule in the EDI Cross-Reference Rules Table using the major code, CIPC code, and EDI qualifier specified here.</p> <p>If the values entered in the <b>CIPC</b> field on STVMAJR are not Classification of Instructional Program (CIP) codes, the correct EDI value for the code set used for this field should be entered for this rule.</p> <p>(See Note 3 below.)</p>

**Note:** 3. The value for this rule is used *only* by the script used to populate major code values in SOAXREF. If you are not using the script and are instead building appropriate major code translation values by hand, this rule will not be used.

Group	Label	Description	EDI	Instructions
CURR	USEDEFAULTS	Use Default Curriculum Values	N	Update the value to checked(set to <i>Y</i> ) or unchecked(set to <i>N</i> ) to specify whether the campus, college, department, degree, and major defaults should be used when an application is created. (See Note 4 below.)

**Note:** 4. Default values are used when the appropriate value cannot be determined using data viewed in the EDI Cross-Reference Curriculum Rules Form (SOAXCUR) or maintained in the Curriculum Rules Form (SOACURR). For example:

A single set of EDI cross-reference values can be associated with more than one curriculum rule. If the same EDI cross-reference values are assigned to more than one curriculum rule, the defaults are used as “tie-breakers” and assigned to all associated fields.

Regardless of the data elements used when the Banner application is created, curriculum rule checking takes place according to normal rules when the application data is viewed on any Banner form. If the values loaded for the application represent an invalid curriculum choice, as defined by existing curriculum rules, an error message is displayed and corrective action may be required at that time.

DTQL	AWRDDTQLCODE	Award Date	Y	The Award Date Qualifier rule specifies the Date/Time Qualifier used to specify an award date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
DTQL	EFFCDTQLCODE	Effective Date	Y	The Effective Date Qualifier rule specifies the Date/Time Qualifier used to specify an effective date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
DTQL	ENDDTQLCODE	End Date	Y	The End Date Qualifier rule specifies the Date/Time Qualifier used to specify an end date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.

Group	Label	Description	EDI	Instructions
DTQL	EXPRDTQLCODE	Expire Date Qualifier	Y	The Expire Date Qualifier rule specifies the Date/Time Qualifier used to specify an expiration date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
DTQL	ISSUDTQLCODE	Issue Date Qualifier	Y	The Issue Date Qualifier rule specifies the Date/Time Qualifier used to specify an issue date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
DTQL	STRTDTQLCODE	Start Date	Y	The Start Date Qualifier rule specifies the Date/Time Qualifier used to specify a start date. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
ENTY	HSCHEPTYCODE	Default High School Entity	Y	The Default High School Entity rule specifies the EDI qualifier which represents a high school. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
FLVL	MJRFLVLCODE	Major Field of Study Level	Y	The Major Field of Study rule specifies the EDI field of study qualifier used to represent majors. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
FLVL	MNRFLVLCODE	Minor Field of Study Level	Y	The Minor Field of Study rule specifies the EDI field of study qualifier used to represent minors. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
LGCY	FATHERLGCYCODE	Father Legacy Code	N	Update the Father Legacy Code to the value from the Legacy Code Validation Form (STVLGCY) that describes an applicant's father (alone) as a legacy relationship.

Group	Label	Description	EDI	Instructions
LGCY	MOTHERLGCYCODE	Mother Legacy Code	N	Update the Mother Legacy Code to the value from the Legacy Code Validation Form (STVLGCY) that describes an applicant's mother (alone) as a legacy relationship.
LGCY	PARENTLGCYCODE	Parents Legacy Code	N	Update the Parents Legacy Code to the value from the Legacy Code Validation Form (STVLGCY) that describes an applicant's parents (both mother and father) as legacy relationships.
PCOL	DFLTPCOLQLFR	Prior College Qualifier Dflt	Y	Update the Prior College Qualifier Default to the EDI qualifier for the code set which represents values entered in the <b>FICE</b> field of the Source/Background Institution Code Validation Form (STVSBGI). It is used only by the scripts <code>xrefsbgih.sql</code> and <code>xrefsbgic.sql</code> , delivered to assist in building high school and college cross-reference values in the EDI Cross-Reference Rules Form (SOAXREF). (See Note 5 below.)
<p><b>Note:</b> 5. This script copies all values from the Source/Background Institution Code Validation Table (STVSBGI) which have a type of <i>C</i> (college) or <i>H</i> (high school) and have a value in the <b>FICE</b> field. When these conditions are met, the scripts create rules in the EDI Cross-Reference Rules Table using the SBGI Code, <b>FICE</b> field value, EDI qualifier specified here, and a description which may include school name, city, state/province, and nation, depending upon options selected when the script is run.</p>				
PCOL	PCOLDFLTDEGC	Prior College Default Degree	N	Update the Prior College Default Degree rule to the Banner degree code from the Degree Code Validation Form (STVDEGC) which should be assigned as the prior college degree attempted if an applicant does not supply a value.

Group	Label	Description	EDI	Instructions
PQLF	EMAILPQLFCODE	Phone Qualifier for E-mail	Y	<p>The Phone Qualifier for E-mail rule specifies the EDI standard telephone qualifier which identifies an e-mail address.</p> <p><b>Note:</b> The delivered value for this rule is <i>EM</i>; however, if the same value has been defined for another email address and/or telephone type (such as <i>Emergency</i>), then it is recommended that this value be changed.</p>
QSTN	CONFQSTNCODE	Restrict Access Indicator	Y	<p>The Restrict Access Indicator rule specifies the EDI question code which reports whether the applicant requests that information be restricted or kept confidential. It is an EDI standard value which should <i>not</i> be changed.</p>
QSTN	FALMQSTNCODE	Legacy Information Response	Y	<p>The Legacy Information Response rule specifies the EDI question code which reports whether the applicant's relative is an alumnus of the applied-to institution. It is an EDI standard value which should <i>not</i> be changed.</p>
QSTN	FDCSDQSTNCODE	Father Deceased Request Code	Y	<p>The Father is Deceased Request Code rule specifies the EDI question code which reports whether the applicant's father is deceased. It is an EDI standard value which should <i>not</i> be changed.</p>
QSTN	MALMQSTNCODE	Mother is Alumni Request Code	Y	<p>The Mother is Alumni Request Code rule specifies the EDI question code which reports whether the applicant's mother is an alumnus of the applied-to institution. It is an EDI standard value which should <i>not</i> be changed.</p>
QSTN	MDCSDQSTNCODE	Mother Deceased Request Code	Y	<p>The Mother is Deceased Request Code rule specifies the EDI question code which reports whether the applicant's mother is deceased. It is an EDI standard value which should <i>not</i> be changed.</p>

Group	Label	Description	EDI	Instructions
QSTN	RESDQSTNCODE	Resident of State/Prov Request	Y	The Resident of State/Province Request rule specifies the EDI question code which reports whether the applicant claims to be a resident of the applied-to institution's state or province. It is an EDI standard value which should <i>not</i> be changed.
RES D	DFLTRESDCODE	Default Residency Code	N	Update the Default Residency Code rule to the code from the Residence Code Validation Form (STVRES D) which should be assigned to an applicant if a specific residence status cannot be determined based upon other information.
RES D	HOMECOUNTY	Institution's Home County	N	Update the Institution's Home County rule to the code from the County Code Validation Form (STVCNTY) which represents the institution's home county. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.
RES D	HOMENATION	Institution's Home Country	N	Update the Institution's Home Nation rule to the code from the Nation Code Validation Form (STVNATN) which represents the institution's home nation. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.
RES D	HOMESTATPROV	Institution's Home State/Prov	N	Update the Institution's Home State/Province rule to the code from the State/Province Code Validation Form (STVSTAT) which represents the institution's home state. This value is used, in conjunction with other information, to attempt to determine the residency status to assign to an applicant.

Group	Label	Description	EDI	Instructions
RFQL	SSNRFQLCODE	SSN Qualifier	Y	The SSN Qualifier rule reports the EDI Reference Qualifier Code used to describe Social Security/Social Insurance number. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
RFQL	VISARFQLCODE	VISA Reference Qualifier	Y	The Visa Reference Qualifier rule reports the EDI Reference Qualifier Code used to describe visa type. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
RFQL	VNUMRFQLCODE	VISA Number Reference Qlfr	Y	The Visa Number Reference Qualifier rule reports the EDI Reference Qualifier Code used to describe visa number. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
RLTN	FATHERRLTNCODE	Relationship Qualifier; Father	Y	The Father Relationship Qualifier rule specifies the EDI qualifier code which represents the father of the applicant. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
RLTN	MOTHERRLTNCODE	Relationship Qualifier; Mother	Y	The Mother Relationship Qualifier rule specifies the EDI qualifier code which represents the mother of the applicant. It is an EDI standard value which should <i>not</i> be changed or unpredictable results will occur.
TELE	AREALENGTH	Area Code Length	Y	The Area Code Length rule is used to specify the expected standard length of area codes reported as part of telephone information. It should be set to the standard length for area codes normally reported to your institution.

Group	Label	Description	EDI	Instructions
TELE	PHONELENGTH	Phone Number Length	Y	The Phone Number Length rule is used to specify the expected standard length of phone numbers reported as part of telephone information. It should be set to the standard length for telephone numbers normally reported to your institution.
VCRL	AUTOOVERRIDE	Automatic Override Indicator	N	The Automatic Override Indicator rule is used to specify whether verification procedures and routines which allow overrides (as defined on the Electronic Admissions Procedure/Routine Control Form (SAAECRL) will be automatically overridden. Update this rule to checked(set to <i>Y</i> ) or unchecked(set to <i>N</i> ) depending upon your choice. Overriding a procedure or routine will not cause invalid data to be loaded; it merely reduces the number of manual overrides you may need to perform during electronic application verification.

## Cross-Reference Labels Used in EDI Processing

EDI cross-reference rules are identified by a label. The label describes the purpose of the cross-reference rule. The following is a list of all the labels on SOAXREF that are used in EDI processing.

Label	Description	Processing Notes
AGEVERIFY	Age Verification Codes	Age Verification Codes are used to report the source of age verification data. They are used only in TS 189 processing.
CRDBASIS	Credit Basis Codes	Credit Basis Codes are used only to process TS 189 data.

Label	Description	Processing Notes
DEGRLEVL	Degree Level Codes	Degree Level Codes are used to describe the generic level of a degree, and the EDI values delivered roughly correspond to the values in the Degree Award Category Code Validation Form (STVACAT). These values are used only when defining the EDI Curriculum Cross-Reference Rules. Update the Banner value to the corresponding value from STVACAT. (The Banner value will normally be the EDI value <i>without</i> the period.) Do not check (set to <i>Y</i> ) the <b>Web (Indicator)</b> on SOAXREF, as these values are not used to control Web pull-down lists, but only to define valid cross-reference values for building curriculum cross-reference rules.
DFMTCODE	Date Format Codes	Date Format Codes are used only to process TS 189 data.
EIDNCODE	Entity Identifier Codes	Entity Identifier Codes are used only to process TS 189 data.
FSTYIDQL	Field of Study Qualifier Codes	Field of Study Qualifier Codes are used only to specify the code set which is used to describe field of study choices.
FSTYLEVL	Field of Study Level Codes	Field of Study Level Codes are used only to process TS 189 data.
GENDER	Gender Codes	Gender Codes are used to define the Banner equivalent for EDI gender values. Three values are delivered.
GRCRLEVL	Grade or Course Level Codes	Grade or Course Level Codes are used only to process TS 189 data.
HONRLEVL	Honor Level Codes	Honor Level Codes are used only to process TS 189 data.
HSCRSON	High School Graduation Codes	High School Graduation Codes are used only to process TS 189 data.
IMMZRTYP	Immunization Report Type Codes	Immunization Report Type Codes are used only to process TS 189 data.
IMMZSTAT	Immunization Status Codes	Immunization Status Codes are used only to process TS 189 data.
IMMZTYPE	Immunization Type Codes	Immunization Type Codes are used only to process TS 189 data.
ITCCLEVL	Individual Level Codes	Individual Level Codes are used only to process TS 189 data.

Label	Description	Processing Notes
LANGPROF	Language Proficiency Codes	Language Proficiency Codes are used only to process TS 189 data.
LANGUSE	Language Use Codes	Language Use Codes are used only to process TS 189 data.
NTYPCODE	Name Type Codes	Name Type Codes are used only to process TS 189 data.
QSTNCODE	EDI Question Codes	EDI Question Codes are used to process TS 189 data. The question code used corresponds to the answer being provided on the TS 189 RSQ segment.
RESDCRIT	Residency Criteria Codes	Residency Criteria Codes are used only to process TS 189 data.
RFNOQLFR	Reference Qualifier Code	Reference Qualifier Codes identify a variety of reference number qualifiers used in the TS 189 transaction set. Delivered values are valid and should not be changed unless additional reference number qualifiers are added for use with the TS 189 code set. Several reference number qualifiers are used in the Electronic Admissions Application Rules Form (SAAERUL).
SBGIQLFR	Educational Inst Qualifier	Values in the Educational Institution Qualifier label are used as the qualifier in cross-reference rules for the labels <i>STVSBGIH</i> and <i>STVSBGIC</i> (high schools and colleges) to identify the code set for the values placed in the <b>EDI Value</b> field. These values are used to translate school code types and school codes into appropriate Banner values.
STVATYP	Address Type Codes	Values in the Address Type Codes label are used to translate address data received in TS 189 code sets into valid Banner address types from STVATYP.
STVCITZ	Citizenship Type Codes	Values in the Citizenship Type Code label are used to translate EDI citizenship types into appropriate Banner values.

Label	Description	Processing Notes
STVDEGC	Degree Level-Degree Code	Values in the Degree Level-Degree Codes label are used to translate EDI degree level codes into valid Banner degree codes found in the Degree Code Validation Form (STVDEGC). These values are used only in translating prior college degrees to Banner degrees. In TS 189 processing, only EDI Degree Level Codes will be transmitted. EDI Degree Level codes represent generic degree levels, (for example, Baccalaureate Degree instead of Bachelor of Arts and Bachelor of Science). To translate EDI values to Banner values, you will need generic degree codes in STVDEGC.
STVETHN	EDI Ethnic Codes	Values in the EDI Ethnic Code label are used to translate EDI ethnic codes into appropriate Banner values. (See Notes below.)
<p><b>Note:</b> You may translate a number of valid Banner codes to a single EDI code (for example; “Hopi”, “Navaho”, and “Cherokee” are all valid ethnic codes for your institution, and you map them all to the single EDI value <i>American Indian or Alaskan Native</i>).</p>		
<p><b>Note:</b> The script <code>xrefethn.sql</code> is used to populate the STVETHN label rows with values from the Ethnic Code Validation Form.</p>		
STVINTS	Award and Activity Codes	Values in the Award and Activity Codes label are used to translate EDI award and activity codes into appropriate Banner interest codes. (See Note below.)
<p><b>Note:</b> For rules which represent student awards, set the EDI Qualifier to <i>SB</i>. Awards can also be reported through the Web, but whether reported through a Web application or a TS 189 transaction set, these values will not be loaded into the permanent Banner application tables.</p>		
STVLANGN	Language Name Codes	Values in the Language Name Codes label are used to translate EDI language codes into appropriate Banner language codes.
STVLANGW	Written Language Codes	Values in the Written Language Codes label are used to translate EDI written language codes into appropriate Banner language codes.

Label	Description	Processing Notes
STVMAJR	Major Codes	Values in the Major Codes label are used to translate EDI field of study data into Banner major codes. Field of Study data reported in TS 189 transaction sets includes a qualifier code and value. Qualifier codes represent different standard code sets, like Classification of Instructional Program (CIP) codes or Stats Canada codes. You use a combination of a Degree Level code (label DEGRLEVL), Code Set Qualifier, and Banner code to define the cross-reference from EDI values to Banner values on the Curriculum Rules Form (SOACURR). To create rules for the STVMAJR label, enter the Qualifier which represents a valid EDI field of study code set, a value from the indicated set, and the Banner equivalent for the EDI value. (See Note below.)

**Note:** The script `xrefmajr.sql` is used to populate the STVMAJR label rows with values from the Major, Minor, Concentration Code Validation Form (STVMAJR).

STVMEDI	Medical Condition Codes	Values in the Medical Conditions Codes label are used to translate EDI medical condition codes into appropriate Banner medical codes.
STVMRTL	Marital Status Codes	Values in the Marital Status Codes label are used to translate EDI marital status codes into appropriate Banner codes.
STVNATN	EDI Nation Codes	Values in the Nation Codes label are used to translate EDI nation codes into appropriate Banner codes. (See Note below.)

**Note:** The script `xrefnatn.sql` is used to populate the STVNATN label rows with values from the Nation Code Validation Form.

STVRELG	Religion Codes	Values in the Religion Codes label are used to translate EDI religion codes into appropriate Banner codes. (See Note below.)
---------	----------------	--

**Note:** There may be a number of EDI religion codes which map to the same Banner value. (For example, you may have different religion codes for each of the Lutheran Synods for which there are EDI religion codes.)

STVRELT	Relationship Codes	Values in the Relationship Codes label are used to translate EDI relationship codes into appropriate Banner codes. (See Note below.)
---------	--------------------	--

**Note:** There may be a number of EDI relationship codes which map to the same Banner value. (For example, you may have different relationship codes for son, daughter, adopted child, foster child, etc., for which there are EDI relationship codes.)

Label	Description	Processing Notes
STVSBGIC	EDI College Codes	Values in the EDI College Codes label are used to translate EDI college codes into appropriate Banner codes. (See Note below.)
<b>Note:</b> The scripts <code>xrefcol1.sql</code> and <code>xrefcol2.sql</code> are used to populate the STVSBGIC label rows with values from the Source/Background Institution Code Validation Form.		
STVSBGIH	EDI High School Codes	Values in the EDI High School Codes label are used to translate EDI high school codes into appropriate Banner codes. (See Note below.)
<b>Note:</b> The scripts <code>xrefhsch.sql</code> and <code>xrefhsc2.sql</code> are used to populate the STVSBGIC label rows with values from the Source/Background Institution Code Validation Form.		
STVSTAT	EDI State Codes	Values in the State Codes label are used to translate EDI state/province codes into appropriate Banner codes. (See Note below.)
<b>Note:</b> The script <code>xrefstat.sql</code> is used to populate the STVSTAT label rows with values from the State/Province Code Validation Form.		
STVTELE	Telephone Qualifier Codes	Values in the Telephone Qualifier Codes label are used to specify the EDI telephone code which corresponds to each Banner telephone type code.
STVTESC	Sub-Test Codes	Values in the Sub-Test Codes label are used to translate EDI sub-test codes into appropriate Banner codes.
STVVVYP	VISA Type Codes	Values in the Visa Type Codes label are used to translate EDI visa type codes into appropriate Banner codes.
TESTCODE	EDI Test Qualifier Codes	Values in the EDI Test Qualifier Codes label are used to define valid EDI Test Qualifier Codes. Only codes defined as valid in this label should be used as EDI qualifiers in the STVTESC label.

## Receiving EDI Applications (to Temporary Tables)

The EDI.Smart PC application has received an admissions application and is ready for upload to the host. The process on EDI.Smart that accomplishes this upload is called `FLATUPLD`. It produces a file known as `MAP_UPLD.TXT` which can be found in the `INTFCE` subdirectory below the EDI.Smart root directory (usually `WEDISMT`). This file must be moved (copied) to a destination on the host where Banner resides which the user specifies. It may be necessary to consult with the technical staff at your institution to specify the location and name of the data file with the syntax that is appropriate for your operating system.

The file is then parsed by the PRO\*C program SAR189U (TS 189 Upload to Banner). The SAR189U process can be run from job submission.

The parameters are as follows:

- *Input File* (Required) - Enter the directory path where MAP\_UPLD.TXT file is located.
- *Test Flag* (Optional) - Enter *Y* to produce more extensive messages in the log file. Enter *N* to not print the debug messages.
- *Application Type* (Optional) - Enter the application type code to be associated with EDI applications. Valid values come from the Application Type Code Validation Form (STVWAPP).
- *Term Code* (Optional) - Enter the term code to be used as entry term for EDI applications. Valid values come from the Term Code Validation Form (STVTERM).

The SAR189U process scans the flat file (map\_upld.txt) and puts the data into the same Oracle holding tables that are used for self-service admissions application processing. You can review the TS 189 application from within Banner on the Electronic Application Process Form (SAAEAPS), as well as on the Electronic Application Submitted Form (SAAETBL).

## Processing EDI Applications

If you have completed all of the steps outlined in the Admissions Application Set-Up Procedures for EDI applications, Banner is now ready to receive admissions applications via EDI.

Before you receive your first EDI application, you need to establish appropriate policies and procedures for processing EDI applications. For example, you need to determine whether to weed out frivolous applications, when and how you will collect application fees (if required), whether you require and how you will collect application certifications and signatures, and what impact EDI applications will have on application and yield statistics.

The Elec. App. Verify/Load Process (SARETMT) is a batch process that is used to match, verify, and load admissions applications received via EDI. This process allows users to match, verify, and load large numbers of EDI applications at one time. The process uses the same matching algorithm as the Electronic Prospect Match Process (SRRSRIN) and the Common Matching Entry Form (GOAMTCH). The Electronic Application Process Form (SAAEAPS) is used to process EDI applications that are placed in suspense or error status by the SARETMT batch load process. In addition, SAAEAPS can be used to review EDI applications and delete those that are most likely frivolous (i.e., applications from Mickey Mouse or Claude Monet).

## Overall Process

The overall process for receiving EDI admissions applications is as follows.

1. The application is received and loaded to the temporary tables using EDI.Smart and SAR189U.
2. The institution reviews all EDI applications (via SAAEAPS) added on a specific date that are complete to check for frivolous applications. (Optional)
3. The institution runs the SARETMT process to match, verify, and load Web applications.
4. The institution reviews EDI applications on SAAEAPS that were put into Suspense or Error status by the SARETMT process.
5. Suspended records are resolved on SAAEAPS using GOAMTCH to determine if the applicant is New or is a Match to an existing Banner record.
6. The institution reruns SARETMT to verify and load those applications whose suspense status has just been resolved. Depending on the number of suspended records, the institution can choose to manually verify and load these EDI applications on SAAEAPS.

## Detailed Steps

The detailed steps for receiving EDI admissions applications are discussed in this section.

1. Use the Electronic Application Process Form (SAAEAPS) to display received EDI applications.

To display the application(s) for a specific person, enter the electronic ID for that person in the Key Block or use a List function to display the Electronic Applicant Search Form (SOAEIDN), where you can search for an electronic applicant using name and ID. You can also select only those applications added on a certain date by entering the **Add Date** in the Key Block field. Only applications matching the **Web ID** and/or **Add Date** in the Key Block will be displayed.

You can also enter the main block and query on certain fields. Those fields are: **Application Number, Application Type, Completion Indicator, Term, Source (with a value of EDI), Add Date, Accepted Indicator, Process, Process Date, Person Status, and Application Status.**

If you find applications that you believe are frivolous, they can be deleted using the Delete Record function. Once an application is deleted on SAAEAPS, its associated data is also deleted from the electronic application holding tables; therefore, the application will no longer be viewable on SAAETBL.

2. Use the Elec. Appl. Verify/Load Process (SARETMT) to match, verify, and load the EDI applications that meet your processing guidelines.

Parameters for SARETMT allow processing based upon Application Type, Application Source, Application Term, and the Date Range of when applications were added.

- 2.1. Run SARETMT in audit mode.

SARETMT can be run in audit mode providing the user with the opportunity to review the match, verify, and load status of each application before it is actually processed. The Status field will indicate whether the Web application is New, Matched, Suspended, or in Error based on the matching rules specified by the matching source code assigned to the interface code on STVINFC. The process will indicate if verification errors occurred or if the application was pushed.

- 2.2. Run SARETMT in update mode.

The user can run the match, verify, and load process in update mode. All electronic applications matching the input parameters will be processed by SARETMT.

Three possible outcomes can exist for each record processed by SARETMT.

- The record was matched, verified, and pushed successfully resulting in the creation of a SAAADMS application record.
- The record was placed into suspense or error status during the match process. Suspended records will not be processed further by SARETMT until the match status has been resolved to either New or Matched. The user can resolve the suspended status using the Electronic Application Process Form (SAAEAPS) (See the “Resolve Suspended Electronic Applications” section below for details.)
- The record failed the verification process. Numerous verification routines exist to ensure the integrity of the data being loaded into Banner. If certain errors occur during the verification process, the record will be marked with a verification error.

3. Resolve suspended electronic applications using the Electronic Application Process Form (SAAEAPS).

- 3.1. Access the Electronic Application Process Form (SAAEAPS).

- 3.2. Navigate to the main block and query for the appropriate records (i.e., term, source equals EDI etc.) having a Person Status of S. These are the records that will need to be resolved before they can be verified and pushed into Banner.

4. Select the Verification Steps tab or the Manual Verification Steps option from the Options Menu to access the Verification Steps window.

5. Mark any of the person or application steps complete, except for the ID Verification (*IDVR*) step, and then save the changes.
6. Select the ID Verification (*IDVR*) step, and then choose the Associate Person with ID item from the Options Menu.
7. This opens the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record from the **Select an ID** field.
  - **Electronic ID** – This is the ID used to create the electronic application.
  - **Local ID** – This is used for applications filed via EDI where the applicant provided a Local ID.
  - **SSN** – This is the SSN or other Federal ID number specified on the electronic application.
  - **Banner ID** – This is used if you wish to enter an explicit ID to be used by Banner.
  - **Generate ID** – This indicates that Banner should generate an ID for this person.
8. After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display GOAMTCH.
9. The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.

10. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
11. Once the data has been "cleaned up", use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
12. The incoming electronic application can be a match, a potential match, or a new record:
  - 12.1. If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.

- 15.4. Scroll through each procedure to find the procedures that have not been verified (i.e., the **Completion Indicator** checkbox is *not* checked). To resolve a procedure or routine, check the appropriate override (**Override Indicator**) box. If you override an individual routine, only the verification associated with that routine will be bypassed. If an entire procedure is overridden, none of the individual routines will have verification performed.
- 15.5. Once all routines and/or procedures are overridden, return to the main block of SAAEAPS. You can manually re-verify the application here by selecting Verify Application from the Options Menu, or you can re-run SARETMT.
16. Re-run SARETMT in update mode.

SARETMT will try to verify all records that were previously suspended and will attempt to re-verify all applications that originally failed verification. All applications that pass the match and verification processing will be pushed to Banner. Once an application has been pushed, the **Process** field will be set to *P*(ushed).

## Manually Matching, Verifying, and Pushing Electronic Applications

The following steps show how to manually match, verify, and push electronic applications into Banner using SAAEAPS.

1. Use the Electronic Application Process Form (SAAEAPS) to display received EDI applications.

To display the application(s) for a specific person, enter the electronic ID for that person in the Key Block or use a List function to display the Electronic Applicant Search Form (SOAEIDN), where you can search for an electronic applicant using name and ID.

You can also select only those applications added on a certain date by entering the **Add Date** in the Key Block field. Only applications matching the **Web ID** and/or **Add Date** in the Key Block will be displayed.

You can also enter the main block and query on certain fields. Those fields are: **Application Number, Application Type, Completion Indicator, Term, Source (with a value of EDI), Add Date, Accepted Indicator, Process, Process Date, Person Status, and Application Status.**

If you find applications that you believe are frivolous, they can be deleted using the Delete Record function. Once an application is deleted on SAAEAPS, its associated data is also deleted from the electronic application holding tables; therefore, the application will no longer be viewable on SAAETBL.

2. Flag applications for further processing.

If you will not process an application until a fee or certification is received, you might also want to set the **Accepted Indicator** to *N* until you receive the appropriate additional information required by your policies and procedures.

For those applications which you will further process, set this indicator to *Y*.

3. Perform any required manual verification steps.

Select the Verification Steps tab, use a Duplicate Item function, or select Manual Verification Steps from the Options Menu to transfer to the Verification Steps window. There may be two kinds of manual verification steps, those related to person data and those related to an application. You defined the manual verification steps which would be required on the Application Verification Steps Validation Form (STVASTA). One person-related step - ID Verification (*IDVR*) - is required by system processing and will be present whether or not you defined additional verification steps.

You must now either match the EDI applicant to an existing Banner person or create the person in Banner. Either of these functions also completes the ID Verification (*IDVR*) step. Continue with Step 3 through Step 10.

When you are positioned on the ID Verification (*IDVR*) step record, use a function key to perform special processing. The function can be performed if the ID Verification (*IDVR*) step has already been completed.

Use a Count Query Hits function or select Associate Person with ID from the Options Menu to transfer to the Associate Person with ID window, where you can choose which type of Banner ID to assign to the selected record in the **Select an ID** field.

- **Electronic ID** – This is the ID used to create the electronic application.
- **Local ID** – Used for applications filed via EDI where the applicant provided a Local ID.
- **SSN** – This is the SSN or other Federal ID number specified on the electronic application.
- **Banner ID** – Used if you wish to enter an explicit ID to be used by Banner.
- **Generate ID** – Indicates that Banner should generate an ID for this person.

4. After choosing the appropriate ID type, either save the changes or select the **Associate Person with an ID** button. This will display GOAMTCH.

5. The ID displayed on GOAMTCH should match the option chosen in the Associate Person with ID window. The **Matching Source** field should contain the source code that has been assigned to the interface code on SAAWADF for the application type of the selected Web application. This source code can be changed if desired.

If no interface code has been specified for the application type on SAAWADF, then the **Matching Source** field will contain the default source code assigned to the user ID

on GORCMUS. If no default source code has been assigned on GORCMUS, you will be able to select a source code from the List of Values.

Perform a Next Block to populate the Data Entry block with all of the data for the incoming electronic applicant record that is present in the temporary tables.

6. You can update or adjust the data in the Data Entry block if it does not meet your institution's data standards. These updates will be copied back to the temporary tables and used when the applicant's record is created.
7. Once the data has been "cleaned up", use a Next Block function to call the matching algorithm, or select the **Duplicate Check** button.
8. The incoming electronic application can be a match, a potential match, or a new record:
  - 8.1. If the incoming electronic application is found to be a match to someone in Banner, the Banner record will be displayed in the Match block.
  - 8.2. If the incoming electronic application is found to be a potential match against more than one existing Banner record, then all of the possible matches will be displayed in the Potential Matches window.
  - 8.3. If the electronic application is found to be a new record, an Alert Box will be displayed with a message asking if you want to create the new person.
9. If the person is found to be an exact match, you can do one of three things:
  - 9.1. Match the incoming record to the Banner record but not update any null fields that exist for the person in Banner by selecting the **Select ID** button.
  - 9.2. Match the incoming record to the Banner record and choose to update any null fields that exist for the person in Banner with data on the incoming record by selecting the **Update ID** button.
  - 9.3. Choose to ignore the matched status, and create the person as new by selecting the **Create New** button.
10. After selecting one of the options above, the user will be returned to the Verification Steps window, and the ID Verification (*IDVR*) step will be marked as complete. Continue processing the electronic applicant as needed.
11. Verify the application data.

Select Verify Application from the Options Menu to verify the application data. Verification performs all verification procedures and routines attached to the application which have not been overridden.

After an application has been verified, its **Accepted Indicator** on the main window of SAAEAPS is set either to *E*, which indicates that errors were found during verification, or *V* for verification complete.

## 12. Review error, override verification, or correct data.

If errors are encountered during verification, select Review Results from the Options Menu or use a Next Block function to review the results. The Verification/Load Results window is displayed.

In the System Verification Procedures section of this window, each procedure and its associated routines are displayed, one procedure at a time. You scroll through the procedures using the scroll bar or Next and Previous Record functions, and the associated routines are displayed for each procedure. As you scroll through the procedures, you can ignore any which have already been overridden or which have passed verification. (The **Completion Indicator** checkbox is checked.)

Verification errors must be resolved before the data can be loaded into the Banner permanent tables from the holding tables. You resolve verification errors by overriding the routine which failed or by overriding the entire procedure. If you override an individual routine, only the verification associated with the individual routine will be by-passed. If you override the procedure, none of the individual routines will be performed. Only those procedures or routines for which override is allowed (defined on SAAECRL) can be overridden. If you attempt to override a procedure or routine when an override is not allowed, an error message displays, and the override is not processed.

After overriding all routines or procedures that you wish to have ignored, use the Return button to return to the main window of SAAEAPS, and select Verify Application from the Options Menu to verify the information again. Only data which had not previously been verified is processed. Procedures in which you overrode routines can now be verified.

You should continue verifying data and overriding routines and procedures until verification is complete (the **Accepted Indicator** displays *V* for Verified). When you push data into the permanent tables, data for procedures which have been verified is loaded, regardless of the status of other data.

## 13. Load the verified information into the permanent tables.

Select Load Application from the Options Menu or use an Insert Record function to push the data to the permanent tables. After you have pushed the data, you can view the results by selecting Review Results from the Options Menu or by using a Next Block function to access the System Verification Procedure section of the Verification/Load Results window. Scroll until you reach procedure P900, the PUSH Verification Procedure. The routines associated with this procedure push actual pieces of data. Data has been pushed for routines which are complete, and the message associated with each completed routine will tell you the number of records created or updated.

## Race/Ethnicity Processing

Ethnicity category and race data can be captured in Recruiting and Admissions in Banner Student. This processing ties into Banner Human Resources and Banner General. Banner Human Resources collects and reports on ethnicity, ethnic category (Hispanic or Latino and Not Hispanic or Latino), and race separately, as well as on multiple races for an individual. Banner General collects and displays the value of *RACE*.

### Prerequisites

Do the following setup before installation.

#### **Warning**

Before release 7.3 is installed, mappings for race, institutional race, and ethnic category *must* be set up in Ethnic Code Validation Form (STVEHTN), and race codes *must* be updated on the Race Rules Form (GORRACE).

In addition, if you load AMCAS files using SRTLOAD and currently have conversion rules for validation table *ETHR*, please be sure that those rules are correct. ■

The upgrade process will check STVETHN for institutional race values that are associated with ethnic codes on SOTCNVT for *ETHR* and then build new SOTCNVT rules for *RACE* using GORRACE. Incoming race values will be converted using *RACE* (GORRACE) versus using *ETHR*. The *ETHR* rules will still be valid and will be used with AMCAS processing but should be reviewed. The use of the conversion rule *ETHR* is discussed in further detail in the “Race/Ethnicity Functionality for AMCAS” topic.

When release 7.3 is installed, the SRTSUPL temporary table and the SABSUPL permanent table will be modified to accommodate three position race fields that are validated on GORRACE. If the release is installed without having these STVETHN and GORRACE rules set up, you may lose existing SOASUPL race codes in production and SRTSUPL temporary table race codes, if values that existed prior to the upgrade cannot be converted to the equivalent three digit race codes during the installation. The scripts for the conversions are run during the upgrade process when the tables and fields are changed from two digits to three digits.

#### **Note**

*Please refer to the following checklist for processing and conversion steps.* ■

## Processing Checklist

The following steps should be performed *before* installing this functionality:

1. Run the `srstvethn.sql` script, found in the Plus directory.

This script checks STVETHN to determine which ethnic codes have no equivalent race codes and are not able to be converted.

This script also checks GORRACE to determine which race codes are mapped to more than one ethnic code and are not able to be converted.

2. Update your data in STVETHN and/or GORRACE based on the results of the script.
3. If you process AMCAS files using SRTLOAD, review the SOTCNVT/*ETHR* rules to make sure they are correct.

The following steps should be performed *after* installing this functionality:

1. Review any new SOTCNVT/*RACE* rules for AMCAS processing.
2. Review SOTCNVT/*ETHR* rules for AMCAS processing.
3. Review all seed data, table changes, and database changes as needed to test the setup at your institution.
4. Run the `supsprac1.sql` and `supsprac2.sql` scripts.

The `supsprac1.sql` script copies race data in the SRTSUPL temporary table to the SRTPRAC temporary table.

The `supsprac2.sql` script copies race data in the SABSUPL permanent table to the GORPRAC permanent table.

### **Warning**

These two scripts are optional and are *not* executed during the upgrade process. You *must* run them after the upgrade is performed. ■

## Processing

Race/ethnicity processing can be tracked and is processed using the following forms and/or reports:

- SPAPERS
- SPAIDEN
- SRAQUIK
- SAAQUIK

- SRAPREL
- SRIPREL
- SOTCNVT
- SRRPREL
- SRTLOAD
- SRTPURG

SRTLOAD accommodates the incoming race fields and loads the values to the new SRTPRAC temporary repeating table. SRTLOAD still processes race for AMCAS in the current manner with regard to SRTSUPL.

The incoming race data will be converted via SOTCNVT based on RACE (GORRACE) prior to being loaded to SRTPRAC/GORPRAC. AMCAS race will also continue to be loaded to the SRTSUPL/SOASUPL/SABSUPL Race1 through Race 10 fields. Values will be loaded to the permanent tables for use with SPAIDEN, SPAPERS, SRAQUIK, and SAAQUIK. SRRPREL will load race and ethnicity (Hispanic or Latino and Not Hispanic or Latino) to the appropriate Banner tables. SRRPREL will also update the SPBPERS\_CONFIRMED\_RE\_CD and SPBPERS\_CONFIRMED\_RE\_DATE fields, when the SPBPERS\_ETHN\_CODE and GORPRAC\_RACE\_CDE values are inserted.

 **Note**

The push process that loads data does not change or overwrite data if that data already exists in Banner. Only a single value can exist for ethnicity. While multiple race values may exist, if new race values are submitted, only those values that are unique are added to GORPRAC. ■

The Prospects module in Banner Student Self-Service captures the ethnicity /ethnic category (Hispanic or Latino and Not Hispanic or Latino) and race values that are submitted online by prospects. A single ethnic category may be submitted. Multiple race codes can be submitted. After the data is submitted, it is loaded to the same temporary tables/fields (SRTPEERS for ethnicity/ethnic category and SRTPRAC for race) that are updated using SRTLOAD for incoming test score/search data. Once ethnic and race values have been loaded to the temporary tables, all the electronic prospect processing that follows mirrors tape load processing.

The Admissions module in Banner Student Self-Service captures the ethnicity/ethnic category (Hispanic or Latino and Not Hispanic or Latino) and race values that are submitted online by applicants. A single ethnic category may be submitted. Multiple race codes can be submitted. After the data is submitted, it is loaded to the temporary tables/ fields (SARPEERS for ethnicity and SARPRAC for race).

SAAETBL reflects the use of the ethnic category and race data in the temporary tables. The push process will validate the data and allow for overwrite/push of the ethnic and race data from the temporary tables to SPBPERS and GORPRAC, respectively. Also, the push process will update the SPBPERS\_CONFIRMED\_RE\_CD and the

SPBPERS\_CONFIRMED\_RE\_DATE fields when both the ethnic category and race codes are loaded to Banner, to indicate the data has been reported and confirmed directly from the applicant.

The push process will also allow an overwrite of the ethnic category and race data that exists in Banner when the routine to overwrite existing ethnic category or existing race has been added to SAAECRL by the institution for the chosen application type.

In the case of the overwrite existing ethnic category, the single existing ethnic category in SPBPERS will be overwritten by the SRAPERS ethnic category. If the overwrite is not added by the institution, when the data is loaded, it will be inserted if the value is null. If the overwrite is not added by the institution, when the data is loaded, it will not be inserted if the value is not null.

Two fields on SPAPERS are updated to indicate that the incoming race and ethnic data and the date have been confirmed. When any race or ethnicity data in the temporary table that has been reported by the individual using test scores or self-service is loaded to production through SPBPERS, then the SPBPERS\_CONFIRMED\_RE\_CD column is updated to *Y* to indicate that the data has been confirmed, and the SPBPERS\_CONFIRMED\_RE\_DATE column is updated to the date the data is pushed to Banner from SPBPERS. These two fields do not have associated temporary table fields, so these fields are updated directly in SPBPERS.

 **Note**

Historical ethnicity and race data will not be saved. Existing ethnicity data in SPBPERS will be overwritten by SRKPREL. Existing “new ethnicity” data in SPBPERS will be overwritten unless the value is NULL/None.

In the case of the overwrite existing race, all existing race codes on GORPRAC will be deleted and the SRAPRAC race codes will be inserted into GORPRAC. If the overwrite is not added by the institution, when the data is loaded, it will insert race codes if the value is null. If the overwrite is not added by the institution, when the data is loaded, it will not add or update race codes if race codes exist. ■

## Race/Ethnicity Functionality for AMCAS

AMCAS processing as of Release 7.2 used *ETHR* on SOTCNVT for the conversion of ethnicity values to race values on SABSUPL. Incoming AMCAS race values were converted to a race value from STVETHN using the conversion table value *ETHR*, since there was no existing Banner *RACE* code.

AMCAS processing as of Release 7.3 will continue to use *ETHR* on SOTCNVT, but for a different reason. When the AMCAS Hispanic Indicator is set to *N*, the value for AMCAS RACE CODE 1 is loaded to the SRTPERS\_ETHN\_CODE field. In order for RACE CODE 1 to be converted to an appropriate ethnic code, the conversion rule to convert RACE CODE 1 to an ethnicity must be valid. *ETHR* is used on SOTCNVT to change the incoming RACE CODE 1 to the SPBPERS\_ETHN\_CODE value.

AMCAS loads up to ten ethnic codes and ten race codes to SABSUPL/SOASUPL. Incoming ethnic and race codes are now different values. The value from STVETHN is used to convert ethnicity (SOTCNVT rule *ETHN*) and RACE CODE 1, (SOTCNVT rule *ETHR*), when the AMCAS Hispanic Indicator is set to *N* for the validation and conversion on SOTCNVT.

- On SOTCNVT, the incoming ethnic codes are converted and loaded to SRTSUPL and SRTPERS using the *ETHN* value from STVETHN.
- On SOTCNVT (when the AMCAS Hispanic Indicator is set to *N*), the incoming RACE CODE 1 is converted and loaded to SRTPERS using the *ETHR* value from STVETHN.

The Hispanic Indicator is loaded to SABSUPL/SOASUPL and also to SRTPERS/SPBPERS.

- The incoming Hispanic Indicator is loaded to temporary tables/fields SRTSUPL\_HISP\_IND and SRTPERS\_ETHN\_CATEGORY.
- The incoming Hispanic Indicator is loaded to permanent tables/fields SABSUPL\_HISP\_IND and SPBPERS\_ETHN\_CDE.

In summary:

- On SOTCNVT, the incoming ethnic codes are converted and loaded to SABSUPL/SOASUPL using the *ETHN* value from STVETHN. These are two character codes.
- On SOTCNVT, incoming race codes are converted and loaded to SRTSUPL/SABSUPL and SRTPRAC/GORPRAC using the *RACE* value from GORRACE. These are three character codes.
- If the incoming Hispanic Indicator is set to *Y*, ETHN CODE 1 is loaded to the SRTSUPL\_ETHNIC\_CODE\_SELF field and the SRTPERS\_ETHN\_CODE field.
- If the incoming Hispanic Indicator is set to *N*, RACE CODE 1 is loaded to the SRTSUPL\_ETHNIC\_CODE\_SELF field and the SRTPERS\_ETHN\_CODE field.  
The RACE 1 value is three characters in length and is converted from GORRACE (SOTCNVT/*RACE*).
- When the Hispanic Indicator is set to *N*, it will look at the incoming RACE CODE 1 value and convert it to ethnicity for the SRTPERS\_ETHN\_CODE field using the *ETHR* rule on SOTCNVT. *ETHR* is used to convert the incoming race values to a valid ethnic code that will be loaded to the SRTPERS\_ETHN\_CODE field.

## Using the Electronic Prospect Load (SRTLLOAD)

SRTLLOAD validates incoming race values against the conversion process using SOTCNVT/GORRACE. SRTLLOAD will continue to convert ethnic codes based on STVETHN.

SRTLOAD also converts AMCAS RACE CODE 1 to the S RTPERS\_ETHN\_CODE value when the incoming AMCAS Hispanic Indicator is set to *N* and based on the SOTCNVT rule *ETHR*.

AMCAS race values are loaded to both SRTSUPL and SRTPRAC. The race values for AMCAS will be always be the same in both tables and can be viewed on SRIPREL/ SRAPREL. Non-AMCAS race values are only loaded to SRTPRAC.

SRTLOAD updates the following fields on SRTPRAC:

Field	Data
SRTPRAC_RIDM	Temporary recruiting record RIDM
SRTPRAC_RACE_CDE	Converted race code based on SOTCNVT/ <i>RACE</i>
SRTPRAC_USER_ID	User ID that ran SRTLOAD when table was loaded
SRTPRAC_ACTIVITY_DATE	Date/timestamp loaded to temporary table

SRTLOAD updates the S RTPERS\_ETHN\_CDE with the AMCAS HISP\_IND value.

- If the AMCAS HISP\_IND value is set to *Y*, the S RTPERS\_ETHN\_CDE is set to *1*.
- If the AMCAS HISP\_IND value is set to *N*, the S RTPERS\_ETHN\_CDE is set to *2*.

The AMCAS\_HISP\_IND value will also continue to be loaded to the SRTSUPL\_HISP\_IND field.

## Purging Data

The Electronic Prospect Purge (S RTPURG) will purge data from the SRTPRAC temporary table and the S RTPERS\_ETHN\_CATEGORY column. The Electronic App Purge Process (SARETPG) will purge data from the SARPRAC table and the SARPERS\_ETHN\_CATEGORY column.

## Self-Service Race and Ethnicity Survey

You can present an optional survey to Banner Student Self-Service users to obtain ethnicity and race information for prospects and applicants. If the survey parameters have been established in Banner Web General, when a user successfully logs on to Self-Service, the survey will be presented and the user will have the option to complete the survey at that time or to complete it later. Once the user has completed the survey, it will no longer be presented to that user.

The prospect push process updates the biographical fields on SPAIDEN. The **New Ethnicity** field is updated with the ethnic category data, and the **Race** field is updated with race information. Historical data for ethnicity and race is not retained when new data is

supplied. On SPAPERS, the **Ethnicity and Race Confirmed** checkbox is checked and the **Confirmed Date** field is populated when either ethnic category or race information is supplied.

Note the following warning when setting up the Web for Prospects Selection Rules Form (SRAWPRO) and determining which Web prospect selection codes are required for use with the race and ethnicity survey. This warning also applies to setting up the Web Application Section Rules Form (SAAWAPP) and determining which Web application section codes are required for use with the race and ethnicity survey.

### **Warning**

Depending on your locale, it might be illegal to require users to provide ethnicity and race information. Do not check the **Required** checkbox on SAAWAPP for the *PERSONAL* (Personal Information) Web application section code or the **Response Required on Web** checkbox on SRAWPRO for the *ETHNICITY* (Prospect Ethnicity/Race) Web prospect selection code if requiring users to provide ethnicity and race information is prohibited.

If such a regulation applies to your institution, you must also review your existing Web application and prospect selection definitions, and uncheck these checkboxes for any application and prospect codes for which they are currently checked. ■

## Survey Questions Presentation

The presentation of the survey questions “What is your ethnicity?” and “Select one or more races to indicate what you consider yourself to be.” follows specific guidelines from the NCES. The answer choices are presented as checkboxes, instead of pulldown lists. This was done on purpose, as SunGard decided that these questions and answers should be the same for all users. The questions and answers should not be stored at the application type level where they could be customized based on the Web application types for graduates, undergraduates, and so on, on SAAWAPP. Storing the questions as information text (instead of as Web section labels from SAAWAPP) provides a unified look across Banner Self-Service between the Main Race Survey in Banner Web for General and the Web Admissions Survey in Banner Student Self-Service. The focus group for these updates reviewed the form layout and the question storage and agreed to the design. The same layout format was applied in both Banner Web for General and Banner Student Self-Service.

## AMCAS (American Medical College Application Service) Load Procedures Using SRTLOAD

### Introduction

The Electronic Prospect Load (SRTLOAD) can be used to load application data provided by the American Medical College Application Service (AMCAS) to the Banner database. This section reviews the set-up steps and procedures for loading AMCAS applications.

AMCAS application data is submitted to institutions using code values determined and published by AMCAS. These values often must be translated to appropriate, valid Banner values. Valid Banner values can be maintained as conversion rules on the Tape Code Conversion Form (SOTCNVT) or on Banner validation tables.

In addition, the AMCAS data load process requires a number of values to construct data in appropriate Banner format. Appropriate processing rules values are maintained on the Electronic Admissions Application Rules Form (SAAERUL) for the group codes *PREL*, *AGPA*, and *ACRH*.

 **Note**

It is suggested for AMCAS processing that *PREL* group code rules that are specific to AMCAS be copied to a new group code. For example, all *PREL* rules can be copied to a new group code of *AMCS* (AMCAS Rules). All rules and settings specific to AMCAS can be modified and maintained for this group code so that SAAERUL settings do not have to be changed or monitored closely when processing various tapes.

The same procedure can be followed for other file processing. For example, SRKPREL will check SAAERUL to see if the Electronic Prospect Group (STVEGRP) rule equals the Electronic Prospect Load Validation (STVPREL) rule for *AMCS* for the SAAERUL values, and if there is no *AMCS* value, it will use the SVTEGRP rule that is equal to *PREL*. ■

Both application and conversion rules (SOTCNVT) may require values established in a number of other Banner validation tables, and a number of new validation values may be required by the AMCAS load process. One-to-one matches use the validation tables. Matches that are not one-to-one use the rules on SOTCNVT.

 **Note**

AMCAS uses specific sets of nation codes and major codes which may be updated from time to time. AMCAS nation and major codes are listed in a variety of AMCAS publications and are also available on the file from AMCAS. ■

The following values are converted from the value on the incoming tape to the appropriate Banner value and loaded to the appropriate temporary tables. Not all SOTCNVT values are used by AMCAS.

Value	Description
ADMT	Used to load admissions type on SAAADMS
CAMP	Not used by AMCAS
CITZ	Not used by AMCAS
CNTY	Used to load county code

Value	Description
DEGC	Used for prior college degree (STVDEGC)
DEGA	Converts the value for APPL_TYPE on the incoming AMCAS file to an application degree on SAAADMS and overrides the degree loaded by SRTLOAD for the AMCAS Degree Code parameter (STVDEGC)
DEPT	Not used by AMCAS
EDLV	Not used by AMCAS
EGOL	Used for prior college education goals
ESEL	Used to load special consideration based on the Disadvantaged flag on the incoming AMCAS file
ETHN	Used to load ethnicity (STVETHN) to SPBPERS and SABSUPL
ETHR	Used to convert and load RACE 1 value to SABSUPL based on STVETHN when the AMCAS HISP_IND is set to N.
GNDR	Used to load gender if a conversion is necessary, but not used by AMCAS
HGPA	Not used by AMCAS
INTS	Not used by AMCAS
INTP	Not used by AMCAS
MAJR	Not used by AMCAS
MAJP	Not used by AMCAS
NATN	Used to load nation information
RACE	Used to load race (GORRACE) to GORPRAC
RELG	Not used by AMCAS
SBGI	Used to load college information
SBGH	Not used by AMCAS
STAT	Used by to load state codes
TADM	Not used by AMCAS

Value	Description
TEAC	Used to load setting of MCAT non-standard indicator from AMCAS to the test score accommodation on SOATEST/SORTEST_TEAC_CODE when test scores are loaded
TEFR	Used to load MCAT series code when test scores are loaded to the test form number on SOATEST/SORTEST_TEFR_CODE
TERM	Not used by AMCAS
TESC	Can be used by AMCAS if you do not want to load the hard-coded values
TSPT	Not used by AMCAS (Used to load test percentile for SAT, GRE)
VTYP	Used to load visa type

Two sections follow. The first section, (“AMCAS Application Load Processing Set-up”), deals with set-up steps which are required before processing the first AMCAS application file. The second section, (“AMCAS Application Load Processing and Reporting Procedures”), deals with the actual AMCAS application data load process and related steps.

## AMCAS Application Load Processing Set-up

### Note

Scripts have been delivered with the following: codes for baseline tape load AMCAS processing, values used for the conversion from SOAXREF to SOTCNVT, and SAAERUL rules for the group code *PREL*, so that very little preparation/set-up is required. It is recommended that you review the SOTCNVT conversion values and establish the necessary rules on SAAERUL. In addition, it is suggested that you review all tape load processing validation and rules forms prior to processing your first AMCAS file using baseline tape load processing procedures. ■

1. Review validation forms and build new values if required.
  - 1.1. Verify that values exist in the Degree Code Validation Form (STVDEGC) for the necessary degree types, or build new entries as needed.

If values for the degree types do not exist in STVDEGC, you will not be able to convert the AMCAS values to appropriate Banner values on the Tape Code Conversion Form (SOTCNVT).

If the values are not converted to valid Banner degree codes on SOTCNVT or exist as a one-to-one relationship in the STVDEGC validation table, the degree data reported by AMCAS will not be loaded.

- 1.2. Verify that values exist in the Degree Code Validation Form (STVDEGC) for the necessary degree types that will be used to convert the `APPL_TYPE` on the AMCAS file to the appropriate degree code for your applicant.

If values for the application degree types do not exist in STVDEGC, you will not be able to convert the AMCAS values for `APPL_TYPE` to appropriate Banner values on the Tape Code Conversion Form (SOTCNVT).

If the values for `APPL_TYPE` are not converted to valid Banner degree codes on SOTCNVT, the value for `APPL_TYPE` reported by AMCAS will not be converted or loaded as the application degree.

**Note**

On SOTCNVT for the interface tape *AMCS* (AMCAS), you *must* use the validation table name *DEGA* in order to convert the AMCAS value for `APPL_TYPE` to Banner as the application degree. Both prior college degree codes and application degree codes exist in STVDEGC, but in order for the tape load process to know which codes to convert to the prior college degree versus the application degree, it is important to use *DEGA* on SOTCNVT for the application degree.

This conversion of the AMCAS `APPL_TYPE` allows for a different degree code to be loaded for the applicant besides the one from the SRTLOAD parameter. If there is a converted value on SOTCNVT for *DEGA* for the AMCAS `APPL_TYPE`, the converted value will load first as the application degree. If there is no converted value on SOTCNVT for *DEGA*, then the required degree code listed as the SRTLOAD parameter value will be loaded as the application degree. ■

- 1.3. Verify that values exist in the Eligibility Factor Validation Form (STVESEL) for the necessary special consideration types, or build new entries as needed.

If values for these consideration types do not exist in STVESEL, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVESEL validation table, the special consideration request data reported by AMCAS will not be loaded.

- 1.4. Verify that values exist in the Educational Goal Validation Form (STVEGOL) for the necessary program types (referred to as educational goals in Banner), or build new entries as needed.

If values for these program types do not exist in STVEGOL, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVEGOL validation table, the program type data reported by AMCAS will not be loaded.

- 1.5. Verify that values exist in the Ethnic Code Validation Form (STVETHN) for the necessary *ethnic* categories, or build new entries as needed.

If values for these *ethnic* categories do not exist in STVETHN, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVETHN validation table, *ethnicity* data reported by AMCAS will not be loaded.

- 1.6. Verify that *ethnic* values also exist in the Ethnic Code Validation Form (STVETHN) for the appropriate conversion of the incoming AMCAS *race* categories, or build new entries as needed. When the AMCAS Hispanic Indicator is set to *N*, the AMCAS RACE CODE 1 value is loaded as the SPBPERS\_ETHN\_CODE. Please see the Note below.

If values for these *race* categories do not exist in STVETHN, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVETHN validation table, *race* data reported by AMCAS will not be loaded.

- 1.7. Verify that values exist in the Race Rules Form (GORRACE) and that associated race values have been entered, if necessary, on the Ethnic Code Validation Form (STVETHN) for the race codes, or build new entries as needed.

If values for these race codes do not exist in GORRACE, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVETHN validation table, race data reported by AMCAS will not be loaded.

 **Note**

On SOTCNVT, for the interface tape AMCS (AMCAS), you must use the validation table name *ETHR* in order to convert the AMCAS RACE CODE 1 to an ethnic code that will be loaded to SPBPERS when the AMCAS Hispanic Indicator is set to *N*.

When the AMCAS Hispanic Indicator is set to *N*, the RACE CODE 1 value is loaded to SPBPERS\_ETHN\_CODE and to SABSUPL. The race code is a three character value, so a corresponding ethnic code *must* be used to translate the incoming RACE CODE 1 to the appropriate Banner ethnic code.

Since ethnicity codes are converted based on values in STVETHN, in order for the tape load process to know when to convert an incoming

AMCAS ethnic code to SPBPERS\_ETHN\_CODE versus converting an incoming AMCAS RACE CODE 1 to SPBPERS\_ETHN\_CODE, it is important to use *ETHR* on SOTCNVT for the RACE CODE 1 for AMCAS.

When the AMCAS Hispanic Indicator is set to Y, the ETHNIC CODE 1 will be loaded to SPBPERS\_ETHN\_CODE, based on the appropriate *ETHN* conversion. Values for SOTCNVT/*ETHN* will be loaded to the SPBPERS\_ETHN\_CODE and SABSUPL\_ETHNIC fields based on incoming AMCAS ethnic codes.

SOTCNVT/*ETHR* will load the incoming RACE CODE 1 to the SPBPERS\_ETHN\_CODE and SABSUPL\_ETHNIC fields when the AMCAS Hispanic Indicator is set to N.

All validation for ethnicity and incoming race 1 values to ethnicity, exists in the same Banner validation table (STVETHN), but the use of validation of either *ETHN* or *ETHR* on SOTCNVT determines how these values are converted. ■

- 1.8. Verify that values exist in the Visa Type Code Validation Form (STVVVYP) for the necessary visa types, or build new entries as needed.

If values for these visa types do not exist in STVVVYP, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVVVYP validation table, the visa data reported by AMCAS will not be loaded.

- 1.9. Verify that a value exists in the Test Accommodation Validation Form (STVTEAC) for the necessary accommodation type, or build a new entry if needed.

If a value for this test accommodation type does not exist in STVTEAC, you will not be able to convert the AMCAS value to an appropriate Banner value on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVTEAC validation table, test data will be loaded, but no indication of a non-standard test administration will be populated when non-standard administration is reported by AMCAS.

- 1.10. AMCAS reports majors pursued at other institutions using specific AMCAS code values. Some majors pursued at other institutions may already be in your version of the Major, Minor, Concentration Code Validation Form (STVMAJR).

Verify that values exist in the Major, Minor, Concentration Code Validation Form (STVMAJR) for the necessary major types, or build new entries as needed

If values for AMCAS majors do not exist in STVMAJR, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If the AMCAS major codes are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVMAJR validation table, the prior college major data reported by AMCAS will not be loaded.

- 1.11.** AMCAS reports nations using specific AMCAS codes. Verify that values exist in the Nation Code Validation Form (STVNATN) for the necessary nation codes, or build new entries as needed.

If values for AMCAS nation codes do not exist in STVNATN, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If AMCAS nation codes are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVNATN validation table, the nation data reported by AMCAS will not be loaded.

- 1.12.** AMCAS reports county information using a combination of county and state code. The AMCAS load process will load both legal county and county of birth, if appropriate conversion values are defined. Your institution may choose to load some, all, or no county information.

Verify that values exist in the County Code Validation Form (STVCNTY) for the necessary county codes, or build new entries as needed.

If values for AMCAS counties do not exist in STVCNTY, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If AMCAS county codes are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVCNTY validation table, the county data reported by AMCAS will not be loaded.

 **Note**

You can build values on SOTCNVT for AMCAS state/county codes, if you want to load county of birth and county of residence data. AMCAS reports both county of birth and county of residence. If you choose not to load county data, skip this step.

To report this county data, AMCAS uses a combination of state and county codes. (The same county code may be used with multiple states.) In order to load this AMCAS information, you will need to do the following:

- Determine the counties which you want to load. In most cases, only state-supported schools will need to load county data, and then only for counties in their home state.
- Develop codes on the County Code Validation Form (STVCNTY) for the counties for which data should be loaded. Note that, unlike AMCAS,

STVCNTY does not use state to distinguish among counties in different states, and that each county code must be unique.

- 1.13. Verify that values exist in the State/Province Code Validation Form (STVSTAT) for the necessary state/province codes, or build new entries as needed.

If values for AMCAS states/provinces do not exist in STVSTAT, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If AMCAS state codes and/or provinces are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVSTAT validation table, the state/province data reported by AMCAS will not be loaded.

- 1.14. Verify that values exist in the Admission Type Code Validation Form (STVADMT) for the necessary early decision or standard application types or build new entries as needed.

If a value for AMCAS early decision does not exist in STVADMT, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If AMCAS early decision values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVADMT validation table, an early decision value reported by AMCAS will not be loaded.

- 1.15. Verify that values exist in the Source/Background Institution Code Validation Form (STVSBGI) for the necessary prior colleges or build new entries as needed.

If values for prior colleges do not exist on STVSBGI, you will not be able to convert the AMCAS values to appropriate Banner values on SOTCNVT.

If AMCAS prior college values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVSBGI validation table, college codes reported by AMCAS will not be loaded.

 **Note**

You may not want to have all prior college codes set up in STVSBGI. AMCAS files will report up to six different college codes. If you do not want or need all possible six prior college codes to be loaded, you can use the AMCAS SAAERUL rules for *UNKNOWNPCOL2*, *UNKNOWNPCOL3*, *UNKNOWNPCOL4*, *UNKNOWNPCOL5*, and *UNKNOWNPCOL6*. You will still need to update the value for each of these rules on SAAERUL to provide a default value that can be used when each prior college does not convert. ■

- 1.16.** Verify that values exist in the Applicant GPA Type Validation Form (STVGPAT) for the necessary grade point average types, or build new entries as needed.

If values for these GPA types do not exist in STVGPAT, you will not be able to define an appropriate conversion value on the Electronic Admissions Application Rules Form (SAAERUL) for the group code *AGPA*.

If appropriate values are not defined on SAAERUL for group *AGPA*, the grade point average data reported by AMCAS will not be loaded.

### **Value**

*Freshman BCPM GPA*

*Freshman AO GPA*

*Freshman Total GPA*

*Sophomore BCPM GPA*

*Sophomore AO GPA*

*Sophomore Total GPA*

*Junior BCPM GPA*

*Junior AO GPA*

*Junior Total GPA*

*Senior BCPM GPA*

*Senior AO GPA*

*Senior Total GPA*

*PBUG BCPM GPA*

*PBUG AO GPA*

*PBUG Total GPA*

*Cumulative UG BCPM GPA*

*Cumulative UG AO GPA*

*Cumulative UG Total GPA*

*Graduate BCPM GPA*

*Graduate AO GPA*

*Graduate Total GPA*

### **Note**

There are no specific AMCAS values which must be translated for these GPA types. You must define appropriate codes so that you can enter the appropriate rule value on SAAERUL. ■

- 1.17.** Verify that values exist in the Applicant Course Summary Type Validation Form (STVCRSS) for the necessary course summary types, or build new entries as needed.

If values for these course summary types do not exist in STVCRSS, you will not be able to define an appropriate conversion value on SAAERUL.

If appropriate values are not defined on SAAERUL for the group *AGPA*, course summary data reported by AMCAS will not be loaded.

### Value

*Freshman BCPM Hours*

*Freshman AO Hours*

*Sophomore BCPM Hours*

*Sophomore AO Hours*

*Junior BCPM Hours*

*Junior AO Hours*

*Senior BCPM Hours*

*Senior AO Hours*

*PBUG BCPM Hours*

*PBUG AO Hours*

*Cumulative UG BCPM Hours*

*Cumulative UG AO Hours*

*Graduate BCPM Hours*

*Graduate AO Hours*

*Pass/Fail Hours Failed Hours*

*Pass/Fail Hours Passed Hours*

*AP Hours*

*CLEP Hours*

*High School BCPM GPA*

*High School AO GPA*

*High School Total GPA*

### Note

There are no specific AMCAS values which must be translated for these course summary types. You must define appropriate codes so that you can enter the appropriate rule values on SAAERUL. ■

- 1.18. Verify that values exist in the Test Code Validation Form (STVTEC) for the necessary test types, or build new entries as needed.

If values for these test types do not exist in STVTEC, you will not be able to convert the AMCAS values (or in this case the delivered AMCAS test codes) to appropriate Banner values on SOTCNVT.

If the values are not converted to valid Banner codes on SOTCNVT or exist as a one-to-one relationship in the STVTEC validation table, the test type data reported by AMCAS will not be loaded.

### Note

All MCAT test score codes have been delivered for STVTEC. These MCAT test scores are hardcoded for use by SRTLOAD. If your institution used different MCAT test scores prior to using this baseline version of

AMCAS processing or does not choose to use the delivered test scores, the test scores can be converted using SOTCNVT. The tape value would equal the delivered test code, and the conversion code would equal the MCAT test score you prefer to use. ■

- 1.19. Verify that a value exists in the Admission Test Score Source Code Validation Form (STVTSRC) for *Reported by AMCAS*, or build a new entry if needed.

If an appropriate value does not exist in STVTSRC, you will not be able to define a test source value on the Interface Validation Form (STVINFC).

If no appropriate test score source is defined on STVINFC, MCAT test data will still be loaded, but will be missing a test score source.

- 1.20. AMCAS reports an MCAT Series Code which indicates the test series number used by the application when the MCAT tests were taken. This value will be loaded into each MCAT test record inserted by SRTLOAD (stored in the column SRTTEST\_TEFR\_CODE). The MCAT series code is a numeric value between 00 and 99. Load these 100 values into the Test Form Validation Form (STVTEFR) so that the MCAT Series Code can be loaded.

 **Note**

If you do not wish to load all 100 values during set-up, you can use the results from SRTLOAD to determine those values which are in the current AMCAS file which do not already exist in STVTEFR. After running SRTLOAD in Audit Mode, review the validation errors to determine the TEFR codes that did not convert. Then create any missing values before continuing to process the current AMCAS file. You may set up an SOTCNVT conversion for *TEFR*, but if the valid STVTEFR code matches the tape value, the *TEFR* code will be loaded. ■

- 1.21. Verify that values exist in the Application Fee Waiver Reason Validation Form (STVWAIV) for AMCAS Fee Waiver and for MCAT Scores.

If appropriate values do not exist in STVWAIV, you will not be able to define conversion values on SAAERUL for the *AMCASFWAV* rule label.

2. Verify that the following values exist in the Electronic Admissions Application Rules Form (SAAERUL) and that the **Value** column has been updated to an appropriate institutional value.

If these values do not exist, enter them manually on SAAERUL. Set the **Value** column to the appropriate institutional value as you enter the appropriate rule.

 **Note**

Please be aware that all SAAERUL rules need to be evaluated and updated accordingly, in addition to the rules listed below which are used specifically for AMCAS processing. SAAERUL rules other than those listed below are used for other types of data loads, and those rules could also be applicable to AMCAS. ■

Group Code	Rule Label	Rule Description	Delivered Value
ACHR	AOCUH	Cumulative UG AO Hours	<i>UPDATE ME</i> - Update the Value column to the value from the Applicant Course Summary Type Validation Form (STVCRSS) which should be used for Cumulative Undergraduate AO hours.

AGPA	TOTS	Sophomore Total GPA	<i>UPDATE ME</i> - Update the Value column to the value from the Applicant GPA Type Validation Form (STVGPAT) which should be used for Total Sophomore grade point averages.
AGPA	TOTSR	Senior Total GPA	<i>UPDATE ME</i> - Update the Value column to the value from the Applicant GPA Type Validation Form (STVGPAT) which should be used for Total Senior grade point averages.

Group Code	Rule Label	Rule Description	Delivered Value
PREL	AMCASCHKLSTONLY	Load items only on SAACHKB	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to indicate if all checklist items should be created (<i>N</i>) or only those specific to AMCAS (<i>Y</i>).</p> <p>If no designation is made, schools where the person was also an undergraduate (with test score records, prior college records, and high school records, each with an ADMR code) would have checklist items created for those records, because they are generated automatically.</p> <p>Medical schools generally will only want to consider those checklist items that pertain specifically to their requirements.</p>
PREL	AMCASCREATALTID	Load Alternate ID to SPRIDEN	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to indicate if the AMCAS ID should be created as an alternate ID on SPRIDEN.</p> <p>This rule determines whether the AMCAS ID should be loaded to SRTIDEN/ SPRIDEN as an alternate ID. The <code>SRTIDEN_NTYP_CODE</code> is set to the <i>AMCASNTYP</i> rule for the group ADMS. This allows the AMCAS ID to be used as part of search on the “IDEN” forms. If the rule is <i>N</i>, then the AMCAS ID will only be stored on SABSUPL.</p>
PREL	AMCASFWAV	AMCAS Fee Waiver	<p><i>UPDATE ME</i> - Update the Value column to the value from the Application Fee Waiver Reason Validation Form (STVWAIV) which will update the application fee waiver when the AMCAS <code>FEE_WAIVER</code> column is <i>Y</i>.</p>
PREL	AMCASHSGPACRSS	Load High School GPA Crse Hrs	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to load high school GPA and course hour data to SOAGPAT/SOACRSS for application number and term.</p> <p>If the <i>CREATEAPPL</i> rule is <i>N</i>, the term will be set to 999999 and the application number to 0.</p>

Group Code	Rule Label	Rule Description	Delivered Value
PREL	AMCASNTYP	AMCAS ID Type Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Name Type Validation Form (GTVNTYP) which will be used as the name type when an alternate ID is loaded based on the <i>AMCASCREATALTID</i> rule being set to <i>Y</i>.</p> <p>When the <i>AMCASCREATALTID</i> rule is set to <i>Y</i> and an AMCAS ID is loaded to SPRIDEN, the <i>AMCASNTYP</i> will be loaded with the ID.</p>
PREL	CHKINACTIVEADDR	Check Inactive Address	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to check inactive addresses for matched AMCAS records.</p> <p>Used when incoming street address fields are too long for SPRADDR and when an address has been inactivated (not end dated), and re-entered (Create Record/Duplicate Record) with appropriate abbreviations.</p> <p>If the <i>CHKINACTIVEADDR</i> rule is <i>Y</i>, when the address is loaded the same way as original, it is compared to the inactive address, so a new address is not created.</p>

For example: On an incoming file, street lines 1 and/or 2 are 40 characters long. The SPRADDR street lines 1 and 2 are only 30 characters long. The 40 character lines will be truncated when loaded to SPRADDR.

Access the Address window on SPAIDEN (SPRADDR), and view the truncated address. Use Duplicate Record and create a new sequence number of the address for street line 1 and/ or 2 with appropriate abbreviations. Return to the truncated address that was loaded from the incoming file. Do not modify that address, but set it as inactive. Save the changes.

When the *CHKINACTIVEADDR* rule is *Y*, if the exact 40 character street lines come in again on tape, the process will look at the inactive address for comparison and not insert the (truncated and essentially the same) address a second time.

This functionality works in conjunction with the *NEWADDRESS*, *ADDSAMETYPE*, and *ADDDIFFTYPE* rules.

Group Code	Rule Label	Rule Description	Delivered Value
PREL	DFLTRESDCODE	Default Residency Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Residence Code Validation Form (STVRES D) which should be used as the default residence code for the applicant.</p> <p>When the residence code is unclear on the incoming file, this value will be used for the applicant residency.</p>
PREL	FORRESIDCODE	Out of Country Residence Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Residence Code Validation Form (STVRES D) which should be assigned to applications determined to be foreign residents. Residency will be derived from the value supplied by the applicant for state of legal residency.</p> <p>When the AMCAS LEGAL STATE CODE on the tape is null, then this value is loaded for the applicant.</p>
<p><b>Note:</b> If you do not want the AMCAS load process to attempt to derive an applicant's residency, you may set this value to a valid value from STVRES D which indicates "residency needs to be determined". If residency is not an issue for your institution, the three residency rules may all be set to use the same value.</p>			
PREL	HOMESTATPROV	Institution's Home State/Prov	<p><i>UPDATE ME</i> - Update the Value column to the value from the State/Province Code Validation Form (STVSTAT) which represents the Institution's Home State or Province to determine the state of residency for the applicant.</p>
PREL	INRES DICODE	In State/Prov Residency Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Residence Code Validation Form (STVRES D) which should be assigned to applicants determined to be in-state residents.</p> <p>When the AMCAS LEGAL STATE CODE is not null, and the STAT_CODE matches the HOMESTATPROV value, then this value is loaded for the applicant.</p>
<p><b>Note:</b> If you do not want the AMCAS load process to attempt to derive an applicant's residency, you may set this value to a valid value from STVRES D which indicates "residency needs to be determined". If residency is not an issue for your institution, the three residency rules may all be set to use the same value.</p>			
PREL	LOADPERCENTILES	Load Percentiles on Test Score	<p><i>UPDATE ME</i> - Update the Value column to Y or N to load SAT or GRE test score percentiles to the SORTSPC table and view them on the SOATEST form.</p>

Group Code	Rule Label	Rule Description	Delivered Value
PREL	MCATPREVAPPYR	Update AMCAS App Yr Fields	<i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to update previous AMCAS application year fields on SOASUPL for the term and application.
PREL	MCATUPDMATCHES	Update Matched AMCAS Records	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to update/insert data on matched AMCAS records. The tables that can be updated/inserted by this rule include SABSUPL, SORCRSS, and SORGPAT.</p> <p>When <i>MCATUPDMATCHES</i> is <i>Y</i>, an incoming AMCAS record matches the Banner record, and a matched application also exists for term, level, degree, college, major, and department, missing data on SABSUPL, SORCRSS, and SORGPAT will be updated. Also, previously existing Banner data on SABSUPL that is different than incoming data (AMCAS ID, City of Birth, Race, Admit Nation, etc.) will be overwritten to retain the latest supplemental information for that applicant/matched application.</p>
PREL	OUTRESIDCODE	Out of State/Prov Resid Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Residence Code Validation Form (STVRESID) which should be assigned to applications determined to be from out-of-state residents.</p> <p>When the AMCAS LEGAL STATE CODE is not null, and the STAT_CODE does <i>not</i> match the <i>HOMESTATPROV</i> value, then this value is loaded for the applicant.</p>

**Note:** If you do not want the AMCAS load process to attempt to derive an applicant's residency, you may set this value to a valid value from STVRESID which indicates "residency needs to be determined". If residency is not an issue for your institution, the three residency rules may all be set to use the same value.

Group Code	Rule Label	Rule Description	Delivered Value
PREL	UNKNOWNPCOL2, UNKNOWNPCOL3, UNKNOWNPCOL4, UNKNOWNPCOL5, UNKNOWNPCOL6	Default Prior College SBGI Code	<p><i>UPDATE ME</i> - Update the Value column to the value from the Source/Background Institution Code Validation Form (STVSBGI) to load unknown colleges.</p> <p>AMCAS files may report up to six different prior colleges per applicant. When the prior college value on the AMCAS file has an SBGI code that does not convert on SOTCNVT or validate directly from STVSBGI, and the description does not translate, then the colleges are "unknown", and the codes assigned to these <i>UNKNOWNPCOL2</i> - <i>6</i> rules will be loaded.</p> <p>(The <i>UNKNOWNPCOL</i> rule will apply to AMCAS Prior College #1. <i>UNKNOWNPCOL%</i> rules 2 through 6 are used when the remainder of the SBGI codes do not translate.)</p>
PREL	UNKNOWNPCOL7	Default Prior College SBGI Code	<p><i>UPDATE ME</i> - This rule is currently not used in Banner. Values must exist on Source/Background Institution Code Validation Form (STVSBGI).</p>
PREL	UPDATESSN	Replace Banner SSN with incoming	<p><i>UPDATE ME</i> - Update the Value column to <i>Y</i> or <i>N</i> to replace a not null Banner SSN.</p> <p>When set to <i>Y</i>, if the incoming SSN on tape does not match the existing Banner SSN, and the record has been matched, upon being loaded to Banner, the incoming SSN will overwrite the existing SPBPERS_SSN.</p> <p>When set to <i>N</i>, the SSN is not updated if it has changed.</p>

3. Five values reported by AMCAS will be loaded into user-defined flags displayed on the Application Supplemental Information Form (SOASUPL). In order to reflect the information which will be reported by AMCAS, update the descriptions for the five flags on the Application User Defined Flags/Fields Form (SAAAUDF).
  - 3.1. Disadvantaged data will be loaded to **Flag 1**, if supplied by AMCAS.
  - 3.2. Military Service data will be loaded to **Flag 2**, if supplied by AMCAS.
  - 3.3. Previous Matriculation in another medical school will be loaded to **Flag 3**, if supplied by AMCAS.

- 3.4. Institutional action (dismissal, suspension, etc.) by another institution will be loaded to **Flag 4**, if supplied by AMCAS.
- 3.5. Felony data supplied will be loaded to **Flag 5**, if reported by AMCAS.

 **Note**

For institutions using the AMCAS load process, these five flags must be set to reflect the AMCAS values, and are in effect reserved for these values. Institutions can make whatever use is appropriate of the other five user-defined flags. Institutions that do not use the AMCAS load process can use all ten user-defined flags as desired. ■

You have now completed all required set-up procedures and are ready to process your first AMCAS application file.

## AMCAS Application Load Processing and Reporting Procedures

After completing your set-up procedures, you are ready to begin processing AMCAS admissions application files. AMCAS application processing uses the Banner baseline tape load processing to:

1. load application data to a set of temporary tables via SRTLOAD, and then view the data using SRIPREL/SRAPREL,
2. match the data through SRRSRIN batch processing or manually on GOAMTCH,
3. load the data to the Banner permanent tables through SRRPREL batch processing or manually on SRIPREL, and
4. allow the deletion of the temporary data using SRTPURG.

### Banner Programs

The following is the list of programs used for the AMCAS application load process:

Program	Description
srtload.pc	PRO*C program that loads data from a search file (PSAT or PCU) or a test score report file (SAT, AMCAS) to temporary tables.
srrsrin.pc	PRO*C program that determines a record's match status and will potentially loads records to Banner when comparing temporary data in the Search Tape View (SRVPREL) to Banner production data.

Program	Description
srrprel.pc	PRO*C program that creates or updates Banner data including recruiting and/or admissions records based on information in the temporary tables and rule settings on SOTCNVT and SAAERUL.
srtpurg.pc	PRO*C program that delete records from the temporary tables.

## Banner Forms and Tables

The following temporary tables store data that can be viewed on SRIPREL/SRAPREL: SRTIDEN, SRTPERS, SRTTELE, SRTADDR, SRTTEST, SRTPREL, SRTHSCH (not applicable to AMCAS), SRTPCOL, SRTEMAL, SRTGPAT, SRTCRSS, SRTSUPL, SRTPRAC, SRTDEGR, SRTMAJR, SRTTSPC (percentiles - not applicable to AMCAS).

The following is a list of the Banner tables that will be updated by the Electronic Load Process (SRTLOAD) and the Banner forms on which the data can be viewed:

Table	Description	Processing Notes
SPRIDEN	Identification Table	Names and IDs will be loaded into SPRIDEN. SPRIDEN records will be inserted whenever new and/or changed names or IDs are reported. In the case of name or ID changes, the current SPRIDEN record will be made inactive and a new, current one inserted. SPRIDEN records are viewed on the General Person Identification Form (SPAIDEN).
SPRADDR	Address Repeating Table	Address information will be loaded into SPRADDR, based upon an address type supplied in the parameter for the SRTLOAD process and rule values on SAAERUL. As new addresses are received on subsequent tapes, the current address of the same address type will be end-dated, and the new address will be inserted. This will allow schools to keep a record of addresses. It is still recommended that an "AMCAS Address Type" be used for all AMCAS processing. Addresses are viewed on the General Person Identification Form (SPAIDEN).
SPRTELE	Telephone Table	Telephone numbers will be loaded into SPRADDR, based upon a telephone type supplied in the parameter for the SRTLOAD process and rule values on SAAERUL. Telephone numbers will be loaded into SPRTELE. It is recommended that an "AMCAS Telephone Type" be used for all AMCAS processing. The telephone associated with an address can be viewed on the General Person Identification Form (SPAIDEN), and all telephone numbers can be viewed on the General Person Telephone Form (SPATELE).

Table	Description	Processing Notes
SPBPERS	Basic Person Base Table	Person biographic and demographic data will be loaded into SPBPERS. Biographic/demographic data includes gender, ethnicity, ethnic category, date of birth, and SSN. SPBPERS records will be inserted when one does not already exist for a person being processed. Where a record already exists, data will be updated when the Banner value is currently null, but existing values will not be changed. Person data is viewed on the General Person Form (SPAPERS).
GORPRAC	Race Table	Race will be loaded to GORPRAC. Only unique race values for a PIDM will be loaded. GORRACE records will be inserted when one does not already exist for a person being processed. When a record already exists, only unique incoming race codes will be inserted, and existing values will not be changed. Race data is viewed on the General Person Identification Form (SPAIDEN).
GOBINTL	Person International Information Table	Visa information will be loaded into GOBINTL. When a visa type is present in the information, the nation of birth, nation of citizenship, and number of dependents (if present in the AMCAS data) will also be loaded to GOBINTL. GOBINTL records will be inserted when one does not already exist for a person being processed. When a record does already exist, data will be updated when the Banner value is currently null, but existing values will not be changed. International student data is viewed on the International Information Form (GOAINTL).
GOREMAL	E-mail Address Table	Email addresses will be loaded into GOREMAL, based upon an email type code specified in the parameter for the SRTLOAD process. Email addresses will always be completely overwritten by the AMCAS load process. Therefore, it is recommended that an "AMCAS E-mail Address Type" be used for all AMCAS processing. Email addresses are viewed on the E-mail Address Form (GOAEMAL).
SORCRSS	Applicant Course Summary Table	Course summary data will be loaded into SORCRSS, based upon course summary types specified in the Electronic Admissions Application Rules Form (SAAERUL) in the group code <i>ACHR</i> . Course summary records may be completely overwritten by the AMCAS load process. Course summary data are viewed on the Applicant Course Summaries Form (SOACRSS).

Table	Description	Processing Notes
SORGPAT	Applicant GPA Types Table	Grade point average data will be loaded into SORGPAT, based upon grade point average types specified in the Electronic Admissions Application Rules Form (SAAERUL) in the group code <i>AGPA</i> . Grade Point Average Type records may be completely overwritten by the AMCAS load process. Grade Point Average types are viewed on the Applicant GPA Types Form (SOAGPAT).
SORTEST	Student Test Score Repeating Table	MCAT test data will be loaded into SORTEST, based upon the hardcoded values MBS, MPS, MVR, and MWS. If these hardcoded test scores need to be changed to different codes for any reason, they can be converted on SOTCNVT. Test records will never be overwritten or updated. Test data is viewed on the Test Score Information Form (SOATEST).
SORPCOL	Prior College Table	Prior college data will be loaded into SORPCOL, based upon school code conversions on SOTCNVT and rules on SAAERUL. A prior college record will be inserted for a school if one does not already exist, but prior college records will never be updated. Prior college data is viewed on the Prior College Form (SOAPCOL).
SORDEGR	Prior College Degree Table	Prior college attendance and degree data reported by AMCAS will be loaded into SORDEGR, based upon degree code conversion rules specified on SOTCNVT. Prior college attendance and degree data may include degree pursued, dates of attendance, date of degree, and prior college program type. SORDEGR records will be inserted when one does not already exist for a prior college and degree being processed. Where a record does already exist, data will be updated when the Banner value is currently null, but existing values will not be changed. Prior college data is viewed on the Prior College Form (SOAPCOL).
SORMAJR	Prior College Major Repeating Table	Prior college majors will be loaded into SORMAJR, based upon major code conversion rules specified on SOTCNVT. A prior college major record will be inserted for a school/degree combination if one does not already exist, but prior college major records will never be updated. Prior college data is viewed on the Prior College Form (SOAPCOL).

Table	Description	Processing Notes
SARADAP	Admissions Application Repeating Table	<p>Admissions applications will be loaded into SARADAP using a variety of rules (SRTLOAD parameters, SOTCNVT rules, SAAAERUL rules and/or SRAPRED defaults) for the values to be inserted.</p> <ul style="list-style-type: none"> <li>• Term code, level code, campus code, AMCAS degree code, AMCAS major code, and department code are handled by parameters for the SRTLOAD process.</li> <li>• Residency will be derived from the AMCAS-reported state of legal residence and rules in the labels <i>DFLTRESDCODE</i>, <i>FORRESIDCODE</i>, <i>INRESIDCODE</i>, and <i>OUTRESIDCODE</i> for the group code <i>PREL</i> and the value for home state/province in the label <i>HOMESTATPROV</i> for the group code <i>PREL</i> in the Electronic Admissions Application Rules Form (SAAERUL).</li> <li>• Admission type will be derived from the AMCAS-reported early decision consideration field and values for admission type on SOTCNVT for a conversion value of <i>ADMT</i>.</li> <li>• The AMCAS admission degree may also be converted on SOTCNVT using the validation table name <i>DEGA</i> for the AMCAS value <i>APPL_TYPE</i>. This conversion will override the SRTLOAD value for AMCAS Degree Code parameter.</li> <li>• Student type, which is a required field for all applications, will need to be established on SRAPRED for the level code for which you are running SRTLOAD. This will be the only option for inserting the student type for AMCAS applications. Other optional fields on SRAPRED may also be established, but please note that these values are loaded last when no other value has been established during processing.</li> </ul> <p>Admissions applications will be inserted by SRTLOAD for new records. Admissions applications will never be updated by subsequent change processing. Admissions Applications are viewed on the Admissions Application Form (SAAADMS).</p>
SARCHKL	Admissions Checklist Repeating Table	<p>Admissions checklist items will be loaded into SARCHKL, using a variety of rules for the values to be inserted:</p> <ul style="list-style-type: none"> <li>• An MCAT checklist item will be inserted based upon the value on <i>STVTESSC</i>. If scores are received, the “Received Date” will be set to the date when the AMCAS data is loaded into Banner, and the date the test was taken will be populated in the Comment field. If a “Next MCAT Test Date” is supplied, the next test date will be populated in the Comment field.</li> <li>• Checklist items can be viewed for the applicant on SAAADMS.</li> </ul>

Table	Description	Processing Notes
SABSUPL	Application Supplemental Information Base Table	<p>A number of data elements will be inserted into SABSUPL based upon a variety of translation and rules values, including cross-reference values for nation codes, county codes, ethnic codes, race codes, special consideration codes, and college codes. In addition, five AMCAS values will be used for user-defined flags 1 - 5:</p> <ul style="list-style-type: none"> <li>• Disadvantaged data will be loaded to <b>Flag 1</b>, if supplied by AMCAS.</li> <li>• Military Service data will be loaded to <b>Flag 2</b>, if supplied by AMCAS.</li> <li>• Previous Matriculation in another medical school will be loaded to <b>Flag 3</b>, if supplied by AMCAS.</li> <li>• Institutional action (dismissal, suspension, etc.) by another institution will be loaded to <b>Flag 4</b>, if supplied by AMCAS.</li> <li>• Felony data supplied will be loaded to <b>Flag 5</b>, if reported by AMCAS.</li> </ul> <p>SABSUPL data can be viewed on SOASUPL.</p>
SORCCOL	Communication Plan Collector Table	<p>Two communication plan collector records will be inserted into SORCCOL when a new application is inserted. SORCCOL records allow an institution to assign a communication plan and generate materials for applications created by the load process. Communication plan collector records are viewed and processed on the Communication Plan Collector Form (SOACCOL). In order to process the records in SORCCOL, you will need to run the Communication Plan Processing Report (SORCPLN).</p>

## Steps to be Followed in AMCAS Load Processing

Please refer to the “Tape Load and Match Processing” and “Search and Test Score Tape Load” procedure sections in the Recruiting and Admissions chapters for more information on tape load processing using SRTLOAD and matching.

1. Retrieve the AMCAS application data file to be processed and place it in the appropriate working directory using any name, but remembering the maximum length of the path/filename is 30 characters.
2. Run the Electronic Prospect Load (SRTLOAD), which loads data from the AMCAS file to the temporary tables.

SRTLOAD produces the report file `srtload.lis` which indicates how many records were loaded or potentially loaded if run in Audit Mode. Once SRTLOAD has been

run, carefully review the results for validation errors, conversion errors, etc., and make necessary corrections in validation tables, on SOTCNVT, etc.

 **Note**

Always run SRTLOAD in Audit Mode first to determine the values that are missing in Banner. These values will need to be created in Banner or converted on SOTCNVT (where appropriate) before running SRTLOAD in update mode. ■

3. Run the Electronic Prospect Match (SRRSRIN) to match the tape data and update each record's match status with a value of *M* (matched), *N* (new), *D* (duplicate), *S* (suspense), or *E* (error). This process uses the matching rules on GORCMRL for the matching source code identified with the prospect code on STVPREL.

 **Note**

You may also choose to run SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y*. In this mode, as records are flagged as matched (*M*) or new (*N*), they will also immediately be loaded to the Banner production tables. Suspended (*S*) records will still need to be reviewed and resolved manually using SRIPREL/GOAMTCH.

Setting this parameter to *Y* will prevent the flagging of duplicates (*D*) (which means that there are multiple/duplicate records for the same person on the incoming file). A SRRSRIN status of *D* (duplicate) does not indicate that the record is a duplicate in Banner. When the Auto Load (Skip Dup Chk) parameter is set to *Y*, the SRRPREL process does not have to be run for the same electronic prospect code/tape ID. ■

4. Run the Migrate Electronic Prospects Process (SRRPREL). Based on rule settings, this report will:

- automatically load new and matched records to Banner,
- create new search or test score records or update existing search or test score records,
- create new recruiting records,
- create new application records,
- insert new source data into existing recruiting and admissions data,
- insert college, degree, and major data,
- insert various supplemental data,
- insert international data where applicable,
- insert email addresses, and
- insert GPA and course hour data.

5. Run the Electronic Prospect Purge (SRTPURG) to remove records from the temporary tables based on the report parameter values, once you are finished with the temporary data records.
6. Run the Communication Plan Process (SORCPLN) to assign communication plans and generate materials for persons processed by the AMCAS load.

This step is optional but highly recommended.

If you do not run SORCPLN, communication plan assignment and material generation will not take place, and the records inserted in the Communication Plan Collector Table (SORCCOL) will not be processed. Note that SORCPLN processes all records in the Communication Plan Collector Table, regardless of source, so existing records other than those inserted by SRRPREL will also be processed.

## Common Matching for AMCAS Processing

SRRSRIN uses common matching for AMCAS processing, including matching on variables for SSN, last name, AMCAS ID, and old last name. Matching will occur against SRTSUPL\_AMCAS\_ID (if it is part of the GORCMRL rule) and SRTIDEN\_LAST\_NAME\_OLD (if it exists on the tape).

The insert to GOTCMME includes the ID. ID will be populated with the AMCAS ID and will be used in the secondary match against the Banner ID, if it is part of the GORCMRL rule. If SRRSRIN is not processing an AMCAS data load, the ID will be null.

The insert to SOTCMME includes the AMCAS\_ID. The AMCAS\_ID will be populated with the AMCAS ID and will be used in secondary match if the `sakmtch.p_match_amcas_id` procedure is called to match against the SABSUPL\_AMCAS\_ID column for the matching rule. If SRRSRIN is not processing an AMCAS data load, the ID will be null.

When using the matching procedure for the AMCAS ID, SRRSRIN will most likely put a record into suspense if an incoming AMCAS ID is different from the current Banner AMCAS ID. This seldom happens but can occur. It is highly recommended that all suspended records be reviewed very carefully, and especially when matching manually, to resolve the suspension on GOAMTCH. You may consider matching records manually on GOAMTCH with a matching rule that does not consist of the AMCAS ID but has an SSN (or not since AMCAS does not require the AMCAS ID), the City/ZIP, Date of Birth, etc., to prevent creating new records that are not truly new.

SRRSRIN will most likely put a record into suspense when an old last name exists that is different from the current name. It is highly recommended that suspended records with an old last name be viewed carefully on SRIPREL, and especially when matching, to resolve the suspension on GOAMTCH. Records with an old last name will also appear on the SRRSRIN report as “Former Last Name”. It is recommended that the SSN be used as part of the matching rule on GOAMTCH to prevent the possible creation of duplicate IDs.

All data from the incoming file may be matched *and* loaded in a single step by SRRSRIN when the Auto Load (Skip Dup Chk) parameter is set to *Y*. Rules on SAAERUL are checked, and rules on SRAPRED are applied appropriately. Running SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y* allows you to omit using SRRPREL in the processing. This cuts down on the flagging of duplicate records on the incoming file.

As records are assigned a match status (*N, M*), they are immediately loaded to Banner so that if another record is found on the incoming tape that is a duplicate, it will be found to be a match and will be loaded immediately. Otherwise, duplicate records on the incoming file are marked *D* and will need to be resolved manually on SRIPREL and/or GOAMTCH.

When the Auto Load (Skip Dup Chk) parameter is set to *N*, SRRSRIN will simply assign the match status, the output file and records can be reviewed if necessary prior to being loaded to Banner, and then SRRPREL can be run to move the records to Banner.

When data is loaded to Banner, the load hierarchy is as follows:

1. Values from SOTCNVT will be loaded first, if they exist.
2. Values from the SRTLOAD parameters will be loaded second, if they have been entered.
3. Values from STVINFC (contact type and/or source code) will be loaded third, if they exist, and if valid parameter values do not exist on SRTLOAD.
4. Values from SRAPRED will be loaded fourth, if they exist.

 **Note**

For AMCAS, the student type will always need to be updated on SRAPRED for the level for which you are running SRTLOAD, in order for the required student type value to be loaded for the applicant. If you load AMCAS files without having a default student type on SRAPRED and then access an application that was created without the required student type, you may experience errors on the form and will need to insert the student type at that time. ■

When records are matched through batch processing, SRTLOAD loads the address source from the temporary tables to the SPRADDR table. SRRSRIN then calls SRKPREL to push the address data, and therefore loads the SRTADDR\_ASRC\_CODE value to the SPRADDR\_ASRC\_CODE field.

When matching is performed manually using SRIPREL and GOAMTCH, SRIPREL saves the prospect's address to the GOTCMME table. GOAMTCH then creates the address for the new person record from the GOTCMME table, including the ASCR\_CODE data.

## AMCAS Report Detail

SRRSRIN provides matching data in its output, as well as a report of name changes. When matches are found, columns are printed providing the current last name on the incoming file, as well as the former last name that may be a match to the Banner last name. This name information is helpful when resolving possible suspended records where an old last name from a file matches the existing/current Banner last name.

For example, if you had an AMCAS applicant that was previously been loaded to Banner with the name “Smith”, and the applicant exists on a new incoming file with a married name of “Jordan”. “Smith” would be the old last name that may be matched to the `SPRIDEN_LAST_NAME`, but “Jordan” is the current last name. Depending on how your matching rules are set up, you may receive suspended records in this situation. It will be important to review the SRRSRIN report output for records with former last names and carefully match them on GOAMTCH.

Information for “bad” address data, such as foreign addresses, that does not meet Banner requirements, can be identified on SRRPREL and SRIPREL using API processing. After records are matched and receive a status of *M* or *N*, if address data that is to be loaded is found to be incomplete, the API errors will be trapped and presented to the user either directly on SRIPREL (if they are performing a manual load), on SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y* (if they are bypassing SRRPREL), and finally on SRRPREL. These records will *not* be loaded, and the match status will revert to *S*. Messages will be supplied to indicate the data issue that must be resolved, and then the temporary data issues can be resolved, and records can be re-matched and re-loaded.

Information for applications added is produced by SRRSRIN. The report information is provided when the Auto Load (Skip Dup Chk) parameter is set to *Y*, (since the SRRPREL process will be omitted when running SRRSRIN with the Auto Load (Skip Dup Chk) parameter set to *Y*). There is no option to not print this information on the reports. When the Auto Load (Skip Dup Chk) parameter is set to *Y*, if an application has been created for the ID, then the ID, term, and application number will be printed on the report. In the Record Count section at the bottom of the report, summary information is also printed for all records that are loaded to Banner. This includes number of persons loaded, number of prospects, loaded, and number of applicants loaded. This is helpful information for all tape types.

Information for applications added is produced by SRRPREL. There is no option to not print this information on the reports. If an application has been created for the ID, then the ID, term, and application number will be printed on the report. The application number data will indicate that an application has been created. In the Summary Section of the report, summary information is also printed for all records that are loaded to Banner. This includes number of persons loaded, number of prospects loaded, and number of applicants loaded. This is helpful information for all tape types.

Data records on the report show that multiple types of records can be loaded from:

- SPAPERS - if no recruiting or applicant data is loaded,
- SPAPERS and SRBRECR - if person and recruiting data are loaded,
- SPAPERS and SARADAP - if no recruiting records are loaded,
- SPAPERS, SRBRECR, and SARADAP - if both recruiting and application records are loaded.

When data has not changed in SPBPERS, GOBINTL, SORDEGR, etc., and data exists in Banner, and the incoming AMCAS values are different, those differences are not reported. All incoming data to Banner in these tables and all other production tables is not updated when data in the file is different. However, the data is available for institutions to report against as they choose. The tape data remains stored in the temporary tables until it is deleted by running SRTPURG. Once the matching process (SRRSRIN) has been run against the tape data and has been updated with a match status, and a Banner PIDM assigned in the temporary table, any reporting requirements can be run against the temporary tables and associated production data for processing assistance prior to data loading.

## Using SRTLOAD With the 2008 AMCAS File Format

A different file format is used for the 2007-2008 application year. As it may be necessary to process 2007 application files well into the 2008 application year, Banner provides the capability to process both 2007 and 2008 file formats.

The 2007 AMCAS file has 322 positions, and the 2008 AMCAS file has 328 positions. The *AMCS08* (AMCAS 2008 Test Score File) tape type is used on STVTAPE to handle the number of fields in the 2008 AMCAS file. SRTLOAD will not run to completion when the number of positions on SRATPFD does not match the incoming AMCAS file. An error is displayed in the `.log` file.

Here is a sample of the error received in the `.log` file when SRTLOAD is run with the 2006-2007 AMCAS file (*AMCS* tape type) versus the 2007-2008 AMCAS file (*AMCS08* tape type).

```
*ERROR* Check number of delimiters in file (row 1) or delimiter type
against SORDLIM.
srtload terminated with error
5 lines written to /export/home/lparrish/jobsub/srtload_181942.lis
Connected.
Connected.
```

## Using the 2008 Tape Code

The *AMCS08* tape code on STVTAPE is used for 2008 AMCAS reporting. Do the following to use this code.

- Change the **Tape Code** value on STVPREL depending on which year is being processed.
  - Use the existing *AMCS* code to process files from 2007 and earlier.
  - Use the *AMCS08* code to process files from 2008.
- Verify that the interface code on STVPREL is appropriate for both the *AMCS* and *AMCS08* tape types.

The interface code on STVINFC incorporates the rules, test source, contact code, source, and matching rules from SOTCNVT. If different rules are needed for the *AMCS08* code, the STVINFC rules can be changed accordingly at your institution for the *AMCS* prospect code.

When the correct value is entered in the Electronic Prospect Code parameter when SRTLOAD is run, and the correct value is entered in the **Tape Code** field on STVPREL, the incoming AMCAS file (whether for 2007 and prior years or for 2008) should be processed appropriately.

### Additional Field Name Values, Flag Descriptions, and Fields

System-required **Field Name** values on STVTPFD for *ADDL\_MCAT\_INTENT\_IND*, *MCAT\_INTENT\_DATE*, *MILITARY\_DISCHARGE\_IND*, *MILITARY\_HON\_DISCHARGE\_IND*, and *MISDEMEANOR\_IND* are used with 2008 reporting. These values are also used on SRATPFDF.

Description values for **Flag 6** (*Misdemeanor*), **Flag 7** (*Military Discharge*), and **Flag 8** (*Military Honorable Discharge*) are used on SAAAUDF. These descriptions can be added manually and should be reviewed, since the form is term driven. SRTLOAD uses these flags to load the AMCAS 2007-2008 flags to the temporary tables in Banner.

The system-required *AMCS08* **Tape Code** value on SORDLIM, with a delimiter ( | ), is also used with this processing.

#### Note

No conversion changes are needed for 2008 for SOTCNVT. Users should confirm that their STVINFC rules (that include SOTCNVT) will function as needed when application year files for 2007 are processed versus files for 2008. ■

SRAPREL displays fields for **Misdemeanor**, **Military Discharge**, and **Military Honorable Discharge** in the Supplemental Data window. These indicators are *Y/N* fields which are populated from the SRTSUPL temporary table.

### AMCAS Field Notes

- *ADDL\_MCAT\_INTENT\_IND*

This field is a placeholder only and does not have any functionality associated with it.

- ADDL\_MCAT\_INTENT\_DATE

AMCAS processing will read the date, load the value to the SRTSUPL\_NEXT\_MCAT\_DATE field, and push the data to SOASUPL.

For 2008, the NEXT\_MCAT\_DATE will be null. However, if there is no intent date value, and there *is* a date, the process will attempt to load the next MCAT date.

- CBC\_FELONY\_IND

AMCAS processing will read this indicator, load the value to the SRTSUPL\_FLAG\_5 field, and push the data to SOASUPL.

- CBC\_MISDEMEANOR\_IND

SRTLOAD will read this indicator, load the value to the SRTSUPL\_FLAG\_6 field, and push the data to SOASUPL.

- CBC\_MILITARY\_DISCHARGE\_IND

SRTLOAD will read this indicator, load the value to the SRTSUPL\_FLAG\_7 field, and push the data to SOASUPL.

- CBC\_MILITARY\_HON\_DISCHARGE\_IND

SRTLOAD will read this indicator, load the value to the SRTSUPL\_FLAG\_8 field, and push the data to SOASUPL.

## Setup Checklist

When the 2007-2008 regulatory changes are installed you should do the following:

1. Review all object changes.
2. Test the new processing in your environment.
3. Change the **Tape Code** value on STVPREL to either *AMCS* or *AMCS08*, depending on which application year is being processed.
4. Verify that the interface code on STVPREL is appropriate for both the *AMCS* and *AMCS08* tape types.
5. Verify that the rules on SAAAUDF are appropriate for your institution's environment, since these values are term driven.
6. Review SAAAUDF to be sure the three new flag descriptions for *Misdemeanor*, *Military Discharge*, and *Military Honorable Discharge* have been updated appropriately for your institution, since the form is term driven.

These flags will not be migrated to SOASUPL/SABSUPL if not they have not been updated in SAAAUDF.

7. Confirm that STVINFC rules that include SOTCNVT will function as needed for 2007 application year files and 2008 application year files.

## Using SRTLOAD With the 2010 AMCAS File Format

The FEE\_WAIVER item uses valid values of *NULL*, *0*, *1*, or *2*, instead of *Y* or *N*.

Value	Description
NULL	No FAP application has been submitted.
0	An FAP application was submitted but was not approved.
1	An FAP application was submitted, was approved, and the approval was applied to the submission of the AMCAS application.
2	An FAP application was submitted, was approved, but was not applied to the submission of the AMCAS application.

SRTLOAD processes a value of *Y* or *1* in the same manner, so that FEE\_WAIVER is set to *Y/ON*. Any other FEE\_WAIVER value is processed as *N/OFF*.

## AMCAS Admissions Action File Creation

### Overview

The AMCAS Extract File (SARAMXF) process allows medical schools to create a flat file containing the data required by AMCAS as part of the AMCAS Admissions Action File. This file can then be submitted electronically (via FTP) to AMCAS. The SAVAMC2 view is used to create this flat file.

Three Banner Student Object:Access views (SAVAMCD, SAVAMCT, and SAVAMC2) are used in AMCAS processing to allow medical schools access to the data they need to meet their reporting requirements.

### Flat File Process

The flat file is created in the required AMCAS format that contains the AMCAS admissions actions for applicants. Additional information on the file format and guidelines appears below in the section *Submitting Actions via FTP*. Two parameters must be included as entries on the Electronic Admissions Application Rules Form (SAAERUL), where the group code is *ADMS* for the rule label of *AMCASSCHCODE* (your school's AAMC school code) and the rule label of *AMCASSCHSTAT* (your school's state code).

#### Note

When processing an ID, the extract first checks the *SPRIDEN\_ID* field for the AMCAS ID, to ensure that the name type matches the *AMCASNTYP* rule label on SAAERUL for group code of *ADMS*. If no value is found, it

then pulls the AMCAS ID from the `SABSUPL_AMCAS_ID` field on `SABSUPL` and stores it in the appropriate place in the outgoing flat file. ■

In order for each medical school's unique decision codes to be translated into acceptable AMCAS codes, the EDI Cross-Reference Rules Form (SOAXREF) uses the Admission Application Decision Code Validation Form (STVAPDC) codes as `XLBL_code`.

The process reads all application records having the same level and term entered as input parameters (i.e., *not* just the most recent application for that level/term). In addition, you must indicate if you want to run the process in Audit or Update mode. If you choose Audit, the process will create an extract report which details what records would be included in the extract file if the process were run in Update mode. If the parameter is set to Update, the extract report will be created as well as the extract file to be sent to AMCAS. In addition, the `SABSUPL_AGENCY_REPORT_DATE` field on the Application Supplemental Information Form (SOASUPL) is updated with the system date to indicate that the record has been processed. A separate purge process deletes the date entered into the `SABSUPL_AGENCY_REPORT_DATE` field if the flat file needs to be recreated.

SARAMXF retrieves the most recent decision row for an applicant using the SAVAMC2 view. The date of this decision code record is verified as greater than or equal to the value in the `SABSUPL_AGENCY_REPORT_DATE` field on the Application Supplemental Information Form (SOASUPL). If this is the case, the process continues. Otherwise, the process goes to the next applicant/application. If the decision code (`SAVAMC2_ADMIT_ACTION_CODE`) equals the decision code on SOAXREF which has a corresponding EDI value that matches the value in the `AMCASDELCODE` rule on SAAERUL (i.e., *D*), then the process finds the next most recent decision row for the applicant where the decision code equals a decision code cross-referenced on SOAXREF, where the value in the **EDI Label** field is `STVAPDC`, and the value in the **EDI Qualifier** field is `AN%`.

This decision code is used to create the record to be sent in the AMCAS flat file. A value of *D* is inserted into the `DELROW` field on the flat file to indicate that a prior row (which is identical) should be removed. (The `DELROW` field is used to indicate that the prior action sent for an applicant needs to either be corrected or deleted.) The value of the `SABSUPL_AGENCY_REPORT_DATE` field is updated with the system date. Additional pipe delimiters are used as needed to handle the final four fields, which are NULL.

Be certain that a value exists on the EDI Verification Label Validation Form (STVXLBL) for STVAPDC with a description of Application Decision Codes. If an institution has more than one decision code that maps to one AMCAS code, the codes must be entered on SOAXREF with an EDI qualifier code of `AN`, `AN1`, `AN2`, etc., because SOAXREF will not allow more than one mapping between EDI Value and Banner Value.

The process then creates a record in the flat file for each applicant that passes the above tests. The guidelines for creating the flat file and the layout of each record are described below.

## Submitting Actions via FTP

### Note

The following text and bullet points come from the AMCAS Admissions Action File documentation. ■

Schools may submit admission actions via a text file posted to the school folder on the AAMC FTP site. To ensure timely information on reports and adherence to traffic rules, AMCAS recommends this be done daily; however, this may represent a hardship for some schools, so weekly is acceptable. There will be a three to five business day turnaround for actions submitted in this manner to be validated, loaded to the AMCAS database, and available for reports. Please e-mail Client Services at [schoolrel@aamc.org](mailto:schoolrel@aamc.org) when a new file is available on the FTP site, as you do now. Client Services staff will contact medical schools to resolve issues with invalid format or data for a submitted file. The guidelines listed below should be followed:

- Submit new admission actions only. Files should include only those actions which have occurred since the last reporting date.
- The file should be labeled with the code AA for admission action, the State Code, Medical School Code, and date (YYYYMMDD) Example: AA-AK850-20020131.
- No blank lines should be included.
- Actions for only one entering class year should be included in a file.
- Files should be broken into three segments:
  - One header segment (HDR) designating the number of admission action records that are enclosed in the file.
  - One or more admission action segments (ADM) designating the admission action.
  - One trailer segment (END) verifying the number of action records enclosed in the file.
- Each field within a segment must be separated by a pipe ( | ) delimiter, regardless of whether the field is populated.

### HDR Segment

This table lists the layout of the HDR segment.

Field Name	Datatype	Definition
HDR	char(3)	REQUIRED
Record Count	numeric(7,0)	REQUIRED; count of all ADM segments in the file

## ADM Segment

This table lists the layout of the HDR segment.

Field Name	Datatype	Definition
ADM	char(3)	REQUIRED
AAMD ID Number	numeric(10)	REQUIRED; AAMC Identification Number of the applicant; no leading zeros
Application Year	Date	REQUIRED; YYYY; entering class year
School Code	char(3)	REQUIRED; three digit medical school code
Social Security Number	char(9)	OPTIONAL; used for matching/quality control purposes; no hyphens or spaces
Last Name	varchar(55)	REQUIRED; legal last name
First Name	varchar(55)	REQUIRED; legal first name
Middle Name	varchar(55)	OPTIONAL; legal middle name
Action Code	char(2)	REQUIRED; valid admission action code
Action Application Type Code	char(1)	REQUIRED for MA (matriculated), OPTIONAL for AC (accepted), not expected for all other actions; program code to which applicant has been accepted or will matriculate provided by the medical school, based on REF_APPL_TYPE and REF_MED_APPL_TYPE
Campus Code	char(2)	REQUIRED for MA (matriculated), OPTIONAL for AC (accepted), not expected for all other actions; campus to which applicant has been accepted or will matriculate provided by the medical school, based on REF_MED_CAMPUS
Matriculation Date	date	REQUIRED for MA (matriculated), OPTIONAL for AC (accepted), not expected for all other actions; MM/YYYY; matriculation date provided by the medical school
Projected Graduation Date	date	REQUIRED for MA (matriculated), OPTIONAL for AC (accepted), not expected for all other actions; MM/YYYY; projected or expected graduation date provided by the medical school, default in AWS client is MATRICULATION_DATE plus 4 years; must be greater than the current calendar year

Field Name	Datatype	Definition
Timestamp	date	REQUIRED; MMDDYYYY HHMMSS; 24 hour clock (no AM/PM); the action effective date
User ID	varchar(14)	REQUIRED; the user name/ID associated with the action; can be a default value established by the medical school

### END Segment

This table lists the layout of the END segment.

Field Name	Datatype	Definition
END	char(3)	REQUIRED
Record Count	numeric(7,0)	REQUIRED; count of all ADM segments in the file

### Log File

A log file (extract report) is created when the electronic submission process is run (in either Audit or Update mode). One record will exist for each record that is written to the flat file. The data to be displayed in the log file for each record is as follows:

ID	Name	Application #	School's Decision Code	Decision Description	Decision Date
----	------	---------------	---------------------------	-------------------------	------------------

In addition, a Report Control section exists at the end of the log file. The report control section contains the following information:

- Process name
- Process release number
- Date of log file
- Term parameter
- Level parameter
- Audit/Update parameter
- Matriculation Date parameter
- Expected Graduation Date parameter
- Number of records matching the term and level
- Number of records created on the AAMCTRAN file

## AMCAS Extract File Process (SARAMXF)

Use this process to create a flat file of data to be electronically submitted to AMCAS. The AMCAS ID is placed in the flat file when the extract is run. When processing an ID, the extract first checks the `SPRIDEN_ID` field for the AMCAS ID, to ensure that the name type matches the *AMCASNTYP* rule label on SAAERUL for group code of *ADMS*. If no value is found, it then pulls the AMCAS ID from the `SABSUPL_AMCAS_ID` field on SABSUPL for the most recent application and stores it in the appropriate place in the outgoing flat file.

The AMCAS ID is placed in the flat file when the extract is run. The process will first look at the `SPRIDEN_ID` field for the AMCAS ID, ensuring that the name type code matches the *AMCASNTYP* value on SAAERUL. If no value is found in `SPRIDEN`, the process will then select the AMCAS ID from the `SABSUPL_AMCAS_ID` field on SABSUPL for the most recent application and store it in the appropriate place in the outgoing flat file.

The School Code that has been assigned to your institution by AMCAS needs be entered on the Electronic Admissions Application Rules Form (SAAERUL), with a group code of *ADMS* and a rule label of *AMCASSCHCODE*, before you run this process.

The State Code that has been assigned to your institution by AMCAS needs be entered on the Electronic Admissions Application Rules Form (SAAERUL), with a group code of *ADMS* and a rule label of *AMCASSCHSTAT*, before you run this process.

When processing an ID, the extract first checks the `SPRIDEN_ID` field for the AMCAS ID, to ensure that the name type matches the *AMCASNTYP* rule label on SAAERUL for group code of *ADMS*. If no value is found, it then pulls the AMCAS ID from the `SABSUPL_AMCAS_ID` field on SABSUPL and stores it in the appropriate place in the outgoing flat file.

## AMCAS Date Purge (SARAMDP)

This process is used if the institution has run the electronic submission process for a group of applicants (and created the flat file) but then realizes that one or more of the decision codes must be changed. In order to recreate the flat file with all the same applicants as for the previous run, you must run the purge process to delete the `SABSUPL_AGENCY_REPORT_DATE` from all SABSUPL records (date in the **Last Agency Report Date** field on the Application Supplemental Information Form (SOASUPL)) matching the IDs entered on the first run. This process may be run from either job submission or the host.

This process deletes the `SABSUPL_AGENCY_REPORT_DATE` from all records having a term and level equal to the input parameter and an existing `SABSUPL_AGENCY_REPORT_DATE` equal to the Last Electronic Submission Date parameter.

The audit report itemizes the following fields for all applications that have had their SABSUPL\_AGENCY\_REPORT\_DATE deleted:

- ID
- Name
- Term
- Level
- Application #
- The date that was deleted (i.e., the value in SABSUPL\_AGENCY\_REPORT\_DATE)

## AMCAS Views

Three Banner views are used in this process: SAVAMCD, SAVAMCT, and SAVAMC2. They require that a value exist on the Crosswalk Validation Form (GTVSDAX) for the internal code of *AMCASADDR*. This value is used to determine the priority of address type and phone type. File `safamcs.sql` contains some of the functions used to create the AMCAS views.

### Note

There are also some additional data elements (next MCAT test date and waiver information, which are also captured on SABSUPL) that are sent by AMCAS and stored in SARCHKL that are not part of the following views. ■

## SAVAMCD View

This view represents all of the demographic and prior college data submitted in an AMCAS file to an institution and loaded into Banner.

The following tables and individual data elements are accessed by this view:

### ***SPRIDEN Identification Table***

SPRIDEN\_ID  
Previous ID - uses function `f_get_spriden_prev`  
SPRIDEN\_LAST\_NAME  
SPRIDEN\_FIRST\_NAME  
SPRIDEN\_MI  
Previous Last Name - uses function `f_get_spriden_prev`

### ***SPRADDR Address Repeating Table***

Uses function `f_get_address_rowid`  
Must have GTVSDAX set up with code 'AMCASADDR'  
SPRADDR\_STREET\_LINE\_1  
SPRADDR\_CITY

SPRADDR\_STAT\_CODE  
SPRADDR\_ZIP

#### ***SPRTELE Telephone Repeating Table***

Use f\_get\_address\_telephone\_rowid (uses GTVSDAX)  
Uses function f\_get\_address\_telephone\_rowid  
Must have GTVSDAX set up with code 'AMCASADDR'  
SPRTELE\_PHONE\_AREA  
SPRTELE\_PHONE\_NUMBER

#### ***SPBPERS Basic Person Base Table***

SPBPERS\_SSN  
SPBPERS\_NAME\_SUFFIX  
SPBPERS\_SEX  
SPBPERS\_BIRTH\_DATE  
Age - uses function f\_calculate\_age

#### ***GORVISA Visa Information Table***

GORVISA\_VTYP\_CODE  
Description of Visa Type

#### ***GOREMAL E-mail Address Table***

Checks GOREMAL\_STATUS\_IND = 'A' and GOREMAL\_PREFERRED\_IND = 'Y'  
GOREMAL\_EMAIL\_ADDRESS  
GOREMAL\_DISP\_WEB\_IND

#### ***SORDEGR Prior College Degree Table***

AMCAS provides data for 6 prior colleges (PRIM, OTH1, OTH2, OTH3, OTH4, OTH5)  
Uses function f\_get\_sordegr\_rowid  
SORDEGR\_SBG\_CODE  
Prior college state code - uses function f\_get\_sobsbgi\_stat  
SORDEGR\_EGOL\_CODE  
SORDEGR\_ATTEND\_FROM  
SORDEGR\_ATTEND\_TO  
SORDEGR\_DEGC\_CODE  
SORDEGR\_DEGC\_DATE  
SORDEGR\_PRIMARY\_IND

#### ***SORMAJR Prior College Major Repeating Table***

Uses function f\_get\_sormajr\_majr  
SORMAJR\_MAJR\_CODE\_MAJOR  
Major Description

#### ***SARADAP Admissions Application Repeating Table***

SARADAP\_PIDM  
SARADAP\_TERM\_CODE\_ENTRY

SARADAP\_STYP\_CODE  
SARADAP\_CAMP\_CODE  
SARADAP\_PROGRAM\_1  
SARADAP\_COLL\_CODE\_1  
SARADAP\_LEVL\_CODE  
SARADAP\_DEGC\_CODE\_1  
SARADAP\_MAJR\_CODE\_1  
SARADAP\_ADMT\_CODE (for Early Decision)  
SARADAP\_APPL\_DATE

**SABSUPL Application Supplemental Information Base Table**

SABSUPL\_AGENCY\_FILE\_NO  
SABSUPL\_CYCLE\_ADDED  
SABSUPL\_APP\_YEAR\_AGENCY  
SABSUPL\_CYCLE\_CHANGED  
SABSUPL\_FLAG5 (Eval)  
SABSUPL\_AGENCY\_FEE\_WAIVED  
SABSUPL\_STAT\_CODE\_ADMIT  
SABSUPL\_CNTY\_CODE\_ADMIT  
County description - uses function f\_get\_desc\_fnc  
SABSUPL\_CNTY\_ADMIT\_RURAL  
SABSUPL\_NATN\_CODE\_ADMIT  
Nation description - uses function f\_get\_desc\_fnc  
SABSUPL\_STAT\_CODE\_BIRTH  
SABSUPL\_CITY\_BIRTH  
SABSUPL\_CNTY\_CODE\_BIRTH  
County description - uses function f\_get\_desc\_fnc  
SABSUPL\_CNTY\_BIRTH\_RURAL  
SABSUPL\_NATN\_CODE\_BIRTH  
Nation description - uses function f\_get\_desc\_fnc  
SABSUPL\_NUMBER\_DEPS  
SABSUPL\_ETHN\_CODE\_SELF  
Ethnic code description - uses f\_get\_desc\_fnc  
SABSUPL\_ESEL\_CODE (minority app)  
SABSUPL\_FLAG1 (military service)  
SABSUPL\_FLAG2 (prev med student)  
SABSUPL\_FLAG3 (disciplinary action)  
SABSUPL\_FLAG4 (adv\_info\_release)  
SABSUPL\_PREV\_APP\_1  
SABSUPL\_PREV\_APP\_2  
SABSUPL\_PREV\_APP\_3  
SABSUPL\_PREV\_APP\_4

## **SAVAMCT View**

This view represents all of the MCAT test score, course hours, and GPA data submitted in an AMCAS file to an institution and loaded into Banner. There are multiple rows for each person for each application - one row for each test score, course hour, or GPA.

The following tables and data elements are accessed by this view.

### ***SPRIDEN Identification Table***

SPRIDEN\_ID  
Previous ID - uses function f\_get\_spriden\_prev  
SPRIDEN\_LAST\_NAME  
SPRIDEN\_FIRST\_NAME  
SPRIDEN\_MI  
Previous Last Name - uses function f\_get\_spriden\_prev

### ***SARADAP Admissions Application Table***

SARADAP\_PIDM  
SARADAP\_TERM\_CODE\_ENTRY  
SARADAP\_STYP\_CODE  
SARADAP\_CAMP\_CODE  
SARADAP\_PROGRAM\_1  
SARADAP\_COLL\_CODE\_1  
SARADAP\_LEVL\_CODE  
SARADAP\_DEGC\_CODE\_1  
SARADAP\_MAJR\_CODE\_1  
SARADAP\_ADMT\_CODE (for Early Decision)  
SARADAP\_APPL\_DATE

### ***SARERUL Electronic Admissions Application Rules Table***

SARERUL\_EGRP\_CODE  
SARERUL\_DESC  
SARERUL\_VALUE

### ***STVEGRP EDI Rule Group Validation Table***

STVEGRP\_CODE  
STVEGRP\_DESC

### ***SORTEST Test Score Table***

Uses SARERUL\_EGRP\_CODE = 'ATST'  
Group code and description  
SORTEST\_TESC\_CODE  
Test code description  
SORTEST\_TEST\_SCORE  
SORTEST\_TEST\_DATE  
SORTEST\_TEFR\_CODE  
SORTEST\_TEIN\_CODE

SORTEST\_RELEASE\_IND  
SORTEST\_TEAC\_CODE  
SORTEST\_INSTR\_ID

### ***SORCRSS Person Course Summary Types Table***

Uses SARERUL\_EGRP\_CODE = 'ACHR'  
Group code and description  
SORCRSS\_CRSS\_CODE  
Course code description  
SORCRSS\_HOURS  
SORCRSS\_SBG\_CODE = '999999'

### ***SORGPAT Person GPA Types Table***

Uses SARERUL\_EGRP\_CODE = 'AGPA'  
Group code and description  
SORGPAT\_GPAT\_CODE  
GPA code description  
SORGPAT\_GPA  
SORGPAT\_PLUS\_MINUS\_IND  
SORGPAT\_SBG\_CODE = '999999'

### ***SAVAMC2 View***

This view contains all the data that must be returned to AMCAS as part of the Admissions Action File and is used by the AMCAS Extract File Process (SARAMXF).

The following tables and fields are accessed by this view.

### ***SPRIDEN Identification Table***

SPRIDEN\_PIDM  
SPRIDEN\_ID  
SPRIDEN\_LAST\_NAME  
SPRIDEN\_FIRST\_NAME  
SPRIDEN\_MI  
Name code for AMCAS file - uses function f\_get\_name\_code

### ***SARADAP Admissions Application Table***

SARADAP\_TERM\_CODE\_ENTRY  
SARADAP\_LEVL\_CODE  
SARADAP\_APPL\_NO

### ***SARAPPD Application Decision Table***

SARAPPD\_APDC\_DATE  
SARAPPD\_APDC\_CODE - translated via SORXREF  
SARAPPD\_SEQ\_NO

### **SBSUPL Admissions Supplemental Data Table**

SBSUPL\_AGENCY\_REPORT\_DATE  
SBSUPL\_AMCAS\_ID

### **SORXREF Cross-reference Rules Table**

SORXREF\_EDI\_VALUE  
SORXREF\_EDI\_QLFR (like 'AMCAS%')  
SORXREF\_XLBL\_XODE (= 'STVAPDC')

## Selective Admissions - Communication Load and Removal

### Overview

The Communication Load Process (SURLOAD) is used to insert records into GURMAIL using a flat file of PIDMS as input. The process inserts a record with a minimum of PIDM, System Indicator, and Activity Date.

The process also provides you with the option of inserting additional data elements into the GURMAIL record via the input parameters (i.e., Letter Code, Material Code, Initials, etc.). In addition, the Communication Removal Process (SURDELTA) is used to purge records from GURMAIL based on certain input parameters.

SURLOAD allows schools to track any mailings to students that take place outside the realm of communication plan processing and/or letter generation, using the Student Mail Form (SUAMAIL).

### Communication Load Process (SURLOAD)

This process takes a flat file of PIDMS as input, from which it inserts new records into the GURMAIL table. This process can be run from either job submission (GJAPCTL) or the host.

The process first determines whether any of the PIDMS in the input file are invalid Banner PIDMS (i.e., they don't exist in SPRIDEN). If a PIDM does not currently exist in Banner, that record is bypassed and noted in the audit log file. The PIDM, System Indicator (i.e., S = Banner Student, H = Banner Human Resources, R = Banner Financial Aid, etc.), and Activity Date (the date the file of PIDMS is loaded into GURMAIL) are all required. In addition, the process sets the User field on GURMAIL to *SURLOAD* for all records loaded via this process.

The GURMAIL\_DATE\_INIT is automatically set to the GURMAIL\_ACTIVITY\_DATE, indicating the day the record is inserted into GURMAIL. The GURMAIL\_INIT\_DATE will *not* change from this point forward, while the GURMAIL\_ACTIVITY\_DATE may change if the record is updated.

Use Parameter Definition Form (GJAPDEF) to change any of the optional SURLOAD parameters to required parameters at your institution. The SURLOAD process also checks to ensure that duplicate rule processing is followed if a record with the same material and/or letter code is already found in GURMAIL for the same PIDM.

## Log File

A log file is created that identifies each record loaded into GURMAIL, as well as indicating those records which were not loaded and why (no PIDM exists in Banner, duplicate letter, etc.). The log file also includes a count of how many records were actually loaded into GURMAIL. In addition, the log file displays all of the input parameters to the SURLOAD process as well as the system date. The following fields will be displayed for each record in the log file:

- ID
- Name
- System Indicator
- Comment (indicating why a record hasn't been loaded into GURMAIL)

## Communication Removal Process (SURDELT)

This process allows for the mass delete of SUAMAIL records. This process may be run from either job submission (GJAPCTL) or from the host.

The input parameters for the delete process are similar to those used by the SURLOAD process, except that the purge process also allows for the deletion of SUAMAIL records that were not created by the SURLOAD process (i.e., user is not equal to SURLOAD).

## Log File

A log file is created which identifies all records deleted by the purge process. The log file contains the following fields:

- ID
- Name
- System Indicator
- Value of all parameters entered

# Selective Admissions - Secondary School Tracking

## Overview

Secondary school tracking allows institutions to summarize data by high school or prior college for the following groups of people:

- Prospect – must have an SRBRECR record.
- Applicant – must have a SARADAP record.
- Accepted Applicant – must have a SARAPPD record with a decision code having the **Significant Decision** and **Institution Acceptance** flags checked.
- Confirmed – must have a SARAPPD record with a decision code having the **Significant Decision** and **Applicant Acceptance** flags checked.

Secondary school tracking allows institutions to quickly assess their success rate over time at various high schools and colleges from which they receive prospects and applicants. They can then use this information for a variety of purposes, including setting travel schedules for the following years, planning special visits to certain high schools or colleges to increase yield, etc.

- The Source/Background Institution Summary View (SOVSBGI) is used to calculate the summary data for each high school as a person moves from prospect, applicant, and accepted applicant to confirmed applicant. This process includes any person loaded via any tape or Web load process.
- The Prior College Summary View (SOVPSCM) is used to calculate the summary data for each college as a person moves from prospect, applicant, and accepted applicant to confirmed applicant. This process includes any person loaded via any tape or Web load process.
- The Source/Background Institution Summary Form (SOASBSM) is used to display the high school summary information calculated by the view for a specific source/background institution (STVSBGI) code, term, level, campus, college, program, major, and student type for as many years of data as exist in Banner.
- The Prior College Enrollment Summary Form (SOAPCSM) is used to display the prior college summary information calculated by the view for a specific source/background institution (STVSBGI) code, term, level, campus, college, program, major, and student type for as many years of data as exist in Banner.
- The Source/Background Summary Report (SORSBSM) is used to collect high school summary information like what is displayed on SOASBSM.
- The Prior College Summary Report (SORPCSM) is used to collect prior college summary information like what is displayed on SOAPCSM.

## Source/Background Institution Summary Form (SOASBSM)

This form is used to call a view that generates the high school data to be displayed. The view calculates the percentages for the appropriate fields. The form is entered in query mode.

The Key Block contains a source/background institution code, which is required.

The Source/Background Institution Summary Block contains the summary information for the institution in the key, such as a term code, a level code, a campus code, a college code, a program code, a major code, and a student type code, which are optional. The fields in this block are queryable.

If the term code is left blank, then the form displays all pertinent data for the source/background institution code in the key for all available terms beginning with the most current term. If the term code is entered, the form displays all pertinent information for that term only.

At the bottom of the window, the totals for the query are listed by number of prospects, number of applicants, number of applicants accepted, and number of student confirmations.

## Prior College Enrollment Summary Form (SOAPCSM)

This form calls a view that generates the prior college data to be displayed. The view calculates the percentages for the appropriate fields. The form is entered in query mode.

The Key Block contains a source/background institution code, which is required.

The Source/Background Institution Summary Block contains the summary information for the institution in the key, such as a term code, a level code, a campus code, a college code, a program code, a major code, and a student type code, which are optional. The fields in this block are queryable.

If the term code is left blank, then the form displays all pertinent data for the source/background institution code in the key for all available terms beginning with the most current term. If the term code is entered, the form displays all pertinent information for that term only.

At the bottom of the window, the totals for the query are listed by number of prospects, number of applicants, number of applicants accepted, and number of student confirmations.

## Source/Background Summary Report (SORBSM)

Use this report to collect high school information similar to what is found on the Source/Background Institution Summary Form (SOASBSM).

## Prior College Summary Report (SORPCSM)

Use this report to collect prior college summary information similar to what is found on the Prior College Enrollment Summary Form (SOAPCSM).

## Source/Background Institution Summary View (SOVSBGI)

This view is run every time the Source/Background Institution Summary Form (SOASBSM) is accessed. The view uses the source/background institution code value in the Key Block of SOASBSM to select its high school records. The **Source or Background Institution** field is required.

The view collects the following values for either all terms (if the **Term** field is blank) or for the term indicated and all prior terms:

- Class Size

The number of seniors, obtained from SORBDMO\_NO\_OF\_SENIORS on SOABGIY if available for the correct year.

### Note

If no value exists in this field for the correct year, the program will try to use the **Class Size** field (SORHSCH\_CLASS\_SIZE) on SOAHSCH for any ID selected in the query. Regardless of which class size field is used, the **Graduation Date** field (SORHSCH\_GRADUATION\_DATE) must be filled in. ■

- Number of Prospects

The number of SRBRECR records that have an associated SOAHSCH record whose source/background institution code matches the one in the key or match the entered criteria.

- Number of Applications

The number of SARADAP records that have an associated SOAHSCH record whose source/background institution code matches the one in the key or match the entered criteria.

- Application Rate (Number of Applications/Class Size)

Take the number of applications and divide by the class size.

- Number Accepted

The number of SARAPPD records that have the significant decision code and the institutional accept code checked and that have an associated SOAHSCH record whose source/background institution code matches the one in the key or match the entered criteria.

- Acceptance Rate (Number Accepted/Number of Applications)

Take the number of accepted applicants and divide by the number of applications.

- Number Confirmed

The number of SARAPPD records that have the significant decision code and the applicant accept code checked and that have an associated SOAHSCH record whose source/background institution code matches the one in the key or match the entered criteria.

- Confirmation rate (Number confirmed/Number Accepted)

Take the number of confirmed applicants and divide by the number of accepted applicants.

## Prior College Summary View (SOVPSCM)

This view is run every time the Prior College Enrollment Summary Form (SOAPCSM) is accessed. The view uses the source/background institution code value in the Key Block of SOASBSM to select its prior college records. The **Source or Background Institution** field is required.

The view collects the following values for either all terms (if the **Term** field is blank) or for the term indicated and all prior terms:

- Number of Prospects

The number of SRBRECR records that have an associated SOAPCOL record whose source/background institution code matches the one in the key or match the entered criteria.

- Number of Applications

The number of SARADAP records that have an associated SOAPCOL record whose source/background institution code matches the one in the key or match the entered criteria.

- Application Rate (Number of Applications/Class Size)

Take the number of applications and divide by the class size.

- Number Accepted

The number of SARAPPD records that have the significant decision code and the institutional accept code checked and that have an associated SOAPCOL record whose source/background institution code matches the one in the key or match the entered criteria.

- Acceptance Rate (Number Accepted/Number of Applications)

Take the number of accepted applicants and divide by the number of applications.

- Number Confirmed

The number of SARAPPD records that have the significant decision code and the applicant accept code checked and that have an associated SOAPCOL record

whose source/background institution code matches the one in the key or match the entered criteria.

Students are added to this counter if they have the decision code that is entered in the **External Code** field of the GTVSDAX record with an **Internal Code** of DEPOPAID and a **Group (Code)** of DEPOSIT.

- Confirmation Rate (Number Confirmed/Number Accepted)

Take the number of confirmed applicants and divide by the number of accepted applicants.

## Selective Admissions - Admissions Rating/Batch Entry

### Overview

The Admissions Rating Form (SAARRAT) allows for the input of multiple ratings (of multiple types), as well as producing total and average ratings by ID. The form also displays basic application information for the applicant being rated.

The Admissions Rating Type Rules Form (SAARRCT) allows each institution to define minimum and maximum values for each rating type. The rules form also allows institutions to "assign" rating types to administrators. This can reduce batch entry as well as data entry on the SAARRAT, as the assigned rating types will default in, if that administrative ID and role are entered in the key.

The Admissions Decision and Rating Batch Entry Form (SAADCBT) allows you to enter an admission decision code for multiple students at one time. In addition, the form allows for the input of multiple ratings for multiple students at one time.

Use the Admission Purge Process (SAPADMS) to purge the new applicant admissions rating data in the SARRRAT table as part of the application record purge.

### Admissions Rating Type Validation Form (STVRATP)

Use this form to define codes that identify all the types of ratings an institution might use. Possible examples include ratings for different application forms, personal ratings, academic ratings, athletic ratings, art or music ratings, etc. The rating type "0000 - Admissions Rating" is system-required.

### Admissions Rating Type Rules Form (SAARRCT)

Institutions should use this form to define and tailor each type of rating to meet their individual needs. The data contained in this form is stored in the Admissions Rating Table (SARRRCT). All rating types to be used must be defined in the Term Rating Type Rules block. Use of the Administrator Rating Type Rules block is optional.

## Admissions Rating Form (SAARRAT)

Use the Admissions Rating Form (SAARRAT) to enter multiple rating types and associated ratings per individual ID.

## Admissions Decision and Rating Batch Entry Form (SAADCBT)

Institutions should use this form to group their applications in multiple ways and then enter decisions for those groups all at once. In addition, the form allows institutions to enter ratings for the applications receiving a decision code or to enter only ratings for multiple IDs. All fields in the Key Block are optional.

### Note

For more information on SAARRCT, SAARAT, and SAADCBT, please see the online help for these forms. ■

## Admissions Decision Form (SAADCRV)

Use the Rating Review window on this form to review rating types and ratings for the ID and admissions application in the main window. This window is accessed from the Decision Calculator window, using the Rating Review item in the Options Menu.

## Admissions Decision Rules Form (SAADCSN)

Use the Ratings window on this form to track and consider the new ratings entered on either SAARRAT or SAADCBT as additional criteria in the automated decision process. Use the Admission Rating Type Rules item in the Options Menu in the main window to access the Ratings window.

## Rating Audit Report (SARDCBT)

Use this report to view all applications updated by the Admissions Decision and Rating Batch Entry Form (SAADCBT) for a specific date. The report displays the following fields for each ID that matches the input parameters:

- ID/SSN
- Name
- High School
- Term Code
- Application number
- Application Type
- Level

- Campus
- Degree
- Major
- Program
- Subtotal of # of decisions for that particular decision code.

In addition, the control section at the end of the report details the parameters that were entered. The control section also indicates the total number of decisions (matching the input parameters) entered on that date.

## Admission Decision Criteria Report (SARDCSN)

This report details the various decision rules entered on SAADCSN for various terms depending on the parameters entered. Use this report to consider rating data entered on SAADCSN in the Ratings window.

## Admit Decision Calculation Report (SARBDSN)

Use this report to consider the data entered in the Ratings window on SAADCSN when calculating an automatic decision.

## Admissions Purge Process (SAPADMS)

Use the Admission Purge Process (SAPADMS) to purge the new applicant admissions rating data in the SARRRAT table as part of the application record purge.

## Tape Load and Match Processing

Please see the “Tape Load and Match Processing” section in the “Recruiting” chapter procedures for this information.

## Selective Admissions - Search and Test Score Tape Load

Please see the “Search and Test Score Tape Load” section in the “Recruiting” chapter procedures for this information.

# Selective Admissions - Regionalization

## Overview

Regionalization processing allows you to do the following:

- Assign a district/region/EPS market code to a person, based on rules using the person's address, high school address, or high school source/background institution code (STVSBGI), even if the person is created via the tape load process.
- Assign a district/region/EPS market code to a high school based on the high school's address, even if the person is created via the tape load process.
- Store and override the system-assigned geographic region/division codes.
- Build rules on the Material Form (SOAMATL) to use the district/region/EPS market code in the determination of communication plan materials.
- Assign a specific administrator by term to a person or institution, based on the district/region/EPS market code.

## Overall Process Flow

This processing is used to assign people and institutions to various geographic regions. Multiple geographic regions can be assigned to an individual or to an institution. Multiple administrative roles such as recruiter, reader, etc. can be assigned to the same person or to an institution. Geographic region codes assigned to people and/or institutions can be manually updated or overridden. The geographic regions of individuals and institutions and institutional EPS Market Codes can be used when creating the rules for material creation. Historical data on which region(s) a person or institution has belonged to is maintained.

1. Use the Geographic Region Rule Form (SOAGEOR) to define all region and division combinations and rules.
2. If you have purchased Enrollment Planning Service (EPS) codes, load them into the Enrollment Planning Service Code Validation Form (STVEPSC) for use on the Enrollment Planning Service Rules Form (SOAEPSC).
3. Determine what your administrative roles are (recruiter, reader, traveler, alumni rep, etc.) on the Administrative Role Code Validation Form (STVRADM).
4. Set up the rules you want to use to assign your administrators on the Administrator Role Rules Form (SOAADAS).
5. As addresses for recruits and applicants are entered on the General Person Identification Form (SPAIDEN), a database trigger creates a record for that address in the GORCGEO collector table. A record is only created in the collector table if a record exists on the Crosswalk Validation Form (GTVSDAX) having an Internal

Code of "Region" with the same address type. The collector table record is used by the Person Geo Region/Divisions Report (GORPGEO) to create region records for that address in the GORPGEO table. These records can be viewed on the Geographic Regions/Divisions by ID Form (GOAPGEO). In addition, as high school addresses are entered in Banner, the SBGI Geo Region/Divisions Report (GORSGEO) is used to create region records for high schools on the new Source/Background Institution Geographic Form (GOASGEO).

6. Use the Assigned Administrators window in the Recruit Prospect Information Form (SRARECR), the Quick Recruit Form (SRAQUIK), and the Admissions Application Form (SAAADMS) to view and update the administrator assignments using the region data in GORPGEO and GORSGEO and the rules on the Administrative Roles Rules Form (SOAADAS). This window is accessed through the Options Menu.

Or, you can run the SORAINF process to assign administrators using the region data in the GORPGEO and GORSGEO tables and the rules on the Administrator Role Rules Form (SOAADAS).

7. Use the SAVSGEO and SAVADAS1 views to see which institutions are assigned to administrators. These views use the data in the GORPGEO, GORSGEO, and SORAROL tables and allow you to run various queries to determine which administrators have been assigned to individual institutions, as well as to all institutions within a region.

## Administrative Role Code Validation Form (STVRADM)

This validation form allows institutions to define various types of administrator roles to be used with regionalization processing. Examples of such roles are: Recruiter, Reader, Alumni Recruiter, etc. These codes are used by the Administrator Role Rules Form (SOAADAS) and the Administrator's Assignments Form (SOAAINF).

The **Rater Indicator** checkbox is used to designate that a role can assign ratings on the Admissions Rating Form (SAARRAT) and the Admissions Decision and Rating Batch Entry Form (SAADCBT) when checked.

## Enrollment Planning Service Code Validation Form (STVEPSC)

This validation form can contain all 304 EPS Market codes created by the College Board along with their corresponding market names. This validation form must be populated by the institution with all the EPS codes and descriptions available from the College Board.

## Administrator Assignment Data Element Validation Form (STVADDA)

This validation form is used to define the various data elements that may be used to assign administrators on the Administrator Role Rules Form (SOAADAS). The data for this

table is provided by SunGard Higher Education. Programming logic is built into each of the delivered data elements.

 **Note**

If new data elements are needed, they will be inserted into this table, and the stored procedure to calculate the assignments will be modified to include the new data elements. ■

The **Sys(tem) Req(uires)** checkbox is used to determine which values are required by the system. If the **Sys(tem) Req(uires)** checkbox is checked, the validation table record cannot be deleted.

## Administrator Role Rules Form (SOAADAS)

This form allows you to define a combination of rules to be used in assigning different administrators (recruiter, reader, alumni recruiter, etc.) to high school and person records. The form also allows institutions to use many fields available within Banner to determine how a specific administrative role should be assigned. Examples of fields which are included are: college code, campus, level, home address state, EPS market code, geographic region code, high school code, degree, program, ethnicity, gender, etc.

The form can be entered in query mode, allowing you to see which rules have been defined for the administrator ID in the key. If the **Role** is entered in the key, only rules matching this field are displayed. If an **Effective Term** is entered in the key, all rules for that effective term and earlier are displayed. If the **Active Only** checkbox is checked, only active rules for this administrator ID are displayed.

To create a new rule for the administrator ID in the key, enter the appropriate effective term and role for the new rule in the Rule Definitions block. The system automatically creates the rule number once the new rule assignments have been saved.

Access the Assignment Rules block, and define the specific elements that govern the new rule. The fields that are available have been predefined in the Administrator Assignment Data Element Validation Form (STVADDA). The logic is an OR condition within like data elements and an AND condition between different data elements. If more than one rule ID exists for an administrator/role combination, OR logic is used between the rules.

Rules can be inactivated by unchecking the **Active** checkbox in the Rule Definitions block. Only rules that are active can be modified in the Assignment Rules block.

Use List from the **Data Element** field to see the Administrator Assignment Data Element Codes List of Values.

The **Operator** field can be set to either "=" equal or "<>" not equal.

Use List from the **From Value** field to assign the appropriate value for the corresponding data element. You may designate a range of values for a data element using List from the **To Value** field, for example a ZIP Code range of 06000 to 06599.

## Enrollment Planning Service Rules Form (SOAEPSC)

This form allows you to set up rules for each EPS code by state, ZIP/Postal Code, county, or city. Only the **State/Province** field is required. These rules are for specific region criteria and apply only to high school addresses.

## Administrator Assignment Search Form (SOIAROL)

Use this form to query on roles and IDs from the Administrator Role Rules Form (SOAADAS).

This form is accessed by using Count Query Hits from the **ID** or **Role** fields in the Key Information of SOAADAS or SOAAINF, or you may display the Option List from the **ID** or **Role** fields and then select Admin Assign Search Form (SOIAROL).

## Administrator's Assignments Form (SOAAINF)

This form displays the IDs and names of everyone assigned to the administrator/role combination identified in the Key Information.

For example, if Russell Jones is a recruiter for SunGard Higher Education University, and using the Administrator Role Rules Form (SOAADAS) he was assigned as the recruiter for all high schools in Michigan, then SOAAINF would display all IDs having recruiting records which had been entered into Banner for a specific term, that had associated high schools with an address in Michigan. The form obtains this information by querying the SORAROL table for the administrator ID, role, and term in the key.

Use the Remember ID item in the Options Menu to carry one of the IDs to another form.

### **Assign Administrator Window**

Use the Assign Student item in the Options Menu to access the Assign Administrator window. This window is used to view and assign an administrator to the person in this window's **ID** field. The administrator who is assigned is the ID in the key of the main window.

## Administrator Role Form (SOAAROL)

This form is used to display all the administrative roles assigned to the ID in the Key Information. Since individuals can hold more than one type of administrative role, this form allows you to see all the roles that have been assigned to different individuals. This form is populated with data from the SORAROL table.

## Source/Background Institution Geographic Form (GOASGEO)

This form is used to display the geographic regions assigned to a source/background institution based on its address. You can also access this form from the Source or Background Institution Base Form (SOASBGI), the High School Information Form (SOAHSCH), and the Prior College Form (SOAPCOL). This form is populated with data from the GORSGEO table.

A record with the **System Indicator** checkbox checked can be made inactive, but no other fields can be altered. If a record is entered by the user, the **System Indicator** checkbox remains unchecked.

## Geographic Regions/Divisions by ID Form (GOAPGEO)

This form is used to display the geographic regions assigned to an ID based on its addresses. Regions can be active or inactive. GOAPGEO is populated with data from the GORPGEO table.

A record with the **System (Indicator)** checkbox checked can be made inactive, but no other fields can be altered. If a record is entered by the user, the **System (Indicator)** checkbox remains unchecked.

## Administrator Assignments Process (SORAINF)

This process allows institutions to use the rules defined on the Administrator Role Rules Form (SOAADAS) to assign administrators to recruit and applicant records. The process populates the SORAINF table. This process also runs when the Assign Administrators item in the Options Menu is selected on the Assigned Administrators window on the Recruit Prospect Information Form (SRARECR), the Quick Recruit Form (SRAQUIK), the Admissions Application Form (SAAADMS), and the Administrator's Assignments Form (SOAAINF).

## Person Geo Region/Divisions Report (GORPGEO)

This process is used to assign regions to individuals using the data in the GORCGEO collector table in combination with the rules defined on the Geographic Region Rules Form (SOAGEOR). These regions are then stored in the GORPGEO table.

## SBGI Geo Region/Divisions Report (GORSGEO)

This process is used to assign regions to high schools using the high school address in combination with the region rules set up on SOAGEOR. These high school regions are then stored in the GORSGEO table.

## High School/College Administrator Assignments View (SAVADAS1)

This view is used to show the source/background institutions assigned to administrators.

### Selective Admissions - Process Geographic Regions, Administrators, and Ratings

The following steps are used to set up geographic regions, assign administrators, and define ratings calculations.

1. Create geographical region definitions.

Create geographic regions on the Geographic Region Rules Form (SOAGEOR). Regions are defined using a combination of division and region.

For example, to create a region associated with the recruits Donna Harrison will be working with, create a region called *DHARISSON* and a division called Recruits. Or, if a school defines their regions geographically, create a region for *NEWENGLAND* and a division of Recruiting.

The use of the **Region** and **Division** fields is arbitrary. The fields can be defined for whatever you need to use them for.

2. Set up GTVSDAX address type records.

Use the entries on the Crosswalk Validation Form (GTVSDAX) to determine which address types will cause the trigger on SPRADDR to create entries in the Geo-Region Collector Table (GORCGEO). The records in this collector table will also be used in a later step to assign geographic regions to persons, based on the regions set up previously on SOAGEOR.

Create entries on GTVSDAX for the **Internal Code** of *REGION*. When the **Internal Code** field has a value of *REGION*, the **Group Code** field must use a value of *REGION ADDRESS* in order for region processing to work. Use the **External Code** field for those entries to define which address types should cause the trigger to run. This allows institutions to only have the trigger run when certain address types are entered on SPAIDEN, thus allowing other offices (i.e., Alumni) that enter addresses to use a different address type without having the trigger run. The trigger causes a record to be created in the Geo-Region Collector Table (GORCGEO) for each address entered on SPAIDEN with an address type matching one set up on GTVSDAX.

3. Define administrator roles.

Create role codes on the Administrative Role Code Validation Form (STVRADM) that define the different roles your administrators might play (i.e., reader, Alumni interviewer, rater, etc.). If a role is allowed to assign ratings, check the **Rater Indicator** checkbox for that role.

Consider creating a *GENERIC* role code for use in conjunction with the Admissions Rating Calculation Process (SARRATE). This process assigns ratings in batch to records meeting the specified criteria. This role must have the **Rater Indicator** box checked if it is to be used to automatically assign ratings.

4. Create administrator(s).

Create Banner records on the Identification Form (SPAIDEN) for each person who will be functioning as an administrator. Consider creating a *GENERIC* administrator ID to use in conjunction with the Admissions Rating Calculation Process (SARRATE).

5. Assign roles to administrators.

Assign all appropriate role(s) to each administrator on the Administrator Role Form (SOAAROL). If you are using a generic administrator and role with the Admissions Rating Calculation Process (SARRATE), the role must be assigned to the administrator ID on this form.

6. Set up rules to assign administrators.

Set up rules to assign an administrator to a group of recruits or applicants using the Administrator Role Rules Form (SOAADAS). Multiple rules can be set up for each administrator, thereby increasing the complexity of the assignment. If the same data element is listed multiple times for a rule, then an *OR* condition exists between each record. An *AND* condition exists between non-like data element rows.

For example:

```
SARADAP_TERM_CODE_ENTRY = 200310  
SARADAP_MAJR_CODE_1 = ART  
SARADAP_MAJR_CODE_1 = MATH
```

This indicates you want to assign this administrator to all applicants who have an entry term code of 200310 *AND* who have applied to be an Art major *OR* a Math major.

If you are planning to use the Admissions Rating Calculation Process (SARRATE) in conjunction with a *GENERIC* administrator ID, ensure that one of the rules set up on SOAADAS assigns that administrator/role combination to all persons who might be affected by the SARRATE process.

7. Create rating types.

Create rating type codes on the Admissions Rating Type Validation Form (STVRATP). Examples of rating types could be: Academic 1, Personal Interview, Art Portfolio, etc.

**8.** Define ratings types, and optionally assign them to administrators.

Define rating types for given effective terms using the Admissions Rating Type Rules Form (SAARRCT). In addition, define the minimum and maximum values allowed for each rating type.

Optionally, you can also assign rating types to administrators using SAARRCT. This reduces the amount of data entry for the administrator when they enter ratings on SAARRAT, but it does not restrict administrators to only entering ratings for these rating types.

**9.** Define test score equivalencies.

Define any test score equivalencies that may be used in the rating process on the Test Score Equivalency Form (SOATEQU). In order to use test score equivalencies, a test source must be identified on SOATEQU and must accompany the incoming test score. This allows institutions to limit the creation of equivalencies to official test scores versus self-reported test scores.

**10.** Define factor codes.

Define factor codes (to be used in setting up rating formulas) on the Admissions Factor Code Validation Form (STVAFCT). Each factor code acts as a variable in the user-defined rating formula. Factor codes are only needed if you are planning to calculate ratings with a user-defined formula.

**11.** Define selection criteria for factor codes.

Associate factor codes with selection criteria, and assign them to Banner fields using the Admissions Rating Factor Rules Form (SAARRFT). The selection criteria define the characteristics the applicant must have in order for the rating formula to use this factor code. For example, a factor code could be defined as valid for all applicants with a major code equal to Math who are in-state residents.

The factor codes are then assigned either a static value such as *10*, or they are assigned to a Banner column. For example, if the rating formula requires the SAT Verbal score, then a factor code could be associated with a **Table Name** value of *SORTEST*, a **Select Column** value of *SORTEST\_TEST\_SCORE*, and a **Where Column** value of *SORTEST\_TESC\_CODE = S01* (the test code for the SAT Verbal score).

Selection criteria for factor codes are only needed if you are planning to calculate ratings with a user-defined formula.

**12.** Define the rating calculation formula.

Define the rating calculation formula on the Admissions Rating Formula Definition Form (SAARRDF). This form uses the factor codes created on SAARRFT in conjunction with parentheses and numeric operators to create a user-defined formula. Each user-defined formula is defined for a rating type and effective term. The rating

calculation formula is only needed if you want to create and assign ratings based on a user-defined formula.

The set up for using geographic regions, administrators, and ratings is complete. You can now create your recruit and/or applicant records in Banner, including their address records, which will cause the Geo-Region Collector Table (GORCGEO) to be populated. Additional information required by the user-defined formula (such as test scores, etc.) should be entered where appropriate in your process.

**13. Assign regions to records.**

Run the Person Geo Regions/Divisions Process (GORPGEO) to assign regions to all records in the Geo-Region Collector Table (GORCGEO). This process can also be run for a single ID within the Geo-Region Collector Table (GORCGEO).

**14. View assigned region(s)/division(s).**

Use the Geographic Regions/Divisions by ID Form (GOAPGEO) to view the geographic regions assigned to each person. Each record also includes information about the address that caused the creation of the geographic region.

**15. Assign administrators.**

Run the Administrator Assignments Process (SORAINF) to assign administrators to recruits and applicants based on the rules set up on SOAADAS. Use the Administrator's Assignments Form (SOAINF) to view all recruits or applicants assigned to an administrator manually or via the SORAINF process.

Use the Administrator Assignments item in the Options Menu from SAAADMS or SRARECR for a specific recruit or applicant to view the administrator(s) assigned to the specific recruit or applicant.

**16. Assign ratings.**

Now that administrators have been assigned to recruits and applicants, they can assign rating(s) to your applicants on the Admissions Rating Form (SAARRAT). Rating types that were pre-defined for each administrator will default into SAARRAT as long as the administrator/role information is entered in the Key Block. The administrator then needs to only enter the rating itself.

**17. Run batch rating process.**

If your institution has created a user-defined formula on the Admissions Rating Formula Definition Form (SAARRDF) to assign ratings, run the Admissions Rating Calculation Process (SARRATE) to calculate the ratings based on the formula and to insert the rating into SARRAT for each applicant that met the criteria.

Other options:

1. Enter ratings on the Admissions Decision and Rating Batch Entry Form (SAADCBT). This form allows you to enter decisions and/or ratings in batch. As on SAARRAT, rating types defined for an administrator on SAARRCT will default into the form if the administrator and role information is entered in the Key Block.
2. Ratings can also be used with the auto-decision process. Enter rating minimum and maximum values on the Admissions Decision Rules Form (SAADCSN) as part of auto-decision processing.

## Purge Process

The following purge is part of the Admissions module.

### sapadms.pc - Admissions Purge

This process will purge all admissions information for a student based on the user specified parameter of term. The term entered represents the terms up to and including the term for which you would like to purge admissions data. The user may optionally choose to delete High School, Prior College, and Test Score information by parameter selection. The Transfer Articulation information for the applicant will also be deleted if no General Student information exists, or it *may bypass* those students with registration and/or academic history. The process will only delete the mail records which are tied to the Admissions module. This process will also delete person-related information such as interests and contacts, if no recruiting or student record exists for the applicant.

## Admissions Reports

---

This section contains a sample of each report in the Admissions module. Parameter definitions are also provided for your convenience.

The following reports are run through the Admissions module:

Admissions Count by College/Major Report	(SARACTM)
Admissions Application Report	(SARADMS)
Admit Decision Calculation Report	(SARBDSN)
Admission Decision Criteria Report	(SARDCSN)
Admissions High School Report	(SORHSRP)
Admission Purge	(SAPADMS)
Appointment Purge Process	(SOPAPPT)
SAT Recentering Process	(SOPSATS)
AMCAS Extract File Process	(SARAMXF)

AMCAS Date Purge	(SARAMDP)
Communication Load Process	(SURLOAD)
Communication Removal Process	(SURDELT)
Source/Background Summary Report	(SORSBSM)
Rating Audit Report	(SARDCBT)
Administrator Assignments Process	(SORAINF)
Electronic App Purge Process	(SARETPG)
Elec App Verify/Load Process	(SARETMT)
TS 189 Upload to Banner	(SAR189U)
Student Email Process	(SOREMAL)
Batch Email for Elec. Apps. Process	(SAREMAL)
Admissions Rating Calculation Report	(SARRATE)
Electronic Application Report	(SARETBL)
Learner Curriculum Conversion Process	(SOPLCCV)
Learner Curriculum Purge Process	(SOPLCPG)
Non-Destructive Curric Update Report	(SOPLCHG)
Process Mass Entry Report	(SORMEBP)
Purge Mass Entry Audit Process	(SOPMAUD)

## Creating a Population Selection

To perform population selection, the application you will be working with must first be defined on the Application Definition Rules Form (GLRAPPL).

The second step is to enter the Population Selection Definition Rules Form (GLRSLCT), enter the **Application (Code)**, and create a **Selection ID (Identifier)** with a description.

In the Selection Definition section, define the **Select** and **From** portions of the SQL statement that the selection represents.

### **Example:**

```
Select:      SARADAP_PIDM
From:       SARADAP
```

Next, enter the Selection Rules for the population of records you would like to see.

### **Example:**

```
SARADAP_TERM_CODE_ENTRY    =    '200010'        AND
SARADAP_LEVL_CODE          =    'UG'
```

Save your data and exit. Your population selection rules will be compiled. If any errors are issued during the compilation process, resolve the errors before continuing. If you do

not resolve all errors given during the compile process, you will not be able to use the population selection rules to extract a population.

You are now ready to extract the population of people. The Population Selection Extract (GLBDATA) is run from the Process Submission Control Form (GJAPCTL). At minimum, you will need to supply the parameters for Selection Identifier 1, Application, and Creator ID, which are the values that were in the Key Information of the Population Selection Definition Rules Form (GLRSLCT).

After extracting the population, you can use the Population Selection Extract Data Form (GLAEXTR) to view and/or modify the people in the population. You can add or delete people from the population using this form. The keys to the form are **Application**, **Selection ID**, and **Creator ID**. (**User ID** is also displayed in the Key Information.) You will be able to add or delete people only from populations that you selected.

After extracting the population, and modifying the people in it if necessary, you can use the population for a variety of purposes. Letters can be produced using Letter Generation, based upon a population, and many Banner reports and processes also can accept a population for processing.

For additional details on population selection, refer to the *Banner General User Guide*.

## Admissions Count by College/Major Report (SARACTM)

**Description** This report is used to produce admission application counts with totals by major and college.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Entry Term	Yes	Enter the term code for which you wish to run the admissions application counts.	Term Code Validation Form (STVTERM)
	Prior Entry Term 1	Yes	Enter the first term for which you want to compare the admissions counts.	Term Code Validation Form (STVTERM)
	Prior Entry Term 2	Yes	Enter the second term for which you want to compare the admissions counts.	Term Code Validation Form (STVTERM)

## Admit Decision Calculation Report (SARBDSN)

**Description** This report is used to calculate automated decisions based on institution rules. The process selects all application records that match the parameter values. If any of the applications have outstanding checklist items, regardless of their application status, they will not be processed and will have a message associated with them on the report. If all checklist items are received, then the process compares each applicant and/or application against the rules on SAADCSN.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Applicant Entry Term	Yes	Enter the term code for which you wish to calculate automatic decisions.	Term Code Validation Form (STVTERM)
	Admissions Type	No	Enter the admissions type code for which you wish to calculate automatic decisions. Multiple values can be entered.	Admission Type Code Validation Form (STVADMT)
	Student Type	No	Enter the student type code for which you wish to calculate automatic decisions. Multiple values can be entered.	Student Type Code Validation Form (STVSTYP)
	Major Code One	No	Enter the major code for which you wish to calculate automatic decisions. Multiple values can be entered.	Major, Minor, Concentration Code Validation Form (STVMAJR)
	Degree Code One	No	Enter the degree code for which you wish to calculate automatic decisions. Multiple values can be entered.	Degree Code Validation Form (STVDEGC)
	College Code One	No	Enter the college code for which you wish to calculate automatic decisions. Multiple values can be entered.	College Code Validation Form (STVCOLL)
	Level Code	No	Enter the level code for which you wish to calculate automatic decisions. Multiple values can be entered.	Level Code Validation Form (STVLEVL)
	Residence Code	No	Enter the residency type code for which you wish to calculate automatic decisions. Multiple values can be entered.	Residence Code Validation Form (STVRESL)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Application Status Code	No	Enter the application status code for which you wish to calculate automatic decisions. Multiple values can be entered.	Admission Application Status Code Validation Form (STVAPST)
	Application Decision Code	No	Enter the application decision code for which you wish to calculate automatic decisions. Multiple values can be entered.	Admission Application Decision Code Validation Form (STVAPDC)
	Apply Updates (Y = Yes, N= No)	Yes	Enter <i>Y</i> to update the admission decisions; enter <i>N</i> to run the report in Audit Mode.	Y Update N Audit
	Program Code	No	Enter the program code for which you wish to calculate automatic decisions.	
	Campus Code	No	Enter the campus code for which you wish to calculate automatic decisions.	Campus Code Validation Form (STVCAMP)
	Citizenship Code	No	Enter the citizenship code for which you wish to calculate automatic decisions.	Citizen Type Code Validation Form (STVCITZ)
	Exclude Decision Code	No	Enter the admissions application decision code for students you wish to exclude from processing.	Admission Application Decision Code Validation Form (STVAPDC)

## Admission Decision Criteria Report (SARDCSN)

**Description** This report is used to list the automated decision rules set up by the institution on the Admissions Decision Rules Form (SAADCSN).

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term (% for all)	Yes	Enter the term code representing the term for which you want the automated decision rules listed; enter % to select all terms in the database.	Term Code Validation Form (STVTERM)
	New Term or Decision Roll	No	Enter the new term for which you want to create automated decision criteria.	Term Code Validation Form (STVTERM)
	Delete Old Term After Roll (Y)	No	Enter <i>Y</i> to delete the old term after the automated decision rules are rolled to the new term. The default is <i>N</i> .	Y Delete old term after roll N Do not delete old term

## Admissions High School Report (SORHSRP)

**Description** This report is used to print the information received from the high schools.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Student Registration Term	Yes	Enter the term code representing the term during which you are printing the high school information (for example, the effective term of the general student record and the registration term for selection).	Term Code Validation Form (STVTERM)
	Admissions Entry Term	Yes	Enter the term code representing the term for which you wish to print the high school information.	Term Code Validation Form (STVTERM)
	Select if Student has Registr.	No	Enter <i>Y</i> to select the high school if the student has registration for the term entered in the Student Registration Term parameter. Leave blank to select students from all terms.	Y Select high school N Do not select high school
	Select if Student has Appl.	No	Enter <i>Y</i> to select the high school if the student has an application for the term that was entered in the Admissions Entry Term parameter. Leave blank to select students from all admissions terms.	Y Select high school N Do not select high school
	High School SBGI Code	No	Enter the source/background institution code for the high school, to report for a single high school.	Source/Background Institution Code Validation Form (STVSBGI)
	State Code of High School	No	Enter the state code for the high school, to report a high school in a specific state.	State/Province Code Validation Form (STVSTAT)

## Admission Purge (SAPADMS)

**Description** This process purges all admissions records for the specified term. It may be run in Audit or Update Mode.

Parameters	Name	Required?	Description	Values
	Purge Term	Yes	Enter the term code representing the term for which you wish to purge the admissions data. The term entered represents the terms up to and including the term for which you would like to purge admissions data.	Term Code Validation Form (STVTERM)
	Bypass Students with History	No	Enter <i>Y</i> if you wish to bypass students with registration and/or academic history, regardless of purge criteria.	
	Activity Date	No	Enter the date after which you wish to purge all admissions activity. Use the date format DD-MON-YYYY. Any admissions activity beyond this date will not be deleted, regardless of other purge criteria.	
	Purge High School Data	No	Enter <i>Y</i> if you wish to purge all high school data.	
	Purge Prior College Data	No	Enter <i>Y</i> if you wish to purge all prior college data.	
	Purge Test Score Data	No	Enter <i>Y</i> if you wish to purge all test score data.	
	Run Mode	Yes	Enter <i>A</i> to produce a listing of all selected purge data without affecting the database. Enter <i>U</i> to update the database after purging the selected data.	A Audit U Update

# SAT Recentering Process (SOPSATS)

**Description** This process takes the original SAT scores loaded into Banner from the Electronic Prospect Load (SRTLOAD) and recalculates or recenters them for compliance with the 1995 SAT requirements from the College Board.

**Note**

Test scores dated prior to April 1, 1995 may be used for recentering. Test scores dated after April 1, 1995 are automatically centered when the test is scored. ■

Parameters	Name	Required?	Description	Values	
	Run Mode	Yes	Enter <i>A</i> to produce a listing of students and their original and recentered SAT scores, without affecting the database. Enter <i>U</i> to update the database records with the recentered test score data.	<i>A</i> <i>U</i> Update	Audit

## AMCAS Extract File (SARAMXF)

**Description** This process is used to create a flat file of data to be electronically submitted to AMCAS.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Application Term Code	Yes	Enter the term code for the current application year.	Term Code Validation Form (STVTERM)
	Level Code	Yes	Enter the level code for AMCAS processing.	Level Code Validation Form (STVLEVL)
	Audit/Update Indicator	Yes	Enter <i>A</i> for an audit report or <i>U</i> to update the database.	A Audit report U Update the database
	Matriculation Date	No	Enter the date in MMY Y format.	
	Expected Graduation Date	Yes	Enter the expected graduation date in MMY Y format.	
	School Code - for multiples	No	Enter the school code value for the extract process. This value will only be used if the <i>AMCASSCHCODE</i> rule on SAAERUL for group ADMS is not entered.	
	State Code - for multiples	No	Enter the state code value for the extract process. This value will only be used if the <i>AMCASSCHSTAT</i> rule on SAAERUL for group ADMS is not entered.	
	Default AMCAS Campus Code	Yes	Enter the campus code to be inserted into the Admissions Action flat file if no campus code exists in the application.	
	User ID	Yes	Enter the user ID of the person responsible for AMCAS Admissions Action files. This user ID will be inserted into each flat file record.

## Communication Load Process (SURLOAD)

**Description** This process is used to perform a mass entry of mail records.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	File	Yes	Enter the path and file name for the flat file of PIDMS. For example, /temp/pidms.dat.	
	System Indicator	Yes	Enter the system indicator to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	System Indicator Validation Form (GTVSYSI)
	Term Code	Yes	Enter the term code to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	Term Code Validation Form (STVTERM)
	Letter Code	No	Enter the letter code to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	Letter Code Validation Form (GTVLETR)
	Module Code	No	Enter the module code to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	
	Material Code	No	Enter the material code to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	Material Code Validation Form (STVMATL)
	Date Printed	No	Enter the date printed in in DD-MON-YYYY format.	
	Initials	No	Enter the initial code to be displayed on the Student Mail Form (SUAMAIL) or to be used to populate the GURMAIL table.	Initials Code Validation Form (STVINIT)
	Wait Days	No	Enter the number of days between initiating and printing the letter.	

Parameters	Name	Required?	Description	Values
	Quantity	No	Enter the quantity of materials to be sent.	
	Generated or Published	Yes	Enter <i>G</i> for generated materials or <i>P</i> for published materials. <i>G</i> is the default.	G Generated P Published

## Prior College Summary Report (SORPCSM)

**Description** This report is used to collect source/background institution prior college summary information similar to what is found on the Prior College Enrollment Summary Form (SOAPCSM).

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	College (SBGI) Code	No	Enter the prior college source/background institution code for which reporting counts are desired.	Source/Background Institution Code Validation Form (STVSBGI)
	Term Code	No	Enter the term code for the application and recruiting records you wish to include in the report.	Term Code Validation Form (STVTERM)
	Level Code	No	Enter the level code for the application and recruiting records you wish to include in the report.	Level Code Validation Form (STVLEVL)
	Campus Code	No	Enter the campus code for the application and recruiting records you wish to include in the report.	Campus Code Validation Form (STVCAMP)
	College Code	No	Enter the college code for the application and recruiting records you wish to include in the report.	College Code Validation Form (STVCOLL)
	Degree Code	No	Enter the degree code for the application and recruiting records you wish to include in the report.	Degree Code Validation Form (STVDEGC)
	Program Code	No	Enter the program code for the application and recruiting records you wish to include in the report.	Program Definition Rules Form (SMAPRLE)
	Major Code	No	Enter the major code for the application and recruiting records you wish to include in the report.	Major, Minor, Concentration Code Validation Form (STVMAJR)
	Student Type Code	No	Enter the student type code for the application and recruiting records you wish to include in the report.	Student Type Code Validation Form (STVSTYP)
	Subtotal by Campus	No	Enter <i>Y</i> to sort by term/level/campus or <i>N</i> to sort by term and level only.	Y Term/level/campus N Term/level

## Rating Audit Report (SARDCBT)

**Description** This process is used to view applications that have been updated on the Admissions Decision and Rating Batch Entry Form (SAADCBT) for a specific date or dates.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term Code	No	Enter the term of the applications that have been given ratings or decisions that you would like to review.	Term Code Validation Form (STVTERM)
	Decision Date From	No	Enter the decision date (beginning of range) from which you wish to see records with updated decision codes.	
	Decision Date To	No	Enter the decision date (end of range) by which you wish to see records with updated decision codes.	
	Decision Code	No	Enter the decision code for applications which have been updated on the Admissions Decision and Rating Batch Entry Form (SAADCBT).	Admission Application Decision Code Validation Form (STVAPDC)
	Level Code	No	Enter the level code for applications which have been updated on Admissions Decision and Rating Batch Entry Form (SAADCBT).	Level Code Validation Form (STVLEVL)
	Campus Code	No	Enter the campus code for applications which have been updated on Admissions Decision and Rating Batch Entry Form (SAADCBT).	Campus Code Validation Form (STVCAMP)
	Degree Code	No	Enter the degree code for applications which have been updated on Admissions Decision and Rating Batch Entry Form (SAADCBT).	Degree Code Validation Form (STVDEGC)

Parameters	Name	Required?	Description	Values
	Program Code	No	Enter the program code for applications which have been updated on Admissions Decision and Rating Batch Entry Form (SAADCBT).	Program Definition Rules Form (SMAPRLE)
	Major Code	No	Enter the major code for applications which have been updated on Admissions Decision and Rating Batch Entry Form (SAADCBT).	Major, Minor, Concentration Code Form (STVMAJR)

## Administrator Assignments Process (SORAINF)

**Description** This process allows institutions to use the rules defined on the Administrator Role Rules Form (SOAADAS) to assign administrators to recruit and applicant records. The process populates the SORAINF table. This process also runs when the **Assign** button is selected on the Assigned Administrators window on the Recruit Prospect Information Form (SRARECR), the Quick Recruit Form (SRAQUIK), the Quick Entry Form (SAAQUIK), and the Admissions Application Form (SAAADMS).

Parameters	Name	Required?	Description	Values
	Term Code	Yes	Enter the term code of the assignment.	Term Code Validation Form (STVTERM)
	Module	Yes	Enter the module for the assignment and selection, values are <i>A</i> (Admissions) or <i>R</i> (Recruiting).	A Admissions R Recruiting
	Update/Report Indicator	Yes	Enter <i>U</i> to update the database, <i>R</i> to update and produce a report, or <i>A</i> to produce an audit report. <b>Note:</b> <i>U</i> only updates the database. It does not produce a report.	U Update R Report and update A Audit
	Delete Existing Assignments	Yes	Enter <i>Y</i> to indicate that all existing assignments are to be deleted or <i>N</i> to not delete existing assignments.	Y Delete assignments N Do not delete assignments
	Print Indicator	No	Enter <i>ALL</i> to print all assignments or <i>TERM</i> to print an assignment for a term and module.	ALL Print all assignments TERM Print all assignments for term and module

Parameters	Name	Required?	Description	Values
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Inquiry Form (GLISLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Creator ID	No	Enter the user ID of the person creating the sub-population rules. The creator ID must have been specified when defining the selection identifier. All or none of the population selection parameters must be entered.	
	User ID	No	Enter the user ID for the population selection. This will match the Creator ID and is the Banner logon user ID. All or none of the population selection parameters must be entered.

## Electronic App Purge Process (SARETPG)

**Description** This process is used to purge data from the electronic application holding tables by date range, application type, source, term, and process indicator.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Application Source	No	Enter the application source code for the electronic applications, or leave blank for all.	EDI Application Source Code Validation Form (STVAPLS)
	Application Type	No	Enter the application type code for the electronic applications, or leave blank for all.	Application Type Code Validation Form (STVWAPP)
	Term Code	No	Enter the term code for the electronic applications, or leave blank for all.	Term Code Validation Form (STVTERM)
	Start Date	No	Enter the start date for when the applications were created in format DD-MON-YYYY.	
	End Date	No	Enter the end date for when the applications were created in format DD-MON-YYYY.	
	Process Indicator	No	To indicate which applications to select, enter <i>P</i> for Processed, <i>E</i> for Errors, <i>V</i> for Verified, or <i>N</i> for Not Processed, or leave blank for all. The default is blank/all.	P Processed E Errors V Verified N Not Processed % All

Parameters	Name	Required?	Description	Values
	Print Detail or Print Summary	Yes	Enter <i>D</i> to Print Detail or <i>S</i> to Print Summary. The default is <i>D</i> .  If <i>D</i> is entered, the applicant's ID, name, source, application type, term, curriculum, date created, date loaded into production, and Banner ID will be printed.  If <i>S</i> is entered, summary information will be printed.	D Detail S Summary
	Audit or Update	Yes	Enter <i>A</i> to produce an audit report or <i>U</i> to update the database.	A Audit U Update

## Elec App Verify/Load Process (SARETMT)

**Description** This process matches, verifies, and loads electronic applications to Banner production tables based on the matching rules specified by the matching source code assigned to the interface code on STVINFC. The process performs the test score equivalency lookup and then stores the equivalent test scores if applicable.

This process has three report sections. The first two sections are optional and collect and print the following: successfully verified and/or loaded applications, applications with verification or load errors, and detail or summary information. The third section is the control page.

### Processing Notes

The Interface Code w/Match Rules parameter provides the values for the matching algorithm, which determines if the record status is either New, Matched, Suspense, or Error. The matching needs to be done only for new applicants. If the person is not matched to a Banner record, a new SPRIDEN row will be created for the person with either a generated ID or the SSN, the SABSTUD row will be created with a new pidm value, and the **Person Status (Indicator)** will be updated to *Y*. If the person matches a Banner record, the SABSTUD row will be created with the Banner pidm value, and the **Person Status (Indicator)** will be updated to *Y*. If the person falls into the suspense group, the **Person Status (Indicator)** will be updated to *S*. Applications must have a *Y* in the **Person Status (Indicator)** before they can be pushed into Banner production.

The Previously Applied and Previously Attended elements appear in the Name section of the Web data entry pages. Assuming these elements are added to the Name section using SAAWAPP, if the student is in suspense status, and they state that they have never attended or submitted an application, the person status will be changed from Suspense to New.

If the electronic applicant read in the main select has already been through the match phase and they have a SPRIDEN record, the match step will be bypassed. This may happen in the case of applicants who are initially put into the match-suspense state. The user needs to resolve the suspense issue using SAAEAPS. They have the option of completing the verification process online after resolving the match issues and accepting the person status or re-running SARETMT.

The electronic applicant may also have a SPRIDEN record if they have been identified as an existing student at the onset of the web application process. The Web application packages already insert the PIDM in the electronic application holding tables. In this case the matching steps will also be bypassed.

If the Override App. Status Ind. parameter is set to *N*, then this step must be done manually on SAAEAPS, if there are any application status rules defined on STVASTA. If there are no application status rules, the applicant's application status will automatically be set to *Y*.

If the Override App. Status Ind. parameter is set to *Y*, the applicant's **Application Status (Indicator)** will automatically be set to *Y*. The **Application Status (Indicator)** must be *Y* before the application is pushed into Banner production.

Once the electronic application has been matched or determined to be new, the verification package is executed. This is the same processing as that which occurs in SAAEAPS. The verification rules follow the procedures and routines entered on SAAECRL for a given application type. Once the verification process has been completed successfully, the **Process (Indicator)** on SAAEAPS is set to *V* for Verified. Applications must have a *V* in the **Process (Indicator)** field before they can be pushed into Banner production.

The last task is to load the application into Banner. To achieve this, the application must be completed, have an accepted status, the manual person and application verification **Completion Indicators** must both be *Y*, and the **Process (Indicator)** must be *V*. Once the application is loaded, the **Process (Indicator)** which displays on SAAEAPS will be updated to the value *P* for application pushed.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Interface Code w/Match Rules	Yes	Enter the interface code associated with the matching rules on GORCMRL to be used in matching the application to Banner.	Interface Validation Form (STVINFC)
	Application Source	No	Enter the application source code for the electronic applications, or enter % for all.	EDI Application Source Code Validation Form (STVAPLS)
	Application Type	No	Enter the application type code for the electronic applications, or enter % for all.	Application Type Code Validation Form (STVWAPP)
	Start Date Range	No	Enter the start date for when the applications were created in format DD-MON-YYYY.	
	End Date Range	No	Enter the end date for when the applications were created in format DD-MON-YYYY.	
	Term Code	No	Enter the term code for the electronic applications, or enter % for all.	Term Code Validation Form (STVTERM)

<i>Parameters</i>	<i>Name</i>	<i>Required?</i>	<i>Description</i>	<i>Values</i>
	Override App. Status Ind.	Yes	Enter <i>Y</i> to override the application status indicator or <i>N</i> to not override the indicator. The default is <i>Y</i> .	<i>Y</i> Override status <i>N</i> Do not override
	Override App. Accept Ind.	Yes	Enter <i>Y</i> to override the application accept indicator or <i>N</i> to not override the indicator. The default is <i>Y</i> .	<i>Y</i> Override accept <i>N</i> Do not override
	Use Generated ID, SSN, or Web ID	Yes	Enter <i>G</i> to use the Generated ID, <i>S</i> to use the SSN, or <i>E</i> to use the Web ID for the application being matched, verified, and pushed. The default is <i>G</i> .	<i>G</i> Generated ID <i>S</i> SSN <i>E</i> Web ID
	Print Detail/Summary or Errors	Yes	Enter <i>D</i> for Print Detail, <i>E</i> for Errors, <i>B</i> for Both, or <i>S</i> for Summary. The default is <i>D</i> .  If <i>D</i> is entered, the electronic application ID, Banner ID, name, application source and type, term, match status, and curriculum will be printed.  If <i>E</i> is entered, the electronic application ID, Banner ID, name, application source and type, term, match status, and the process indicator error message will be printed.  If <i>S</i> is entered, summary information will be printed.	<i>D</i> Detail <i>E</i> Errors <i>B</i> Both <i>S</i> Summary
	Audit or Update	Yes	Enter <i>A</i> to produce an audit report or <i>U</i> to update the database.	<i>A</i> Audit <i>U</i> Update

Parameters	Name	Required?	Description	Values
	Create Recruit Records Y or N	Yes	Enter <i>Y</i> to call the sakmods.p_create_recruit package after the application is pushed to create a corresponding recruit record for the applicant. Enter <i>N</i> to not create a corresponding recruit record. The default is <i>N</i> .	Y Create recruit record N Do not create recruit record
	Source Code for Recruit Record	No	Enter the SBGI source code to be inserted in the newly created recruit record. Valid values come from STVSBGI, and the SBGI source code selected will be inserted in the recruit record. The value entered into this field will be inserted in the SRRSRC_SBGI_CODE field for the recruit record.	Source/Background Institution Code Validation Form (STVSBGI)

## TS 189 Upload to Banner (SAR189U)

**Description** This process is used to receive an electronic (EDI) admissions application in SPEEDE (Standardization of Post-Secondary Education Electronic Data Exchange) format and to automate the entry of the admissions application data into the Banner Admissions module. Please refer to the “Admissions Procedures” section of this chapter for more information on TS 189 processing.

Parameters	Name	Required?	Description	Values
	Input File	Yes	Enter the input directory path and file name.	
	Test Flag	No	Enter <i>Y</i> to run and print the debug messages. Enter <i>N</i> to not run or print the debug messages.	Y Run debugging N Do not run debugging
	Application Type	No	Enter the application type code for the EDI applications.  If the application type is entered here, the value read from the SAAERUL rule will not be used. (group of <i>ADMS</i> , label of <i>EDIWAPPCODE</i> )	Application Type Code Validation Form (STVWAPP)
	Term Code	No	Enter the term code for the EDI applications.	Term Code Validation Form (STVTERM)

```

## Student Email Process (SOREMAL)

**Description** This process is used for sending a mass mailing as an email letter using population selection on IDs for individuals with existing Banner records.

The process reads the population selected and requires the people have a *SPRIDEN* row and an email address defined on *GOAEMAL*. This process also requires the person have an email letter code on *GURMAIL* with a blank print date. If the letter does not exist for the person in *GURMAIL* or has already been printed, an error message will print on the report, and no email will be sent. If the letter does exist on *GURMAIL*, the process updates the date printed and the origin code to *E* on the appropriate *GURMAIL* record for each person.

This process reports the outcome of all records selected. This includes all persons in the population selection who do not have an email address. No email can be sent to these individuals, and a paper letter will need to be sent separately. The report also includes the people who do not have the letter recorded on *GURMAIL* or for whom the letter exists but has already been printed. This process does not report the emails returned because of invalid email addresses. That information will be returned to the in box of the “From” email address.

The From Email Address will default to “jobsub” if the process is run from job submission and the From Email Address parameter is left blank or the operating system is *VMS*, or will default to the userid of the person running the process from the operating system prompt. Use the *FROM* Email Address parameter to indicate a from address other than “jobsub” or an Oracle ID.

This process requires that email can be sent from the server where the process is run. It is suggested for mass email mailings that the same letter be constructed using traditional letter generation procedures. The letter generation process should run directly after the email letter processing to pick up all people in the population selection who have a null print date (for example, they didn’t have an email address).

This process requires that the letter be defined on *SOAELTR* and have a module type of *A* for Admissions, *R* for Recruiting, or *S* for General Student. The module type is defined for the letter on *SOAELTL*.

This process has the option of being run in Audit Mode. If the process is submitted with the Print to Log parameter set to *A*, the email messages will be printed to the log file and not sent, and the print date will not be updated on the *GURMAIL* row.

If the initials column is filled in on the *GURMAIL* row for the student, the name and email address for the initials will be printed at the end of the email letter. The name and email are expanded from the *STVINIT* table.

The email letter itself is written to a disk file in ASCII format. The available formatting on SOAELTR includes a new line and new paragraph. If a row in the SOAELTR has a new line format, and a data column which expands to blanks and no text, the blank line will not be printed. The horizontal rule format option is not available for the ASCII email letter. This is available for the Web Admissions Signature Page.

#### Note

This process uses the *sendmail* command on UNIX and VMS platforms. ■

The following errors may be encountered when using the `sokemal.p_sendmail` package with the SOKEMAL procedure, both of which use the Oracle API `UTL_SMTP`.

- *ORA-20001: 421 Service not available*

This indicates that the mailhost entered is not correct. Please check with the system administrator for assistance in obtaining the correct mailhost name.

- *ORA-20002: 550 5.1.1 jdoe@xxx.com... User unknown*

This indicates that the email address being sent is invalid. The email processes (SAREMAL, SOREMAL, and SRREMAL) will not stop running. The error will print in the detail on the report output.

- *ORA-29540: class oracle/plsql/net/TCPConnection does not exist*

This indicates that the correct java classes are not installed. Please refer to Chapter 65 of the *Oracle8i Supplied PL/SQL Packages Reference Release 2 (8.1.6) (Part# A76936-01)* for more information.

Parameters	Name	Required?	Description	Values
	Email Letter Code	Yes	Enter the email letter code defined for the recruit/applicant/student population email letter.	HTML Letter Rules Form (SOAELTL)
	Student ID	No	Enter the student's ID when you are running the process for a single ID.	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Inquiry Form (GLISLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Creator ID	No	Enter the user ID of the person creating the sub-population rules. The creator ID must have been specified when defining the selection identifier. All or none of the population selection parameters must be entered.	
	User ID	No	Enter the user ID for the population selection. This will match the creator ID and is the Banner logon user ID. All or none of the population selection parameters must be entered.	
	Term Code	No	Enter the term code for the student records to be included in the letter processing.	Term Code Validation Form (STVTERM)
	Audit/Update Mode	Yes	Enter <i>A</i> to print the email letter to a log file and not send it. Enter <i>U</i> to send the email letter to the student and update GURMAIL. The default is <i>U</i> .	A Print to log U Send email
	Email Subject Text	No	Enter the subject text for the email. If left blank, the subject of the email will also be blank.	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	FROM Email Address	Yes	<p>Enter the from email address for the email letter with the user ID and host (i.e., jdoe@college.edu). The default address is the one for the ID that is running the process.</p> <p><b>Note:</b> The email address is not validated by the TCP connection. You can enter an invalid email address, and the email will still be sent.</p> <p>This parameter is required for use with the Oracle Mail API.</p>	
	Email Sender's Name	No	<p>Enter text to show the name of the sender as well as the email address in order to personalize the email. For example, enter "John Doe"&lt;jdoe@college.edu&gt; as the sender instead of jdoe@college.edu. This parameter is used with the FROM Email Address parameter.</p>	
	Mail Host	Yes	<p>Enter the mail host from which the email will be sent (i.e., mailhost.xxx.edu). This information is available from the system administrator and is the name of the mail TCP Connection.</p>

## Batch Email for Elec. Apps. Process (SAREMAL)

**Description** This process is used for sending out a mass mailing as an email letter to individuals who have started or completed a Web application.

This process selects the processing population from the Electronic Applicant View (SAVEAPS). For each electronic applicant processed, an email will be created based on the email letter defined on SOAELTR. This process requires that the letter defined on SOAELTR have a module type of *E*. The module type is defined for the letter on SOAELTL.

This process lists all electronic applicants selected. If the electronic applicant does not have an email address, a missing email address error message is printed. No email can be sent to these individuals, and a paper letter will need to be sent. This process does not report the emails returned due to invalid email addresses. That information will be returned to the in-box of the “From” email address which is the ID that processes the job through Banner job submission.

The From Email Address will default to “jobsub” if the process is run from job submission and the From Email Address parameter is left blank or the operating system is VMS, or will default to the userid of the person running the process from the operating system prompt. Use the FROM Email Address parameter to indicate a from address other than “jobsub” or an Oracle ID.

This process requires that email can be sent from the server where the process is run. This process has the option of testing the email process. If the process is submitted with the Print to Log parameter set to *L*, the email messages will be printed to the log file and not sent.

The email letter itself is written to a disk file in ASCII format. The available formatting on SOAELTR includes a new line and new paragraph. If a row in SOAELTR has a new line format, and a data column which expands to blanks, and no text, the blank line will not be printed. The horizontal rule format option is not available for the ASCII email letter. This is available for the Web Admissions Signature Page.

### Note

This process uses the *sendmail* command on UNIX and VMS platforms. ■

The following errors may be encountered when using the `sokemal.p_sendmail` package with the SOKEMAL procedure, both of which use the Oracle API `UTL_SMTP`.

- *ORA-20001: 421 Service not available*

This indicates that the mailhost entered is not correct. Please check with the system administrator for assistance in obtaining the correct mailhost name.

- *ORA-20002: 550 5.1.1 jdoe@xxx.com... User unknown*

This indicates that the email address being sent is invalid. The email processes (SAREMAL, SOREMAL, and SRREMAL) will not stop running. The error will print in the detail on the report output.

- *ORA-29540: class oracle/plsql/net/TCPConnection does not exist*

This indicates that the correct java classes are not installed. Please refer to Chapter 65 of the *Oracle8i Supplied PL/SQL Packages Reference Release 2 (8.1.6) (Part# A76936-01)* for more information.

Parameters	Name	Required?	Description	Values
	Email Letter Code	Yes	Enter the email letter code defined for the electronic applicant email letter.	HTML Letter Rules Form (SOAELTL)
	Electronic Applicant ID	No	Enter the ID of the electronic applicant when you are running the process for a single ID.	
	Term Code	No	Enter the term code for the electronic applicant records to be included in the email processing.	Term Code Validation Form (STVTERM)
	App Create Start Date Range	Yes	Enter the start date when the applications were created in MON-DD-YYYY format.	
	App Create End Date Range	Yes	Enter the end date when applications were created in MON-DD-YYYY format.	
	Process Indicator	No	To indicate which applications to select, enter <i>P</i> for Processed, <i>E</i> for Errors, <i>V</i> for Verified, or <i>N</i> for Not Processed, or leave blank for all. The default is blank/all.	P Processed E Errors V Verified N Not Processed % All

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Application Type	No	Enter the application type code for the electronic applications, or leave blank for all.	Application Type Code Validation Form (STVWAPP)
	Application Source	No	Enter the application source code for the electronic applications, or leave blank for all.	EDI Application Source Code Validation Form (STVAPLS)
	Print Email to Log (L); Send (S)	Yes	Enter <i>L</i> to print the email to a log file and not send it. Enter <i>S</i> to send the email to the student. The default is <i>S</i> .	L Print to log S Send email
	Email Subject Text	No	Enter the subject text for the email.	
	FROM Email Address	Yes	<p>Enter the from email address for the email letter with the user ID and host (i.e., jdoe@college.edu). The default address is the one for the ID that is running the process.</p> <p><b>Note:</b> The email address is not validated by the TCP connection. You can enter an invalid email address, and the email will still be sent.</p> <p>This parameter is required for use with the Oracle Mail API.</p>	
	Email Sender's Name	No	Enter text to show the name of the sender as well as the email address in order to personalize the email. For example, enter "John Doe"<jdoe@college.edu> as the sender instead of jdoe@college.edu. This parameter is used with the FROM Email Address parameter.	
	Mail Host	Yes	Enter the mail host from which the email will be sent (i.e., mailhost.xxx.edu). This information is available from the system administrator and is the name of the mail TCP Connection.

## Admission Rating Calculation Report (SARRATE)

**Description** This process/report is used to calculate the admissions rating for an ID or population. This report uses the rules that have been defined by the institution on the Admissions Rating Formula Definition Form (SAARRDF). Either a population selection, an ID, or multiple IDs must be entered. When the Recalculate Existing Rating parameter is set to *Y*, all existing ratings are updated if the new rating calculated by SARRATE is higher than the existing rating.

Institutions who choose to use the Administrator Rating Type Rules block of the Administrator Rating Type Rules Form (SAARRCT) must run SARRATE with the Recalculate Existing Rating parameter set to *Y* at some point in the processing cycle. Otherwise the default rating records that have a rating set to zero will never be updated.

Parameters	Name	Required?	Description	Values
	Term	Yes	Enter the term code which matches the formula defined on SAARRDF that should be used by SARRATE.	Term Code Validation Form (STVTERM)
	Recalculate Existing Ratings	Yes	Enter <i>Y</i> to recalculate existing ratings or <i>N</i> to not recalculate existing ratings. The default is <i>N</i> .	Y Recalculate existing ratings N Do not recalculate existing ratings
	Applicant ID	No	Enter the ID (or IDs) of the applicant(s) whose rating is to be calculated	
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	Administrator ID	Yes	Enter the ID of the administrator who is to be associated with the calculated rating.	
	Rating Type	Yes	Enter the rating type code which matches the rating type of the formula defined on SAARRDF that is to be calculated.	Admissions Rating Type Validation Form (STVRATP)
	Role for Administrator ID	Yes	Enter the role code to be stored with the Administrator ID for the calculated rating.	Administrative Role Code Validation Form (STVRADM)
	Application Status	Yes	Enter the application status code that indicates which population of applications should be considered for a rating.	Admission Application Status Code Validation Form (STVAPST)
	App Status Begin Date	Yes	Enter the beginning date for the application status in MON-DD_YYYY format.	
	App Status End Date	Yes	Enter the ending date for the application status in MON-DD_YYYY format.	
	Valid Test Source for Formula	Yes	<p>Enter the test source code to be used in determining if a test score equivalency exists on SOATEQU. The default is <i>TAPE</i>. When running, the SARRATE process will use test scores with any of the tape sources identified in this parameter.</p> <p>Multiple values may be entered. Using multiple values allows the process to select the highest test score (having a defined source code) associated with a factor code defined in a formula.</p>	Admission Test Score Source Code Validation Form (STVTSRC)

Parameters	Name	Required?	Description	Values
	Run Mode	Yes	Enter <i>A</i> for Audit Mode to print a report without updating the database. Enter <i>U</i> for Update mode to update the database.	A Audit U Update
	Report Type	Yes	Enter <i>S</i> to produce a control report that lists the number of records processed and a summary of the entered parameters. Enter <i>D</i> to produce a detailed report.	S Summary of records and parameters D Detail of fields on report

## Electronic Application Report (SARETBL)

**Description** This report is used to view information about a student's electronic admissions application. The report is a companion to the Electronic Application Submitted Form (SAAETBL). There is no control page for this report.

This is an Oracle report. It is run through job submission on GJAPCTL.

Parameters	Name	Required?	Description	Values
	Application Source	No	Enter the source of the admissions application such as EDI or WEB.  <b>Note:</b> While this parameter is not required, either the Application Source, Add Date, or Web ID parameter must be entered for the report to produce output.	EDI Application Source Code Validation Form (STVAPLS)
	Add Date	No	Enter the date in DD-MON-YYYY format that the application was completed.  <b>Note:</b> While this parameter is not required, either the Application Source, Add Date, or Web ID parameter must be entered for the report to produce output.	
	Web ID	No	Enter the Web ID of the student for which you wish to see electronic application information.  <b>Note:</b> While this parameter is not required, either the Application Source, Add Date, or Web ID parameter must be entered for the report to produce output.	

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>	
	Destination Format	Yes	Use the list of values to select the format of the report output.  The default format is <i>PDF</i> .	DELIMITED DELIMITED DATA HTML HTMLCSS POSTSCRIPT (This format is not currently supported.) PRINTER DESTINATION (This format is not currently supported.) RTF XML	
	Destination Type	Yes	Use the list of values to select <i>CACHE</i> , <i>FILE</i> , <i>MAIL</i> , or <i>PRINTER</i> , to indicate where the report output should be directed.  You may use <i>CACHE</i> to display the output, and then you can print the report.  The default is <i>CACHE</i> .	CACHE FILE MAIL PRINTER	Display report on screen Save report to a file Send report via email Print report
	Destination Name	No	Enter the name of the destination where the output type selected above should be directed. The destination name can be 30 characters in length.		

Parameters	Name	Required?	Description	Values
			<p>For example:</p> <p><i>FILE</i> - Enter a valid drive-folder-filename (<i>f:\share\myfile.pdf</i>).</p> <p><b>Note:</b> Due to the potentially sensitive nature of report output information, you should send output to a file where only the user has read access.</p> <p><i>MAIL</i> - Enter a valid email address (<i>jdoe@aol.com</i>). Enter multiple addresses with commas as separators.</p> <p><i>PRINTER</i> - Enter a valid printer name. If you selected <i>PRINTER</i> in the Destination Type parameter, and the value is left blank in the Destination Name parameter, the default report server printer will be used.</p>	
	Execution Mode	Yes	<p>Enter the execution mode for the report as <i>RUNTIME</i> (from the form) or <i>BATCH</i> (from job submission).</p> <p>The default is <i>RUNTIME</i>.</p>	<p><i>RUNTIME</i>    Run from the form</p> <p><i>BATCH</i>        Run from job submission</p>
	Communication Mode	Yes	<p>Enter the communication mode for synchronous (<i>SYNC</i>) or asynchronous (<i>ASYNC</i>).</p> <p>Synchronous specifies that control is returned to the calling form <i>after</i> the report has completed its processing.</p> <p>Asynchronous specifies that control is returned to the calling form immediately, even if the report has <i>not</i> completed its processing.</p> <p>The default is <i>SYNC</i>.</p>	<p><i>SYNC</i>        Wait on Banner form for report results</p> <p><i>ASYNC</i>        Run report behind the scenes</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>	
	Parameter Form	Yes	Enter <i>YES</i> to display the Oracle Report Parameters Form or <i>NO</i> to not display the Oracle Report Parameters Form.  The default is <i>NO</i> .	NO	Do not display Report Parameters Form
				YES	Display Report Parameters Form
	Show Report Value Window	Yes	Enter <i>YES</i> to display the Report Value Window or <i>NO</i> to not display the Report Value Window.  <b>Note:</b> This parameter has no impact on job submission.  The default is <i>NO</i> .	NO	Do not display Report Value Window
				YES	Display Report Value Window

## Learner Curriculum Conversion Process (SOPLCCV)

**Description** This process is used to read the input population and run the curriculum conversion process. You must enter a valid ID or create a population selection to run this process.

The detailed output indicates the ID and name of each Banner person whose curriculum data has been converted, as well as how many records within each module have been converted. In addition, the report indicates how many Banner IDs have been processed in total. The summary output displays the totals.

<i>Parameters</i>	<i>Name</i>	<i>Required?</i>	<i>Description</i>	<i>Values</i>
	Student Learner Module	No	Enter the student learner module code for the conversion process.	Learner Module Validation Form (STVLMOD)
	Term	No	Enter the term code for which records are to be processed.	Term Code Validation Form (STVTERM)
	Learner ID	No	Enter the ID or IDs for the student(s) to be processed.  Enter an ID number or enter % to select all SPRIDEN IDs where a recruiting, admissions, learner, or outcome record exists.  If you enter a module code in the Student Learner Module parameter, the process will check for records only in that module.	
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	User ID	No	Enter the user ID for the population selection. This is the ID of the user who selected the population of people. This may or may not be the same as the Creator ID. All or none of the population selection parameters must be entered.	
	Rerun Conversion Indicator	Yes	Enter <i>Y</i> to delete and rebuild curriculum records, or enter <i>N</i> to leave the records as they are. The default is <i>N</i> .	Y Delete and rebuild records N Do not delete and rebuild records
	Report Type	No	Enter <i>D</i> to produce a detailed report or <i>S</i> to produce a summary report. The default is <i>S</i> .	D Detail report S Summary report
	Run Mode	Yes	Enter <i>A</i> to run in Audit Mode or <i>U</i> to run in Update Mode and update the database records. The default is <i>A</i> .	A Audit Mode U Update Mode

## Report Sample—Learner Curriculum Conversion Process (SOPLCCV)

## Learner Curriculum Purge Process (SOPLCPG)

**Description** This process is used to purge SORLCUR rows and/or SORLFOS rows for curriculum records from Recruiting, Admissions, General Student (Learner), and Academic History (Outcome). This process calls the `sb_curriculum.p_delete` API which in turn calls the `sb_fieldofstudy.p_delete` API to delete all selected curriculum and fields of study records. This process is run for an ID or a population selection, by term and/or learner module, and can be run in Update or Audit Mode.

Since users may not want to maintain inactive and non-current curriculum records on a student, they can use SOPLCPG to purge inactive and non-current student curricula. This process deletes an SORLCUR row and its associated SORLFOS row(s). Non-current curriculum rows are defined as rows that have a value of *N* in the **Current** field in the Curriculum or Field of Study blocks. The value that populates the field is located in the `SOVLCUR_CURRENT_IND` and `SOVLFOS_CURRENT_IND` view fields.

The SOPLCPG process ensures that if a curriculum record (SORLCUR) is removed, all related field of study rows (SORLFOS) are also removed. This process only purges curriculum rows that are non-current. Field of study rows are only purged in association with their respective curriculum record. Therefore, if a curriculum record is current and has an associated SORLFOS row that is non-current and inactive, the SORLFOS row will not be purged. Also, when a *LEARNER* curriculum record that is targeted to be purged is non-current for the processing term and is current in a different term, it will not be purged.

The process can be used to archive curriculum records to curriculum and field of study history tables (SORHCUR and SORHFOS). This provides historical data for reference, even after the records have been purged from the main curriculum and field of study tables.

The process checks if the curriculum record has an associated graduation application. The curriculum record will not be deleted if the graduation application exists, the module code for the record is *LEARNER*, and the record is not the only curriculum record that is attached to the graduation application.

<i>Parameters</i>	<i>Name</i>	<i>Required?</i>	<i>Description</i>	<i>Values</i>
	Learner Module	No	<p>Enter the student learner module code for the conversion process.</p> <p>The valid values for this parameter are <i>ADMISSIONS</i>, <i>RECRUIT</i>, <i>LEARNER</i>, and <i>OUTCOME</i>. If this parameter is left blank, all curriculum (SORLCUR) and field of study (SORLFOS) records for these modules are examined for the population selection and/or individual IDs (SPRIDEN).</p>	Learner Module Validation Form (STVLMOD)
	Term	No	<p>Enter the term code for which records are to be processed.</p> <p>If this parameter is left blank, the report will use the highest SGBSTDN record for the Learner module to determine which curriculum record is current.</p>	Term Code Validation Form (STVTERM)
	Learner ID	No	Enter the ID or IDs for the student(s) to be processed.	
	Application Code	No	<p>Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.</p> <p>The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.</p>	Application Inquiry Form (GLIAPPL)
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	User ID	No	Enter the user ID for the population selection. This is the ID of the user who selected the population of people. This may or may not be the same as the Creator ID. All or none of the population selection parameters must be entered.	
	Run Mode	Yes	Enter <i>A</i> to run in Audit Mode or <i>U</i> to run in Update Mode and update the database records. The default is <i>A</i> .	A Audit Mode U Update Mode
	Report Type	Yes	Enter <i>D</i> to print a detail report or <i>S</i> to print a summary report. The default is <i>D</i> . The detail report lists each ID and the associated curriculum detail.	D Detail report S Summary report
	Archive History	No	Enter <i>Y</i> to write all purged data to the curriculum and field of study history tables (SORHCUR and SORHFOS) for archiving or <i>N</i> to not archive the data. <i>Y</i> is the default.	Y Archive N Do not archive

## Non-Destructive Curric Update Report (SORLCHG)

**Description** This report is used to show non-destructive updates made to curriculum and/or field of study records. This report is run for an ID, all IDs, or a population selection, by term and/or learner module, by start and end dates, by curriculum status and/or curriculum activity status, and by searches on SORLCUR, SORLFOS or both.

A non-destructive update is used in the curriculum rows to maintain a history of all changes to a learner's curriculum, as no updates are allowed to existing curriculum and field of study records. The process used to update existing curriculum information is to duplicate the existing record, and then update the newly created record with the appropriate changes (i.e., to inactivate the record and indicate why it was inactivated). This report may be used to track changes made in curriculum, attempt to establish trends, and determine curriculum retention. The process selects SORLFOS rows independently of the associated SORLCUR rows.

*Users are allowed to delete curriculum and field of study records. Deleted records are not considered non-destructive and will not be displayed on the report.*

The system will determine if a record has a non-destructive update using the following criteria:

- If a row is non-current, the SOVLCUR\_CURRENT\_IND and/or the SOVLFOS\_CURRENT\_IND fields are set to N.
- or*
- If a row has a curriculum activity status of type *INACTIVE* (the SOBCACT\_ACTIVE\_IND is set to N).

*A row can be inactive and still be current. Conversely, a row can be non-current and still be active.*

The report sort order is based on the following criteria:

- Records are sorted by last name, first name, middle name, and Banner ID (in ascending order).
- Within each returned ID, the curriculum non-destructive updates are sorted by module (Recruiting, Admissions, Learner, Outcome), term code (in descending order), key sequence number (in ascending order), and then by curriculum sequence number (in descending order).
- The SORLFOS rows are sorted by type (major first, minor second, concentration third, user-defined SORLFOS types fourth (in alpha ascending order)), priority (in ascending order), and sequence number (in descending order).

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Learner ID	No	Enter the ID or IDs for the student(s) to be processed, or enter % for all.	
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	User ID	No	Enter the user ID for the population selection. This is the ID of the user who selected the population of people. This may or may not be the same as the Creator ID. All or none of the population selection parameters must be entered.	
	Learner Module	No	Enter the student learner module code for the conversion process.	Learner Module Validation Form (STVLMOD)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term Code	No	<p>Enter the term code for which records are to be processed. You cannot enter multiple term codes.</p> <p>If this parameter is left blank, the report will use the highest SGBSTDN record for the Learner module to determine which curriculum record is current.</p> <p>This parameter retrieves records with non-destructive updates for that term. It does not retrieve non-current records from SORLCUR and SORLFOS that match the entered term code.</p>	Term Code Validation Form (STVTERM)
	Start Date	No	Enter the earliest date for which non-destructive updates should be retrieved. If this parameter is left blank, all dates are included.	
	End Date	No	Enter the latest date for which non-destructive updates should be retrieved. If this parameter is left blank, all dates are included	
	CSTS Code	No	<p>Enter the curriculum status to be used in searching for non-destructive updates. This parameter only applies to field of study rows.</p> <p>This parameter should only be used with a Report Type parameter setting of <i>F</i>. The Report Type parameter setting of <i>A</i> displays curriculum and field of study non-destructive updates. The curriculum non-destructive updates are not selected based on the value in the CSTS Code parameter.</p>	Curriculum Status Validation Form (STVCSTS)

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	CACT Code	No	Enter the curriculum activity status to be used in searching for non-destructive updates.	Curriculum Activity Status Validation Form (STVCACT)
	Report Type	Yes	Enter <i>A</i> to run the search against SORLCUR and SORLFOS, <i>L</i> to run the search against SORLCUR only, or <i>F</i> to run the search against SORLFOS only. The default is <i>A</i> .	A SORLCUR and SORLFOS L SORLCUR only F SORLFOS only

## Process Mass Entry Report (SORMEBP)

**Description** This report is used to execute the mass entry updates that have been held for job submission processing using the Results window of a mass entry form. When updates are held for batch processing, records are written to the mass entry audit table (SORMAUD and SOBMAUD) without update results. A unique system generated batch ID is generated by the mass entry form to identify the job name for later processing. This report processes the mass entry updates based on the mass entry form name, ID of the user who initiated the updates, the date and time the records were saved, the batch process ID, and whether completion dates exist. Output is listed in alphabetical order and can show summary, detail, or totals information.

This report can be run in Audit or Update Mode. When run in Audit Mode, the update results and associated result messages are not shown on the report output. When run in Update Mode, updates are made to the parent forms of the mass entry forms, and the SORMAUD table is updated with the ID of the user who ran the report, the date, the results (successful updates, failed updates, partial updates, no updates), and the setting of the **Process Indicator** on SOAMAUD.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Form Name	Yes	Enter the name of the mass entry form for which updates will be applied, or enter % for all.	SAAMAPP, SGAMSPT, SGAMSTU, SFAMREG, SHAMDEG, SHAMDIP, SHAMCAT, SHAMUDI, SHAMUCA
	Add User ID	No	Enter the Banner user ID associated with the initial mass entry audit table updates, or enter % for all.	
	Add Date From	No	Enter the date from which records were initially added to the mass entry audit tables. If left blank, the date defaults to the beginning of time.	
	Add Date To	No	Enter the date to which records were initially added to the mass entry audit tables. If left blank, the date defaults to the end of time.	
	Batch Process ID	No	Enter the system generated batch identifier from SOAMAUD for the job submission process.	

Parameters	Name	Required?	Description	Values
	Report Option	Yes	Enter <i>D</i> to show all student details, or <i>S</i> to show only control totals. The default is <i>D</i> .	D Detailed report S Totals only
	Run Mode	Yes	Enter <i>A</i> to run the report in Audit Mode or <i>U</i> to run the report in Update Mode and update the database. The default is <i>A</i> .	A Audit Mode U Update Mode

## Purge Mass Entry Audit Process (SOPMAUD)

**Description** This process is used to purge mass entry audit information that is displayed in SOAMAUD. This helps keep the SORMAUD and SOBMAUD table sizes from getting too large. Records can be selected for deletion based on mass entry form, user ID, from and to dates, and update status/delete option. The update status can be: complete updates, failed updates, incomplete updates (no completion date), not selected for updates, partial updates, or successful updates. The process can be run in Audit or Update Mode and can show summary, detail, or totals information.

Parameters	Name	Required?	Description	Values
	Form Name	Yes	Enter the name of the mass entry form for which records are to be purged, or enter % for all.	SAAMAPP, SGAMSPT, SGAMSTU, SFAMREG, SHAMDEG, SHAMDIP, SHAMCAT, SHAMUDI, SHAMUCA
	User ID	No	Enter the Banner user ID associated with the mass entry audit table updates, or enter % for all.	
	Add Date From	No	Enter the date from which records are to be purged from the mass entry audit tables. If left blank, the date defaults to the beginning of time.	
	Add Date To	No	Enter the date to which records are to be purged from the mass entry audit tables. If left blank, the date defaults to the end of time.	
	Delete Option	Yes	<p>Enter the update status for records to be purged from SORMAUD.</p> <p>Enter <i>A</i> for all updates complete (completion date exists), <i>F</i> for failed updates, <i>I</i> for incomplete updates (no completion date), <i>N</i> for not updated, <i>P</i> for partially updated, or <i>Y</i> for successfully updated. The default is <i>A</i>.</p> <p>Records with an update status of <i>A</i>, <i>F</i>, <i>N</i>, <i>P</i>, or <i>Y</i> will not be deleted unless they have completion dates. Records with an update status of <i>I</i> will be deleted without having completion dates.</p>	<p><b>A</b> Updates completed</p> <p><b>F</b> Failed updates</p> <p><b>I</b> Incomplete updates</p> <p><b>N</b> Not updated</p> <p><b>P</b> Partially updated</p> <p><b>Y</b> Successfully updated</p>

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Run Mode	Yes	Enter <i>A</i> to run the report in Audit Mode or <i>U</i> to run the report in Update Mode and update the database. The default is <i>A</i> .	A Audit Mode U Update Mode
	Report Option	Yes	Enter <i>A</i> to show form summary information from SOAMAUD, <i>D</i> to show all student details, or <i>S</i> to show only control totals. The default is <i>A</i> .  Totals include the number of persons in the mass entry selection and the number of records to be deleted.	A Summary information D Student details S Totals only
	Batch Process ID	No	Enter the system generated batch identifier for the job submission process.

## General Student Procedures

---

### Review/Change Current Student Information

The General Student Form (SGASTDN) is used to modify a student's current academic information, such as changes to major, residency, student type, etc. It is also used to enter information about a student's career, activities, comments, and veteran information. The information on the General Student Form (SGASTDN) is initially created when an applicant accepts the institution's offer of admission on the Admissions Decision Form (SAADCRV), in the batch Admissions Decision Calculation Report (SARBDSN), or when an applicant is processed on the Quick Entry Form (SAAQUIK). Information may be maintained on this form to provide a historical record of all changes.

The Miscellaneous Student Information window of SGASTDN contains optional fields which include: **Apprenticeship Code**, **Transfer Center**, **Employment and Training Code**, **Employment Expectation**, **Vocational Education Status**, **Education Level** and **Educational Goal**. The values for the **Education Level** and **Educational Goal** fields default from the Admissions Module if the information is entered there. The values for the other fields need to be entered in this window.

The **Citizenship**, which defaults from the Person Form (SPAPERS), displays in the main window. There is a **Block Code** field in the main window which supports the Block Scheduling processing. There are **Graduation Term** and **Year** fields in the main window which support the Graduation Group processing.

When attempting to delete a general student record, the system will check academic history for the effective term and will search for data greater than or equal to the Start Term and less than the End Term.

The General Student Summary Form (SGASTDQ) may be used to give a historical picture of the changes to the student's academic information over time. Information includes: student status and type, residency code, level, academic standing information, and curriculum data. The **ID** field is required, and the **Term Code** field is optional. If no term code is entered, all existing general student records will be queried for the student. If a term is entered, only those student records with a from term that is earlier than or equal to the Key Information term will be queried.

The Additional Student Information Form (SGASADD) maintains information about student cohort codes, as well as student attributes. The cohort codes will default from

admissions when the general student record is created. These codes may be used for grouping and tracking specific categories of students. The student attributes are also effective term oriented, but are maintained only in the General Student module. These attributes may be used in the student classification rules to further define the class calculation. These codes may also be used to store any additional student data.

## Concurrent Curricula Processing

Concurrent curricula processing allows an institution to record and use multiple curricula for a person who is moved through the student cycle. This functionality is used by the Recruiting, Admissions, General Student, Registration, and Academic History modules.

Please refer to “Appendix C - Concurrent Curricula Processing” for detailed information on using concurrent curricula in Banner® Student.

## Mass Entry Processing

Mass entry processing is used with Admissions, General Student, Registration, Academic History graduation, and athletic compliance processing. Mass entry forms are used to search on data, perform updates, and then display the results. Search and update criteria are user-defined and include student and curriculum elements where appropriate. The selected students can be reviewed and their updates processed immediately, or the updates can be held for later processing in job submission using a batch process. An audit form is used to view processing results for the mass entry forms.

Please refer to “Appendix D - Mass Entry Processing” for detailed information on using mass entry in Banner Student.

## Study Path Processing

Study path processing is used with the Admissions, General Student, Registration, and Academic History modules. Study paths provide a means by which a learner can associate specific course registration records to learner curriculum records during registration. The study path records allow the institution to track separate student status codes and academic standings (along with various other data) based on the student's curriculum. Likewise, a study path term enrollment record permits the tracking of enrollment eligibility that is separate from a student's overall enrollment status. The grade roll uses study paths to keep courses with an associated study path within the degree sequence created for that study path.

Please refer to “Appendix E - Study Path Processing” for detailed information on using study paths in Banner Student.

# Athletic Compliance Processing

Athletic compliance processing allows institutions to track athletic status and academic eligibility in support of the National Collegiate Athletic Association (NCAA) Athletic Compliance (ATHL) requirements.

## Processing Overview

Athletes who satisfy initial academic eligibility requirements become qualified to compete in NCAA sanctioned competition. Eligibility is based on years of eligibility, seasons of competition available, and seasons of competition used as defined by NCAA requirements. Time lapses are allowed for time periods when an athlete is not enrolled. Eligibility can be adjusted for time lapses. Transfer eligibility, academic residency, residency exceptions, and transfer status can also be considered for eligibility requirements. Additionally, institutions can effectively track changes in athlete eligibility over time. Compliance (sport) records for an athlete can be copied to future terms along with associated current competition information and, optionally, attribute information. This aids institutions in reviewing changes in eligibility. The Athletic Compliance Form (SGASPT) is used to enter and update athletic compliance information.

Institutions also have the ability to copy compliance and current athletic competition to a future term for a group of athletes using mass entry processing. This provides consistent information to the athletic certification staff as an athlete's progress is followed from term to term. The Mass Entry Athletic Compliance Form (SGAMSPT) is used to search for compliance records and then copy, insert, or update athletic information for specific athletes based on the search criteria results or a population selection. Results can be reviewed, audited, and submitted for batch update.

Please refer to “Appendix D - Mass Entry Processing” for detailed information on using mass entry processing, performing updates, and auditing results.

Institutions can track the academic progress of an athlete using the Athletic Academic Progress Form (SGAAPRG). Progress is determined by credit hours per term and academic year, to see if the athlete is in compliance and is allowed to compete in a sport. This form provides curriculum and field of study summary information, as well as degree completion information.

Institutions can query athletic compliance and competition information on the Athletic Compliance Inquiry Form (SGISPT). Athletic compliance records can be displayed in different views based on the ID, the sport, or both.

## Set Up Values Used with Athletic Compliance Processing

To use athletic compliance, set up your values on the following validation forms.

- Student Activity Code Validation Form (STVACTC)

Make sure the activity codes have the **Type** field set to *SPRTS*.

- Comment Type Code Validation Form (STVCMTT)
- Degree Completion Change Reason Validation Form (STVDCPR)
- Eligibility Code Validation Form (STVELIG)
- Originator Validation Form (STVORIG)
- Athletic Attribute Validation Form (STVSAAT)
- Athletic Academic Eligibility Validation Form (STVSAEL)
- Athletic Qualifier Status Validation Form (STVSAQS)
- Athletic Competition Reason Validation Form (STVSARE)
- Athletic Residency Exception Validation Form (STVSARX)
- Athlete Transfer Status Validation Form (STVSATR)
- Sport Status Code Validation Form (STVSPST)
- Term Code Validation Form (STVTERM)

## Enter and Update Compliance (Sport) Records

Use the Athletic Compliance Form (SGASPRT) to assign sport codes, status, athletic eligibility, academic eligibility, and athletic aid information by term to an athlete. An athlete needs at least a general person record (SPRIDEN) in order to be processed on this form. If your institution requires that an athlete with a compliance (sport) record must have an associated general student record (SGBSTDN), you can do so. A student status is displayed for the record for the term, for an ID with a general student record.

### Note

You can use the Options Menu to access SGISPRT for athletic summary queries, SGAMSPT for mass update processing, and SGAAPRG for academic progress review. ■

Compliance records can be created and modified for any term and are not required to have associated competition data. Compliance records can be modified in any term, regardless of the existence of competition data. They can also be modified if the athlete is deceased. Compliance records without competition data can be copied to a future term.

Compliance records with a history of competition can be copied to a future term using the copy functionality, but only the compliance information will be copied. Compliance records with current competition data can be copied to a future term, and the associated current competition data is also copied. If you try to copy the current competition record to a future term and the compliance record already exists, the current competition record will be copied. The compliance record will not be modified in the future term.

At a term and sport level, the associated competition data (including total number of seasons of competition available and number of seasons of competition used), athletic

attributes, and athletic comment information can be entered. Sport records, the current competition for the sport, and optionally, athletic attributes for the sport, can be copied to a future term.

At the athletic level, athletic eligibility, general comments, athletic compliance admissions information, and compliance agency transfer information can be maintained, once an athlete has been assigned to a sport/compliance record. While multiple sport records can exist for the athlete per term or terms, only a single eligibility, admission, or transfer record can exist for an athlete. Multiple general comments can be recorded for an athlete. The use of athletic eligibility, general comments, admissions, and transfer information is optional and can be deleted at any time.

In addition to the manually entered athletic compliance admissions data, admissions summary information is presented that includes any applications the athlete has submitted, curriculum and field of study information, high school attendance information, and test score data. Admissions summary information is display only. In addition to the manually entered compliance agency transfer data, transfer summary information is presented that includes transfer institutions, transfer courses, and transfer attendance period GPA data. Transfer summary information is display only.

Compliance records in a term can be deleted as long as no associated competition data (history or current), athletic attributes, or athletic comments exist for the sport. If athletic eligibility, general comments, admissions, or transfer data exists, the last (most recent) compliance record cannot be deleted. To delete the last compliance record, the athletic eligibility, general comments, admissions, and/or transfer data must be deleted, as well as any attributes and comments associated with the sport. *A compliance record can never be deleted if any associated competition data (history or current) exists.*

### Steps to Enter Compliance Records Without Competition Data

You can enter compliance (sport) records without athletic competition data, athletic attributes, or athletic comments.

1. Access the Athletic Compliance Form (SGASPRT).
2. Enter the ID for the athlete in the **ID** field in the Key Block.
3. Perform a Next Block to the Athletic Compliance Term block.
4. Enter the term for the athletic compliance record in the **Term** field.
5. Review if the person has a prospect, applicant, or general student record for the term.  
If a general student record exists, review the student status.
6. Perform a Next block to the Athletic Compliance Sport block.

7. Enter the sport code in the **Sport** field for the sport in which the athlete is participating.
8. Enter the status code for the athlete in the **Status** field.
9. Enter the eligibility code for the athlete in the **Eligible** field.
10. Set the **Athletic Aid** checkbox to checked or *Y* if the athlete is receiving athletic aid.
11. Enter the academic eligibility code for the athlete in the **Academic Eligibility** field.
12. Save the record.

You can stop here. If you wish to add additional information for the athlete, then continue with the following steps.

13. Use the Eligibility and General Comments tab to access the Eligibility and General Comments window.
14. Enter athletic eligibility term and attendance information if you choose.
15. Save your changes.
16. Use Next Block to access the General Comments block.
17. Enter general comments that are associated with the athlete.
18. Save your changes.

You can stop here. If you wish to view additional admissions information for the sport record, then continue with the following steps.

19. Use the Admissions tab to access the Admissions window.
20. Review summary data for admissions applications, curriculum and field of study records, and high school and test score information, if it is displayed.
21. Enter athletic compliance admissions information for the athlete if you choose.
22. Save your changes.

You can stop here. If you wish to view additional transfer information for the sport record, then continue with the following steps.

23. Use the Transfer tab to access the Transfer window.
24. Review summary data for transfer institutions, transfer courses, and transfer attendance period GPAs, if it is displayed.

25. Enter compliance agency transfer information for the athlete, if you choose.

26. Save your changes.

## Enter and Update Competition Records

Use the Athletic Competition block on SGASPRT to enter and maintain information related to athletic eligibility in the sport, such as the number of seasons of competition available, and to indicate if the athlete has used a season of competition for the sport in the term. A reason code for a time lapse in the athlete's availability can also be entered at any time and is required whenever the number of seasons of competition available is changed. The number of seasons of competition used and the number of seasons of competition remaining are calculated and are display only. Competition records can never be deleted. They are retained for historic reference following an athlete's participation in a sport throughout that athlete's career at the institution.

When a competition record has been saved for a sport in a term, it becomes the current competition record for the sport. Only the current competition record for a sport can be modified, regardless of the term. Once a current competition record exists for a sport, it must be copied to a future term to carry that information forward. Once the current competition data has been copied, the prior term competition record becomes history and can no longer be modified. The future term current competition record can then be modified.

Competition records for a sport in a term are displayed from most recent to least recent. When a new competition record is saved, it becomes the current competition record, and it is given a oneup sequence number. Only a single current competition record can exist, and it cannot be deleted. Previous competition records are noted as having a status of history and can be reviewed but cannot be updated or deleted. An asterisk (\*) is displayed next to the sport record in the Athletic Compliance Sport block which references the data displayed in the Athletic Competition block.

An athlete can have multiple competition records for a sport within a term but can only have one competition record that is current for the sport, regardless of the term. The sport's current competition record is designated as the most recent competition record entered for the sport in the greatest term. Only the current competition record can be updated and/or copied to a future term. The only way to carry competition data forward to a future term is to use the **Copy** button. When a current competition record is updated, a new current competition record is created, and the original competition record is preserved as history. The **Record Status** field displays the status of the competition record as *Current* or *History (Display Only)*.

When a competition record has been assigned to a sport, that competition record is associated with the sport throughout the athlete's career. Once competition data exists for a sport, the competition record and the associated compliance record cannot be deleted. Updates must occur on current competition record. Updates cannot be performed on competition records that are in history. Competition records can only be copied to a future term.

Once competition data exists for a sport in a term, that competition data cannot be entered in a prior term for the same sport. A sport can be created in a prior term, but no competition data can be entered. Once competition data has been entered for a sport, a current competition record will always exist. Institutions can establish procedures to update a sport record with associated status, attribute, or reason code information to indicate the sport is no longer active or current.

The number of seasons of competition available and the setting of the **Season of Competition Used (Indicator)** are considered for a sport across all terms when the number of seasons of competition used and the number of seasons of competition remaining are calculated. While the default number of seasons of competition available is 4, it can be changed to any value from 0-99, but a reason code is required to explain the change. No reason is required if the default of 4 is accepted. Each time the current competition record is saved, the number of seasons of competition used and the number of seasons of competition remaining will be recalculated. History competition records cannot be updated. Only current competition records can be updated.

### Steps to Enter Compliance Records With Competition Data

You can enter compliance (sport) records with associated athletic competition data, athletic attributes, and athletic comments. Once athletic competition data exists for a sport in a term, the compliance and competition records in that term cannot be deleted.

1. Access the Athletic Compliance Form (SGASPRT).
2. Enter the ID for the athlete in the **ID** field in the Key Block.
3. Perform a Next Block to the Athletic Compliance Term block.
4. Enter the term for the athletic compliance record in the **Term** field.
5. Review if the person has a prospect, applicant, or general student record for the term.  
If a general student record exists, review the student status.
6. Perform a Next block to the Athletic Compliance Sport block.
7. Enter the sport code in the **Sport** field for the sport in which the athlete is participating.
8. Enter the status code for the athlete in the **Status** field.
9. Enter the eligibility code for the athlete in the **Eligible** field.
10. Set the **Athletic Aid** checkbox to checked or *Y* if the athlete is receiving athletic aid.
11. Enter the academic eligibility code for the athlete in the **Academic Eligibility** field.

12. Save the record.
13. Use Next Block to access the Athletic Competition block.
14. Enter the beginning term of eligibility in the **Begin Term of Eligibility** field. (Optional)
15. Enter the ending term of eligibility in the **End Term of Eligibility** field. (Optional)
16. Review the default number of seasons of competition available in the **Seasons of Competition Available** field and change it if desired.
17. If you changed the number of seasons of competition available, you *must* enter a reason code in the **Reason** field.
18. Check the **Season of Competition Used** checkbox to indicate that the athlete has used a season of competition in the sport. (Optional)
19. Save the changes.
20. Review the calculated values in the **Seasons of Competition Used** and **Seasons of Competition Remaining** fields.
21. Review the status of the competition record in the **Record Status** field to see if it is current or in history.
22. Use the Attributes tab to access the Attributes block.
23. Enter attribute codes for athletic attributes for the sport record. (Optional)
24. Save the changes.
25. Use the Comments tab to access the Athletic Comments block.
26. Enter athletic comments for the sport record. (Optional)
27. Save the changes.

You can stop here. If you wish to add additional information to the sport record, then continue with the steps listed under “Entering Sport Records Without Competition Data” for entering or reviewing eligibility, general comments, admissions, and transfer information.

## Enter and Update Athletic Attributes

Use the Athletic Attributes block on SGASPRT to enter and maintain attributes for the athletic compliance sport record. An athlete can have multiple attributes for a sport within a term. Attributes are associated with the athletic compliance sport record. They are not

associated with the general student record. Attributes are unique to the sport, are associated with the term for the sport, and can be copied to a future term. An asterisk (\*) is displayed next to the sport record in the Athletic Compliance Sport block which references the data displayed in the Athletic Attributes block.

## Enter and Update Athletic Comments

Use the Athletic Comments block on SGASPRT to enter comments for the athletic compliance sport record. An athlete can have multiple comments for a sport within a term. These comments are associated with the athletic compliance sport record. If you wish to enter comments associated with the athlete, regardless of the term or sport, use the General Comments block. Athletic comments are free form, are associated with the ID, sport, and term, and are not copied to a future term. An asterisk (\*) is displayed next to the sport record in the Athletic Compliance Sport block which references the data displayed in the Athletic Comments block.

## Enter and Update Athletic Eligibility Information

Use the Athletic Eligibility block on SGASPRT to enter and maintain eligibility data for an athlete, such as attendance dates, enrollment dates, and number of attended terms. An athlete can have one athletic eligibility record regardless of sport and term.

## Enter and Update General Comments

Use the General Comments block on SGASPRT to enter and maintain general comments for an athlete. An athlete can have multiple general comments records. These records are created independently from the sport and term. The comment text is free form.

## Enter and Update Admissions Information

Use the Admissions window on SGASPRT to enter admissions compliance information and review admissions summary data for an athlete. You can view admission applications, curricula and field of study information, and high school and test score information. You can enter admissions compliance information for the athlete including qualification, SAT scores, high school core coursework, and high school GPA. An athlete can have one athletic admissions record, regardless of sport and term.

## Enter and Update Transfer Information

Use the Agency Transfer window on SGASPRT to enter compliance agency transfer information and review transfer data for an summary data athlete. You can view transfer institution, transfer course summary, and transfer attendance period GPA information. You can enter compliance agency transfer information for the athlete including quality points, transfer GPA, terms attended, hours and attempted hours, and residency information. An athlete can have one compliance agency transfer record, regardless of sport and term.

## Perform Mass Entry for Compliance (Sport) Records

Use the Mass Entry Athletic Compliance Form (SGAMSPT) to perform mass entry athletic compliance processing for athletes with compliance (sport) records. Compliance records must exist on SGASPT to be updated on this form. Updates can be made even when holds exist. You can search on specific criteria, perform copy, insert, or update processing, and then view the results. When the copy functionality is used, existing sport values will be copied by default, or you can overwrite existing values, insert a new attribute, and optionally copy the attributes from the current term to a future term. Current competition data can be copied to the future term.

If no search criteria is entered, the Results window will not display any records. If search criteria is entered that does not include the athletic compliance term, results will only be displayed for queries. A search criteria athletic compliance term code is always required to perform the copy, insert, or update process. When copy, insert, or update criteria is entered, you can manually enter IDs for students with athletic compliance records and then perform updates and process those records from the Results window.

Population selection can be also used to search for athletic compliance records and PIDs that meet the search criteria of the form. Compliance records are selected first, and then an “intersect” is performed. PIDs that exist in the population selection that meet the search criteria are selected and displayed with the results.

## Copy Compliance (Sport) Records to Future Terms

Compliance records can be copied individually on SGASPT or copied in mass on SGAMSPT. A record is always copied to a future term. Compliance data can also be inserted or updated in mass on SGAMSPT. You cannot perform the copy, insert, or updates processes at the same time.

### **Note**

Messages that are displayed on SGASPT and SGAMSPT during insert, update, and copy processing are not exactly the same, but they are similar. Messages in the Results window on SGAMSPT may provide more information than the autohint text or pop-ups that are displayed on SGASPT. ■

## Search on SGAMSPT

Before you can copy, insert, or update compliance data on SGAMSPT using mass entry processing, you need to enter the search criteria or provide a population selection. You must enter an athletic compliance term in the search criteria to use the copy, insert, or update processes. You can leave the athletic compliance term in the search criteria null when SGAMSPT is used in query mode.

The search criteria sport is not required. When the copy process is used and the search criteria sport is null, *all* sports in the search criteria with the athletic compliance term are copied to the future term. When the insert process is used and the search criteria sport is

null, the sport will only be inserted one time, but it will be inserted for any athlete with any sport in that term. When the update process is used and the search criteria sport is null, *all* sports will be updated in that term. It is suggested that a search sport be used for the copy, insert, or update processes. Only the current competition record is considered, regardless of the setting of the **Season of Competition Used in this Term** radio group (*Yes* or *No*) in the search criteria.

## Copy on SGAMSPT

The Copy window on SGAMSPT is used to copy athletic compliance and current competition information (if it exists) from the current term to a future term. The copy, insert, or update processes cannot be performed at the same time.

Compliance data is copied as follows:

- Existing compliance values are copied by default, but those values can be modified before the copy process is performed.
- The sport code, sport status, athletic eligibility, and academic eligibility values are copied to the future term.
- When status, athletic eligibility, or academic eligibility values are not entered for the copy process, existing data is used and is copied to the future term.
- When status, athletic eligibility, or academic eligibility values are entered for the copy process, those values will supersede the existing values when the copy is performed.
- Attributes are copied to the future term when requested during the copy process.
- Beginning and ending terms of eligibility and the number seasons of competition available are copied to the future term if current competition data exists for the sport.
- The reason code for the current competition record is *not* copied to the future term.
- Athletic comments are *not* copied to the future term.
- The setting of the **Athletic Aid (Indicator)** is copied to the future term as unchecked or *N*. This setting can be changed to *Yes* in the Insert or Update window for *update* processing using the **Athletic Aid** radio group.
- The setting of the **Season of Competition Used (Indicator)** is copied to the future term as unchecked or *N*, regardless of the setting on the current competition record in the current term. This setting can be changed to checked or *Yes* in the Insert or Update window for *update* processing using the **Season of Competition Used in this Term** radio group.

## Insert or Update on SGAMSPT

The Insert or Update window on SGAMSPT is used to insert or update athletic compliance data. The copy, insert, or update processes cannot be performed at the same time.

Use the Athletic Compliance Insert or Update Values section of the window to insert a new compliance record or update existing compliance values for athletic compliance records based on the search criteria entered in the Search window. You must enter an athletic compliance term in the search criteria in order to continue with an insert or update function, and then go on to process the results.

- For inserts and updates, the athletic compliance term for the search criteria is required. This prevents a different sport than the one on the current term compliance record from being copied or updated and then compromising the data and audited competition records. You can use a mass insert or update for compliance records for a selected group of athletes that are not associated with a particular sport.
- For updates, the search sport and athletic compliance term are required and cannot be changed in the Insert or Update window, once they have been entered in the Search window. To make a change, you would need to return to the Search window and re-enter a different sport or term. You also cannot change the number of seasons available or the number of seasons of competition used. This will cause those future term values to be incorrect.

Inserts and updates are performed as follows:

- The athletic compliance term in the insert or update criteria reflects the value for the athletic compliance term in the search criteria and cannot be modified.
- The value in the **Sport** field is defaulted from the search criteria for the selected term. This value cannot be changed. (The **Athletic Compliance Term** value is also defaulted from the search criteria.)
- When the **Sport** field in the search criteria is null, the **Sport** field in the update criteria will also be null. In this circumstance, *all* sports in the search criteria athletic compliance term will be updated. It is suggested that a search criteria sport be provided so that specific sport updates take place.
- When the **Sport** field in the search criteria is null, the **Insert New Sport** value will only be inserted one time. Duplicate sport records cannot exist for a term.
- The insert process does not insert competition data. Current competition data must be copied to a future term.
- The insert process does not insert the number of seasons of competition used in the term.
- When **Athletic Aid** radio group set to *No* in the search criteria, the **Athletic Aid** radio group must be set to *Yes* for the update process.
- When **Athletic Aid** radio group set to *Yes* in the search criteria, the **Athletic Aid** radio group must be set to *No* for the update process.
- When the **Season of Competition Used in this Term** radio group is set to *No* in the search criteria, the **Season of Competition Used in this Term** radio group must set to *Yes* for the update process.

- When the **Season of Competition Used in this Term** radio group is set to *Yes* in the search criteria, the **Season of Competition Used in this Term** radio group must set to *No* for the update process.

## Copy on SGASPRT

Compliance records displayed for the term in the Athletic Compliance Sport block on SGASPRT can be copied to a future term to create new compliance records in that future term. The **Copy** button is used to access the Copy Sport to Future Term window where you can specify the term to copy the compliance record to and then perform the copy. The **Process Copy** button is used to perform the copy. The **Return** button is used to return to the main window and not perform the copy. A compliance record can only be copied to a future term (the to term). The from term data is automatically populated with the current term and cannot be changed. The sport code cannot be changed. If the compliance record already exists in the specified future term, the compliance data will not be overwritten. If the compliance record does not exist in the future term, the record will be copied.

Compliance records can exist in any term, with or without competition data. When a compliance record has associated current competition data, the current competition data is copied. When competition data is copied, the from term competition record becomes the history record and cannot be modified. The to term competition record becomes the current competition record and can be modified. If current competition data exists in a future term, the copy process will not copy that competition data. Copying attributes is optional. Attributes can be copied regardless of the existence of competition data.

### Note

You can use Count Query Hits from the **Sport** field on SGAPSRT to see the current competition term for the sport when you are on a record in a prior term, or see a message that no current competition term exists for the sport. ■

Compliance data is copied as follows:

- The setting of the **Athletic Aid (Indicator)** is copied to the future term as unchecked or *N*. This setting can be changed to checked or *Y* on the new record.
- If the compliance record for the future term already exists, then the existing record will not be modified.
- If the compliance record for the future term does not already exist, a new compliance record will be created using the from term values.

Competition data is copied as follows:

- If the compliance record for the future term already exists, the current competition data is copied to the future term.
- Beginning and ending terms of eligibility and the number of seasons of competition available are copied to the future term.

- The setting of the **Season of Competition Used (Indicator)** is copied to the future term as unchecked or *N*. This setting can be changed to checked or *Y* on the new record.
- The reason code is not copied to the future term.
- Seasons of competition used and seasons of competition remaining are recalculated.
- Attribute data will be copied to the future term when the **Copy Attributes** checkbox is checked in the Copy Sport to Future Term window.

Compliance records with competition history can be copied a future term, but only the compliance data is copied. Competition data is not copied, as it is not current. Attributes are copied if selected. Current competition data can be copied to any future term. For example:

- The compliance record for golf exists in term 200111 with competition history.
- The compliance record for golf exists in term 200122 without competition data.
- The compliance record for golf exists in term 200133 with current competition data.
- The compliance record for golf exists in term 200144 without competition data.
- The compliance record for golf exists in term 200155 without competition data.

You choose to copy the compliance record for golf in term 200133 with current competition data to term 200166. The compliance and competition records are copied successfully. The results are:

- The compliance record for golf exists in term 200133 with competition history.
- The compliance record for golf exists in term 200166 with current competition data.

You can view the new compliance record in the Athletic Compliance Term and Athletic Compliance Sport blocks to see the data that was copied forward. The detail for the new record is displayed in the Athletic Compliance Sport block, and any competition information that was copied is displayed in the Athletic Competition block. When attributes are copied, that data is displayed in the Athletic Attributes block.

### **Sample Rules for Insert, Update, and Copy**

Here are some example rules for how the insert, update, and copy functionality works on SGASPRT and SGAMSPT. Compliance records can be created in any term. Remember that current competition records must be copied to future terms.

The example rules that follow use these three terms:

- Term 200111 = current or prior term
- Term 200222 = future term 1
- Term 200333 = future term 2

### ***Insert and Update Compliance (Sport) Records***

These rules refer to creating and inserting compliance records for an athlete.

- Compliance records can be created for Term 200111 when the sport does not already exist in Term 200111.
- Compliance records can be created for Term 200111 if the sport record exists in Term 200222.
- Competition records cannot be created for Term 200111 if competition data exists in Term 200222. An error is displayed that competition data cannot be created in the term.
- Competition records can be created in Term 200111 when no competition records exist for the sport in Term 200222.
- Compliance records can be created for Term 200222 when compliance records exist in Term 200111, even when competition data exists in Term 200111.

When current competition data exists in Term 200111 and compliance data (only) exists in Term 200222, competition data cannot be manually entered in Term 200222. You will need to copy the current competition data in Term 200111 to Term 200222. If you attempt to manually enter competition data in Term 200222, an error is displayed that competition data exists for this sport in a prior term, and the current competition data needs to be copied to a future term.

### ***Copy Records Individually***

These rules refer to copying compliance records on SGASPRT.

- Compliance records with no competition data in Term 200111 can be copied to any future term.
- Compliance records with current competition data in Term 200111 can be copied to Term 200222. When compliance data only exists in Term 200222, the current competition data will be copied to Term 200222.
- Compliance records cannot be copied from a future term to a previous term, such as copying from Term 200222 to Term 200111.
- Compliance records can be copied from Term 200111 to Term 200222 when no competition data exists in Term 200111, and when no compliance record exists in Term 200222.

- Compliance records with current competition data can be copied from Term 200111 to Term 200333 when current competition data exists in Term 200111 and compliance data exists in Term 200222.

### ***Insert and Update Records Through Mass Entry Processing***

These rules refer to inserting sport records using mass entry processing on SGAMSPT. For inserts and updates, the athletic compliance term for the search criteria is required. When the athletic compliance term and sport are entered in the search criteria, they will be displayed in the Insert or Update Window and cannot be changed. To make a change, you need to return to the Search window and re-enter a different sport or athletic compliance term.

- Compliance records can be updated for Term 200111 or Term 200222 at any time.
- Current competition data can be updated in Term 200111.
- Current competition data can be updated in Term 200222 when competition history exists or when no competition data exists in Term 200111.
- Current competition data can be updated in Term 200111 when compliance data exists in Term 200222.
- Only current competition data can be updated, regardless of term.

You must complete all updates to current competition data for Term 200111 before the competition record is copied to Term 200222. For example, you cannot go back to the competition history record and change the setting of the **Season of Competition Used** indicator.

### **Delete Compliance (Sport) Records**

These rules refer to deleting compliance (sport) records from SGASPRT.

- Compliance records can *only* be deleted from SGASPRT. They are *not* associated with general student records and are *not* deleted when the General Student Purge Process (SGPSTDN) is run.
- Compliance records *cannot* be deleted when athletic competition data (history or current) exists.
- Compliance records *can* be deleted when no competition data (history or current) exists for the sport, and no related data (such as athletic comments or athletic attributes) exists.
- Non-term data (such as athletic eligibility, general comments, transfer information, or admissions information) needs to be removed and the changes saved prior to the deletion of the last (most recent) sport record.
- Each compliance record *must* be deleted separately. A prompt is displayed to ensure that you wish to delete the record and save the changes.
- You *cannot* delete all sport records by deleting the term.

## Query on Athletic Competition Information

The Athletic Compliance Inquiry Form (SGISPRT) is used to query on and view athletic compliance record and athletic competition record summary information for an athlete. You can access SGISPRT using the Options Menu from SGASPRT and SGAMSPT.

You have the ability to select how the data is displayed and organized on the form. In the Key Block, you can enter either the ID for the athlete and view the associated sport records by term, *or* you can enter a sport and view the associated IDs by term for the sport. You can only enter the ID or the sport, not both.

Once you have entered the ID or the sport and used Next Block to access the Athletic Compliance Inquiry block, you can change the summary data display by selecting a different view from the **Choose View** field. The list of available views is specific to the Key Block selection of ID or sport. You can also perform subqueries on the summary data in the Athletic Compliance Inquiry block.

### Note

The current record is always the most recent sport record with competition data. ■

You can view the following types of records using the **Choose View** field.

View	Description	ID, Sport, Both
All Records	Displays all records for a sport or ID (depending on the value entered in the Key Block), with or without associated competition records.	Both
All Competition Records	Displays all competition records for a sport or ID (depending on the value entered in the Key Block), those current and those in history.	Both
Most Recent Competition Records per Term	Displays most recent history record for each term when multiple competition history records exist.	Both
Current Competition Records	Displays current competition records only: <ul style="list-style-type: none"><li>• for each sport when an ID is entered in the Key Block, and</li><li>• for each ID when a sport is entered in the Key Block.</li></ul>	Both
Sports without Competition Records	Displays sport records that do not have associated competition data.	ID

View	Description	ID, Sport, Both
Current and Most Recent Records (default for ID inquiry)	<p>Displays current sport record with competition, as well as the sport record with the highest term that does not have an associated competition record, if one exists.</p> <p>If a sport record has a competition record, and another sport record exists that has a higher term but does not have a competition record, both records will be displayed.</p> <p>If a sport record exists for a term that is less than the highest term for the competition record, it will not be displayed.</p>	ID
Athletes without Competition Records	Displays sport records for athletes, where those records do not have associated competition data.	Sport
Current and Most Recent Records per Athlete per Sport (default for sport inquiry)	<p>Displays current sport record with competition, as well as the sport record with the highest term that does not have an associated competition record, if one exists.</p> <p>If a sport record has a competition record, and another sport record exists that has a higher term but does not have a competition record, both records will be displayed.</p> <p>If a sport record exists for a term that is less than the highest term for the competition record, it will not be displayed.</p>	Sport

## Track Athletic Academic Progress

The Athletic Academic Progress Form (SGAAPRG) is used to track the academic progress of an athlete for a degree. Progress is determined by credit hours per term and academic year, to see if the athlete is in compliance and has met the academic requirements to compete in a sport. This form provides curriculum and field of study summary information. Degree completion information can be entered as well.

Records in the Academic Requirements block cannot be modified or deleted. Only the setting of the **Active (Indicator)** can be changed. If you want change a record, create a new record for the term, enter the hours, make it the active record (set the **Active** checkbox to checked or *Y*), and inactivate the existing record (set the **Active** checkbox to unchecked or *N*). This creates an audit history for the athlete.

## Banner Views Used with Athletic Compliance Processing

Two Banner views are used with athletic compliance processing.

### **Athletic Compliance Sport Records by Term and ID View (SGVATPT)**

This view is used to collect data for PIDMS for unique terms for which athletic compliance records (SGRSPRT) exist.

The following rows are in this view:

```
SGVATPT_PIDM
SGVATPT_TERM_CODE
```

### **Athletic Compliance Sport Records View (SGVISPT)**

This view is used to collect all sports data for PIDMS for which athletic compliance records (SGRSPRT) and athletic competition records (SGRATHC) exist. For example, you could perform a select of ID and full name, by term and sport code, and create a roster for that sport.

The following rows are in this view:

```
SGVISPT_PIDM
SGVISPT_ID
SGVISPT_FULL_NAME
SGVISPT_TERM_CODE
SGVISPT_ACTC_CODE
SGVISPT_SAEI_CODE
SGVISPT_ELIG_CODE
SGVISPT_SPST_CODE
SGVISPT_ATHL_AID_IND
SGVISPT_STST_CODE
SGVISPT_ASTD_CODE
SGVISPT_SEASON_USED_IND
SGVISPT_CURRENT_IND
SGVISPT_COMP_SEQ_NO
SGVISPT_COMP_USER_ID
SGVISPT_COMP_ACTIVITY_DATE
SGVISPT_SARE_CODE
SGVISPT_SEASONS_AVAILABLE
SGVISPT_ELIG_BEGIN_TERM_CODE
SGVISPT_ELIG_END_TERM_CODE
```

## Student Right to Know Reporting

The Student Right to Know act proposes regulations that require an institution of higher education to disclose information about its student body's completion or graduation rates. This act expands the types of "consumer" information that institutions are required to disclose to both current and prospective students through appropriate publications and mailings.

Institutions are required to report a completion or graduation rate for full-time certificate-seeking or degree-seeking undergraduate students. Also, institutions that award athletically related student aid are required to report completion or graduation rates of various student populations at the institution, including student athletes. If an institution cannot calculate the graduation rate of the most recent cohort of students that has had an opportunity to graduate, the institution would report a persistence rate until it can disclose an actual graduation rate of an entering cohort of students. This statute requires an institution to make these disclosures to current and prospective students by July 1, 1993, and annually thereafter.

### Note

References to the "Legislation" in this procedure, refer to the Notice of Proposed Rule Making which was published in the July 10, 1992 Federal Register. It is recommended that you read either this information, or the Dear Colleague Letter from the US Department of Education dated August 21, 1991 before this processing is implemented. ■

The following are the procedural steps which may be followed to implement the Student Right to Know reporting:

1. Update the following validation forms with your institution's defined codes:

#### *Degree Level Code Validation Form (STVDLEV)*

This form needs to be updated with numeric values, indicating a hierarchy of your institution's degree levels.

For example, an associates level degree may be assigned a numeric value of 5, a baccalaureate level degree may be assigned a numeric value of 10, and a masters level degree may be assigned a numeric value of 15. This will indicate that a baccalaureate level degree is higher than an associates level degree, and that a masters level degree is a higher degree level than a baccalaureate level degree.

#### *Cohort Code Validation Form (STVCHRT)*

An institution will define their Student Right to Know Cohort Codes on this form.

For Student Right to Know cohorts, a **Cohort Code**, **Description**, **Start Term**, **End Term**, **Degree Level**, and a checked **Print Indicator** must be designated for each code.

 **Note**

You must check the **Print Indicator** for those cohort codes which are to be included in the Student Right to Know Report (SGRKNOW). Cohort codes may be used for both Student Right to Know reporting or for tracking of other types of populations or groups. ■

When defining your institution's Student Right to Know cohorts, it is very important that the start term reflects the fall term in which the cohort of students entered the institution, and that the end term reflects the very last term in which the students could have completed or graduated from their respective programs in order to meet the regulatory requirements.

According to the legislation, a student is considered to have completed or graduated from their respective programs if they completed or graduated from the programs they entered within 150 percent of the normal time to completion or graduation.

*Example:*

If your institution offers an associates level degree, whose normal time to completion is 2 years, students enrolled in this program will be given 3 years to graduate or complete from this program in order to be considered a graduate under the Student Right to Know reporting.

If your institution offers a baccalaureate level degree, whose normal time to completion is 4 years, students enrolled in this program will be given 6 years to graduate or complete from this program in order to be considered a graduate under the Student Right to Know reporting.

According to the legislation, if an institution offers programs of different length, the institution must disclose its completion or graduation rate when 150 percent of the normal time for completion or graduation for its longest program has elapsed. If your institution offers both associate and baccalaureate level degrees, each must be defined as separate cohort codes for Student Right to Know reporting in the Banner Student System. Please note that according to the legislation, an institution must disclose an institution-wide rate. That is, the graduation rate for an entering class of associate level students and the graduation rate for the entering class of baccalaureate level students, whose start terms must match, must be combined and reported after students in both programs have been given the allowed time to graduate or complete their programs under the requirements of the Student Right to Know Act.

*Examples:*

The following is a list of the term codes and time frames that will be used in all examples within this document.

<b>Academic</b>	<b>Fall Term Code</b>	<b>Spring Term Code</b>	<b>Summer Term Code</b>
86-87	198601	198602	198603
87-88	198701	198702	198703

<b>Academic</b>	<b>Fall Term Code</b>	<b>Spring Term Code</b>	<b>Summer Term Code</b>
88-89	198801	198802	198803
89-90	198901	198902	198903
90-91	199001	199002	199003
91-92	199101	199102	199103
92-93	199201	199202	199203
93-94	199301	199302	199303
94-95	199401	199402	199403
95-96	199501	199502	199503
96-97	199601	199602	199603
97-98	199701	199702	199703

*Example 1:*

For an institution that offers a two-year associate and a four-year baccalaureate program, and does not have historical data to report, the cohort codes for the entering Fall class in 1991 might be defined as follows:

<b>Cohort Code</b>	<b>Description</b>	<b>Start Term</b>	<b>End Term</b>	<b>Degree Level</b>	<b>Prnt Incl</b>
91ASSOCIATE	Fall 1991 Associates Candidates	199101	199303	01	Y
91BACHELOR	Fall 1991 Bachelors Candidates	199101	199603	02	Y

Therefore, students entering the Associate cohort in the Fall of 1991 will be given until the end of the summer for the academic year 1993-1994 to complete their degree level program, and students entering the Bachelor cohort in the Fall of 1991 will be given until the end of the summer of the academic year 1996-1997 to complete their degree level program.

For the July 1, 1993 reporting deadline, this institution will be reporting the persistence rate of the entering class of 1991. The persistence rate is the percentage of students that completed their degree level program, moved to a higher level program, or re-enrolled in the institution in the Fall of 1992.

*Example 2:*

For an institution that offers a two-year associate and a four-year baccalaureate program, and has historical data for the entering class of 1986 to report, their cohort codes might be defined as follows:

<b>Cohort Code</b>	<b>Description</b>	<b>Start Term</b>	<b>End Term</b>	<b>Degree Level</b>	<b>Prnt Incl</b>
86ASSOCIATE	Fall 1986 Associates Candidates	198601	198803	01	Y
86BACHELOR	Fall 1986 Bachelors Candidates	198601	199103	02	Y

Therefore, students that entered the associate cohort in the Fall of 1986 were given until the end of the summer for the academic year 1988-1989 to complete their degree level program, and students entering the bachelor cohort in the Fall of 1986 will be given until the end of the summer of the academic year 1991-1992 to complete their degree level program.

For the July 1, 1993 reporting deadline, this institution will be reporting the completion/graduation rate of the entering class of 1986. That is, they will report the percentage of students that have completed their degree level program or moved to a higher degree level program prior to the specified end term as defined on the Cohort Code Validation Form (STVCHRT).

#### *Cohort Reason Code Validation Form (STVCREA)*

This validation form allows you to define reasons for inactivating a student's cohort code. For the purpose of calculating Student Right to Know graduation rates, an institution may inactivate a student's cohort code, and therefore remove the student from the cohort, if they leave the institution for one of the four following reasons:

- To serve in the Armed Services,
- To serve on Official church mission assignments,
- To serve with a foreign aid service of the Federal Government, such as the Peace Corps,
- If they have died.

Cohort reason codes should be created for each of these instances to support the Student Right to Know reporting.

#### *Banner Student Activity Code Validation Form (STVACTC)*

If your institution awards athletically related financial aid, your institution is required to report the graduation rates of certain groups of student athletes in addition to the required institution-wide graduation rate.

The sports in which the graduation rates of student athletes must be tracked are:

- Basketball
- Baseball
- Football
- Cross Country/Track
- All other sports combined

Sport codes should be created for each of these instances, as well as for other sports for which your institution awards athletically related aid, to support the Student Right to Know reporting.

 **Note**

Do not use "UNASSIGN" as an activity code. This value has already been defined as a default for use in processing for the Student Right to Know Report (SGRKNOW). ■

This functionality was not designed to satisfy the NCAA Reporting Requirements; it was designed to comply with the requirements outlined in the Student Right to Know Legislation.

2. Once all validation tables have been updated or created, you must associate students with cohort codes for an effective term on the Additional Student Information Form (SGASADD). This task may be accomplished two ways:

The first method of associating students with cohort codes is online association, which is performed on a student-by-student basis in the Additional Student Information Form (SGASADD). The keys to this form are student ID and effective term.

An alternate method of associating students with cohort codes is via the batch Cohort Load Process (SGRCHRT). This load process utilizes population selection, and should be run to update the student's general student cohort codes for the specified effective term. (Cohort codes may be loaded in batch into a person's existing recruiting, admissions, general student, or academic history record.)

A student should be placed in your institution Student Right to Know cohorts if they are full time, undergraduate, certificate-seeking, or degree-seeking students that have entered a program of higher education for the first time at your institution during the fall term. The cohort should also include students who enter an institution for the first time during the summer and then re-enroll at the same institution for the fall enrollment. However, an institution should exclude from the cohort students who enter the institution during the summer but fail to re-enroll at the same institution for the fall enrollment. For the purpose of establishing a cohort of students, an institution never includes students who transfer into the institution.

3. Once you have associated students with their respective Student Right to Know cohort code, if your institution awards athletically based financial aid, student athletes must also be associated with sport codes on the Student Sport Form (SGASPRT).

Students must be associated with a sport for which they have received athletically related financial aid, for the start term of their Student Right to Know cohort. The **Athletic Aid (Indicator)** for each sport code for which the student has received financial aid to participate in must be checked.

*Example:*

John Miller is a member of the entering cohort of baccalaureate candidates at your institution in the fall of 1991 (Term 199101). At this time, John is awarded athletic aid to play baseball. John would be assigned the baseball sport code with a checked **Athletic Aid (Indicator)** in the Student Sport Form (SGASPRT) for 199101. In the Fall of 1993, John decides he will no longer play baseball. This information may be updated and tracked for your institution's use; however, John will remain a member of

the baseball sport code and baccalaureate level cohort for Student Right to Know reporting.

The keys to the Student Sport Form are ID and Term. Once again, it is important that the student's sport code is entered with a checked **Athletic Aid (Indicator)** for the start term of their cohort to be accurately processed in the Student Right to Know Report (SGRKNOW).

#### 4. Run the Student Right to Know Report (SGRKNOW).

##### **Note**

For institutions outside of the United States, the Student Right to Know Report (SGRKNOW) uses IPEDS Ethnic Codes as defined on the IPEDS Ethnic Code Validation Form (STVETCT). These values must be entered for your institution's Ethnic Code Validation Form (STVETHN). ■

The parameters used by the report are as follows:

*Report Term* - (single, required) Defines the start term of the cohort codes to be processed and is validated against the Term Code Validation Form (STVTERM).

*Cohort Start Term* - (multiple, required) Limits the code(s) processed to those specified with a matching start term. A wildcard (%) will process all cohort codes with a matching start term and a checked **Print Indicator**. Cohort codes are validated against the Cohort Code Validation Form (STVCHRT).

*Enrollment Term* - (single, optional) Defines the term in which students must have enrollment to be counted as a persister. Term codes are validated against the Term Code Validation Form (STVTERM).

*Cohort Code* - (multiple, required) Defines the cohort codes to be processed and is validated against the Cohort Code Validation Form (STVCHRT). A wildcard (%) will process all cohort codes.

##### **Note**

Only cohorts with start terms matching the Cohort Start Term parameter selection will be processed. If a wildcard (%) is entered, only those cohorts with start terms matching the Cohort Start Term parameter or having a **Print Indicator** that is checked (set to Y) on the Cohort Code Validation Form (STVCHRT) will be processed. ■

*Sport Activity Code* - (multiple, optional) Specifies the sport activity code(s) to be processed for each cohort code and is validated against the Banner Student Activity Code Validation Form (STVACTC). Enter a wildcard (%) to process all sport activity codes.

*Degree Level* - (multiple, required) Limits cohort code(s) to be processed to match the degree level as specified on the Cohort Code Validation Form (STVCHRT), or a wildcard (%) may be entered to process all degree levels.

*Athletic Aid Indicator* - (Y/N) Enter *Y* to select only those students with the sport code(s) to be processed where the **Athletic Aid (Indicator)** for the sport code is checked.

*Print Detail Report Indicator* - (Y/N) Enter *Y* to print a detailed listing of students in each category.

*Process by Student Period* - (Y/N) Enter *Y* to process a student centric period in the report.

The following are an examples of how report parameters may be set.

*Example 1:*

For an institution that offers a two-year associate and a four-year baccalaureate program, and does not have historical data to report, the report parameters would be set as follows:

<i>Report Term:</i>	199101
<i>Enrollment Term:</i>	199201 (For the July 1, 1993 reporting, a persistence rate of the class of 1991 in the fall term of 1992 must be reported.)
<i>Cohort Code:</i>	% (Process all cohort codes with start term of 199101 and a checked <b>Print Indicator</b> .)
<i>Sport Activity Code:</i>	% (All sport activity codes will be processed.)
<i>Degree Level:</i>	% (Process cohort codes at all degree levels with a start term of 199101.)
<i>Athletic Aid Indicator</i>	Y (Select only those students with athletic aid for the sport code(s).)
<i>Print Detail Report Indicator:</i>	Y (Print a list of students placed into each category.)

*Example 2:*

For an institution that offers a two-year associate and a four-year baccalaureate program and has historical data for the entering class of 1986 to report, the report parameters would be set as follows:

<i>Report Term:</i>	198601
<i>Enrollment Term:</i>	Leave <i>null</i> (For the July 1, 1993 reporting, the actual completion/graduation rate will be determined; therefore, an enrollment term does not need to be entered.)
<i>Cohort Code:</i>	% (Process all cohort codes with a start term of 198601 and a checked <b>Print Indicator</b> .)
<i>Sport Activity Code:</i>	% (All sport activity codes will be processed.)
<i>Degree Level:</i>	% (Process cohort codes all degree levels with a start term of 198601.)
<i>Athletic Aid Indicator</i>	Y (Select only those students with Athletic Aid for the sport code(s).)
<i>Print Detail Report Indicator:</i>	Y (Print a list of students placed into each category.)

If these report parameters are entered, the output would contain:

- a summary sheet for the associates level cohort followed by a detailed listing of students within each Student Right to Know category,
- a summary sheet for each sport code that is related to the students in the associates level cohort followed by a detailed listing of students within each Student Right to Know category,
- a summary sheet for the baccalaureate level cohort followed by a detailed listing of students within each Student Right to Know category,
- a summary sheet for each sport code that is related to the students in the baccalaureate level cohort followed by a detailed listing of students within each Student Right to Know Category.

The categories\* a student may fall into for Student Right to Know reporting are as follows. They appear on the Student Right to Know Report (SGRKNOW) output.

\* These categories match those defined in the US Department of Education's National Center for Educational Statistics.

Please review the process flow after this section which shows the relationship of the categories.

*(01) Initial cohort of students* - This is the number of students with a specified general student cohort, regardless of their active/inactive status. This number represents everyone who was placed in the cohort.

(02) *Adjustment to cohort* - This is the number of students in the initial cohort that have had their general student cohort code inactivated for an effective term that falls within the time period of the start term through the end term or the report parameter enrollment term, whichever is earlier.

(03) *Adjusted cohort* - This is the number of students in the cohort whose general student cohort code is still active. This is calculated by subtracting the adjustment to the cohort from the initial cohort figure.

(07) *Total Graduates* - This is the number of students from the adjusted cohort who have a degree record on the Degrees and Other Formal Awards Form (SHADEGR) with an **Awarded Indicator** of A (on the Degree Status Code Validation Form (STVDEGS)) at the degree level of the cohort as defined on the Cohort Code Validation Form (STVCHRT). The degree must have been awarded prior to the ending date of the end term of the cohort as defined on the Cohort Code Validation Form (STVCHRT), or prior to the ending date of the user-specified enrollment term, whichever is earlier.

 **Note**

The **Graduation Date** or the **End Date** of the graduation term associated with the degree will be used in the comparison. One of these fields must be populated in order for a student to be counted as a member of the Total Graduates Category. ■

(08) *Persisters* - This is the number of students from the adjusted cohort that are not counted in the Total Graduates category but do have registration records for the specified enrollment term.

 **Note**

Students will only be placed in this category if the enrollment term is earlier than the end term of the cohort as defined on the Cohort Code Validation Form (STVCHRT). ■

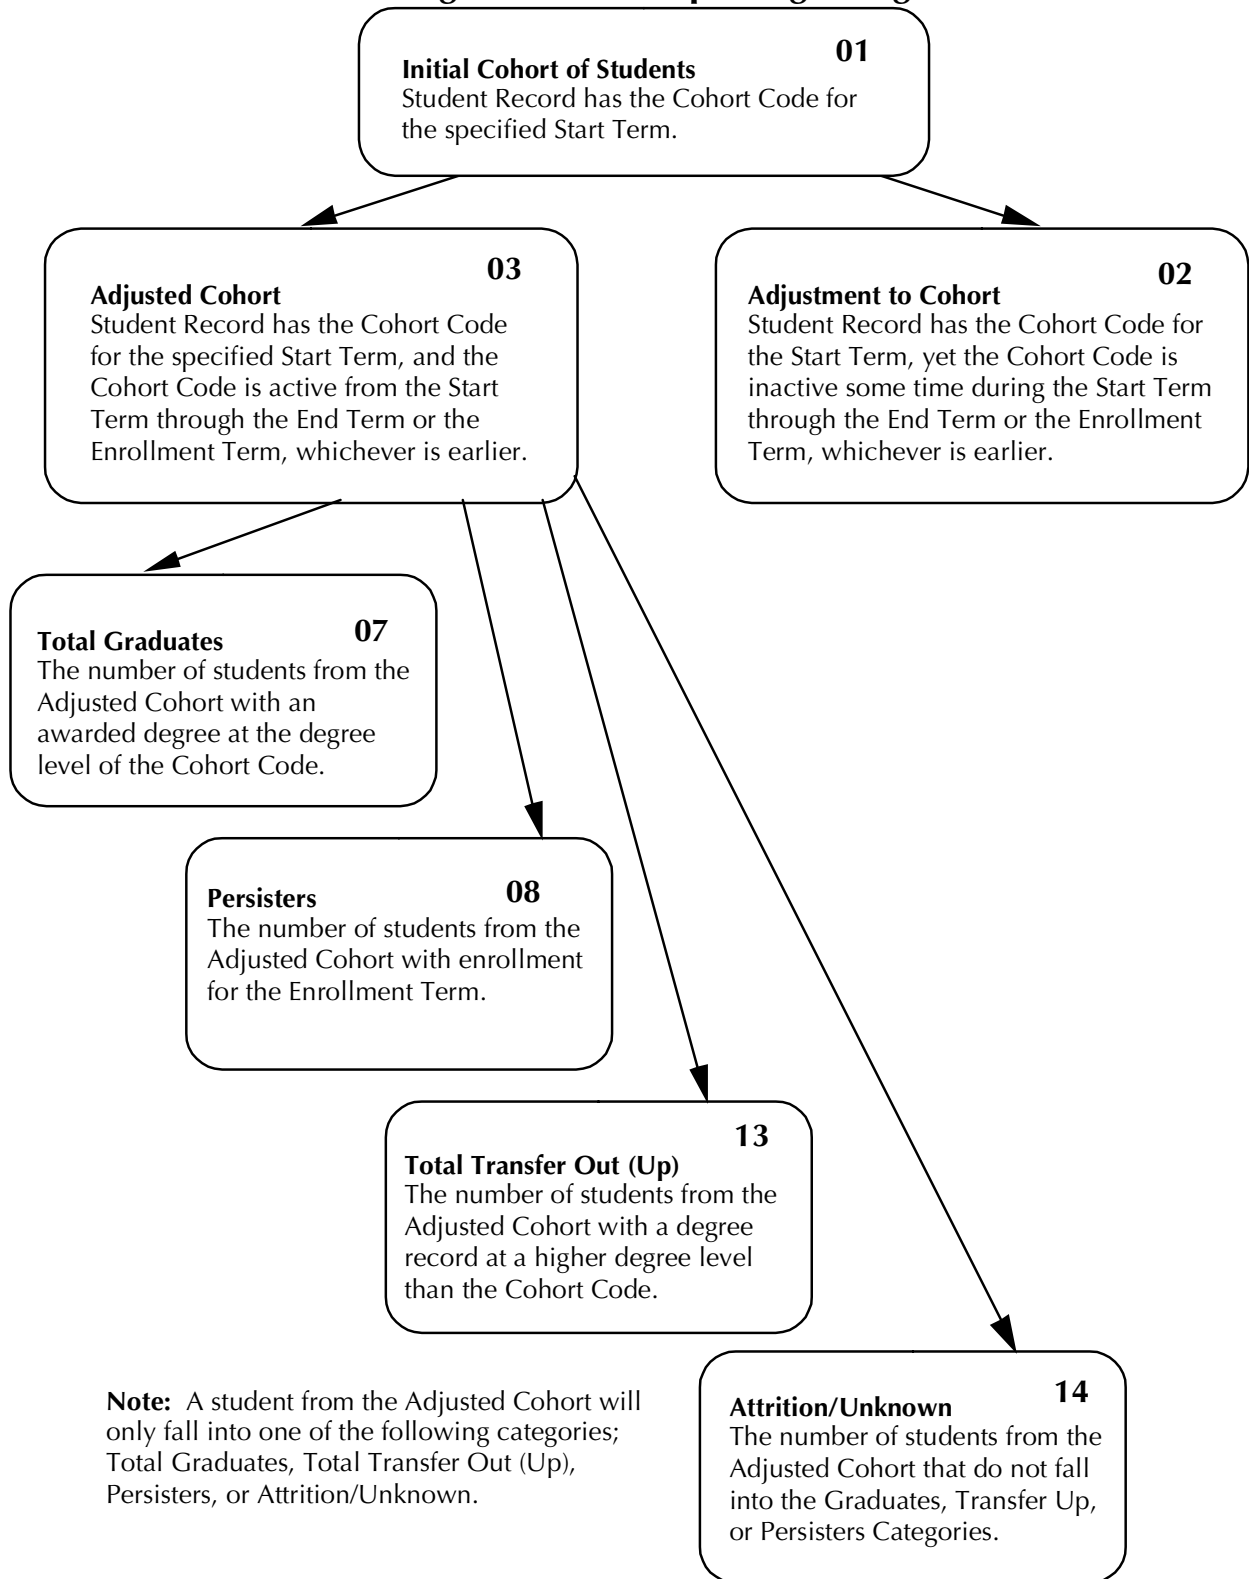

(13) *Total Transfer Out (Up)* - This is the number of students from the adjusted cohort that are not counted in the total graduates category, do not count in the persisters category, but do have a degree record on the Degrees and Other Formal Awards Form (SHADEGR) for a higher degree level program than the degree level of the cohort as specified on the Cohort Code Validation Form (STVCHRT). These students must have entered this program prior to the ending date of the end term of the cohort as defined on the Cohort Code Validation Form (STVCHRT), or prior to the ending date of the user-specified enrollment term, whichever is earlier.

 **Note**

The **Graduation Application Date** for the degree record will be used in this comparison. ■

(14) *Attrition/Unknown* - This is the number of students from the adjusted cohort that are not counted in the total graduates, total transfer out (up), or persister categories.

## Student Right to Know Reporting Categories

## Assign Cooperative Education Program

Cooperative education data for an admitted student is entered and maintained on the Cooperative Education Form (SGACOOOP).

## Assign Education Opportunity Programs and Services

The Education Opportunity Programs and Services Form (SGAEOPS) is an optional form allowing an institution to record and maintain information such as EOPS status eligibility factors, acceptance date, and student financial aid eligibility. Information is maintained on this form by effective term, as on the General Student Form. The person must be a student before EOPS information can be entered.

## Establish Student Classification

The Student Classification Rules Form (SGACLSR) is used to establish the academic classification rules to determine class calculation of freshman, sophomore, etc., based on the range of hours entered and any user-defined student attributes. A student's classification is determined by comparing his hours earned in academic history against the institution established rules. The student's attributes are maintained on the Additional Student Information Form (SGASADD).

The Student Classification Rules Form (SGACLSR) allows for the addition of attributes to be included in the rules processing. You can specify additional requirements along with the credit hour range for determining a student's classification. For example, if a student must complete a sophomore language test prior to becoming a junior, this requirement can be included in the rules. These attributes are maintained on the Student Attribute Validation Form (STVATTTS). An unlimited number of attributes may be associated with a rule. If multiple attributes are specified on a rule, then these attributes must *all* be satisfied for the student to be given the classification. Using the above example, a student who has between 60 to 89.99 earned hours, who has the attribute of SOPR - Sophomore Language Test, will be classified as a junior. A student who has 60 to 89.99 hours who does not have the attribute will remain a sophomore.

These attributes are associated with the student on the Additional Student Information Form (SGASADD). These attributes are effective term oriented and are unlimited. By each attribute being effective term oriented, it will allow the user to "time stamp" the information.

## Class Standing

Class standing uses the levels on the Student Classification Rules Form (SGACLSR). A rule must exist for the level of courses in academic history in order to determine a student's class standing. Only course levels that match the student level are used.

**Example:**

UD	0	-	999.99	UD	-	Undeclared
UG	0	-	25.99	01	-	Freshman
UG	26	-	57.99	02	-	Sophomore
UG	8	-	89.99	03	-	Junior
UG	90	-	999.99	04	-	Senior
GR	0	-	99.99	GR	-	Graduate

*Undeclared Student Level*

1 Undeclared Level Course	3 credits
1 Undergraduate Level Course	3 credits
1 Graduate Level Course	4 credits

*Class Standing Undeclared*

Class standing is calculated and displayed on the general student record, the Student Course Registration Form (SFAREGS), and the Term Course Maintenance Form (SHAINST). The standing which displays on all Banner Student forms prior to being rolled to academic history is calculated by using the institution term GPAs which are less than the term in the Key Information, or the transfer term GPAs which are less than or equal to the term in the Key Information.

## Add/Maintain Test Scores

Once a prospect has been established on the database, the various types of tests required for recruiting a prospect are entered on the Test Score Information Form (SOATEST). Test scores for SAT, ACT, GRE, GMAT, and AMCAS tests may also be loaded onto the system from test score tapes and are recorded on this form.

## Add/Maintain High School Data

The High School Information Form (SOAHSCH) is used to enter information about a person's high school career. The information includes high school, transcript dates, graduation date, GPA, and subjects taken in high school.

## Add/Maintain Prior College Data

The Prior College Form (SOAPCOL) is used to enter and maintain information about a person's prior college experience including degree information such as majors, minors, and areas of concentration, number of hours, GPA, and transcript date. A summary of the prior college information may be obtained from the Prior College Summary Form (SOAPCOQ).

## Review Student Data

The Student Report (SGRSTDN) is produced to provide, by term, an informational listing of students. Information displayed includes campus, level, student type, residency, block code, degree, major, and graduation information. It will provide historical information of changes made during a student's career. It also includes veteran information, comments, and activities.

## Review Veterans Data

The Veteran Report (SGRVETN) is used to list students with veteran information by term. It includes not only the student's veteran type and number, but also the certification hours and current schedule of classes. Schedule and veteran number data are required.

In order to produce this report, three components must exist in Banner.

- Information must be entered in the Veteran Information window of SGASTDN for the **Veteran Type**, **Term**, **Certification Credit Hours**, and **Certification Date** fields. Valid values for the veteran type code come from STVVETC. The term code is the term of veteran certification. The veteran certification credit hours for the term are entered in format 99.99. The veteran certification date is entered in format MON-DD-YYYY.
- The veteran file number must exist on the General Person Form (SPAPERS) in the **Veteran File Number** field.
- The student must be registered for courses on the Student Course Registration Form (SFAREGS).

Also, the term code entered in the Veteran Information window of SGASTDN and on SFAREGS must match the term code entered in the Term parameter for the report.

# Cooperative Education (Co-op) Tracking

## Overview

Co-op tracking allows institutions to track dates, purposes, and sponsorships for activities related to courses or other educational tasks that need to be linked to enrollments or recorded in academic history.

You can create multiple co-op records, attach them to CRNs (sections), and roll them to academic history. When you have attached a co-op to a course section, you can track the activity's sponsor for tasks such as residencies, internships, and clerkships and check potential schedule conflicts and data overlaps.

### Note

You may have multiple co-ops for a student for a term, but the CRN assigned to each co-op must be unique. ■

## Tracking Co-ops

### Validation Form Set-up

Use the Cooperative Education Code Validation Form (STVCOPC) to create cooperative education codes.

Check the **Co-op Assignment Allowed** checkbox on the Schedule Type Code Validation Form (STVSCHD) to indicate that the schedule type for the section is allowed to be assigned to a co-op on SGACOOB.

### Using SGACOOB for Co-ops

Use the Cooperative Education Form (SGACOOB) to enter or validate CRNs that are associated with co-ops.

The **CRN** field on SGACOOB allows the entry of a CRN associated with a co-op. This field also validates entries so that only sections which exist and that allow co-op attachment (based on the schedule type) can be assigned as a co-op activity. Also, the CRN must exist for the person in registration for the term or in academic history for the term.

You may navigate to three other forms from the **CRN** field. Use function keys or the Option List to access the information. You may query sections, registration, or history.

- Use a List function or select Schedule Section Query from the Option List to access the Schedule Section Query Form (SSASECQ).

The Schedule Section Query Form (SSASEGQ) will display from SGACOOOP if a schedule exists for the effective term in the Key.

If you enter a term in the Key for which no sections exist on SSASECQ, you will see the following error, *\*ERROR\* No Schedule for the selected term.*

- Use a Count Query Hits function or select Registration Query from the Option List to access the Registration Query Form (SFAREGQ).

The Registration Query Form (SFAREGQ) will display from SGACOOOP if a valid CRN exists for the ID number, effective term, and level, so you may query the student's schedule. This allows you to view active registration information for the term so you can select the CRN to be associated with the co-op.

If you enter an ID for a student who has no registration information on SFAREGQ for the term in the Key, you will see the following error, *\*ERROR\* No registration exists for the selected term.*

- Use a Duplicate Item function or select Course Summary from the Option List to access the Course Summary Form (SHACRSE).

The Course Summary Form (SHACRSE) will display from SGACOOOP if a valid CRN exists for the ID number, effective term, and level, so you may query the student's courses for the term. This allows you to view courses in history for the term so you can select the CRN to be associated with the co-op.

If you enter an ID for a student who has no academic history information on SHACRSE for the term in the Key, you will see the following error, *\*ERROR\* No Academic History for selected term.*

The following situations will cause errors to be displayed in the autohelp on SGACOOOP:

- If you enter a CRN that is not valid for the term, you will receive the message *\*ERROR\* CRN does not exist* and will not be able to advance into the form. If you have already removed the information for the student using the Cooperative Education Purge (SGPCOOOP), you should delete the co-op record, or you will receive this error.
- If you enter a CRN where the schedule type is not checked as a co-op assignment on STVSCHD (does not allow assignment to a co-op activity), you will receive the message *\*ERROR\* Schedule type does not allow co-op* and will not be able to advance into the form.
- If the co-op record exists, and the student's information has been changed in registration or academic history, (i.e., the student is dropped from a course, the CRN is no longer valid as it is counted in enrollment on STVRSTS), you will receive the message *\*WARNING\* CRN is no longer valid for the term and level.* However, you will be able to advance in the form. The CRN must represent a section for which the student has registered or has in history for the term and level

of the co-op activity. If you run purges for registration and scheduling, but the student has already been rolled to history, the error will not occur.

The **Course Title** field (untitled) on SGACOOOP displays the title of the course entered in the **CRN** field. This title will come from the schedule, if the CRN is assigned to the co-op and the enrollment is in registration, or it will come from history, if the CRN is assigned to the co-op and the enrollment has already been rolled to history.

The **Begin Date** and **End Date** fields on SGACOOOP are optional fields used to check for overlapping dates on the co-op records for the term, regardless of level or schedule type. When a conflict exists, an alert box will display with the message *\*WARNING\* Activities overlap in term, check to override*. Check the **Override** box and then save the record to continue to add data for the co-op. This data overlap checking will take place whenever a new activity is added or when the start or end dates are changed.

The **Evaluation Prepared** and **Evaluation Received** date fields on SGACOOOP are optional fields which may be used to track when a student's evaluation was prepared and sent to the co-op provider and then received from and recorded by the co-op provider.

The **Employer Code** field on SGACOOOP is optional, so you are not required to enter employer or provider information for a co-op, if the co-op is being used to designate a vacation or other activity not associated with an employer.

Use the Cooperative Education Activities option in the Navigation Frame on SGACOOOP to access the Cooperative Education Activities for Term window. This window is used to display the co-ops available for the student for the effective term and to see what conflicts exist or have been previously overridden. Use the **Return** button to return to the main window.

### Using SFAREGQ for Co-ops

Use the **Co-op Education** button on the Registration Query Form (SFAREGQ) to navigate to SGACOOOP when the cursor is on a CRN which allows co-op assignment (the schedule type for the section is flagged on STVSCHD to allow co-op). Button activation is determined by the CRN your cursor is on.

The button has three modes:

- *Data* - A valid co-op is assigned for that student, term, and CRN. The button is enabled, and the message bubble says Data.
- *No Data* - A valid co-op record exists for the CRN. The button is enabled, and the message bubble says No Data.
- *Disabled* - There is no co-op record attached to the CRN. The button is not enabled.

## Using SHATCKN for Co-ops

Use the **Co-op Education** button on the Course Maintenance Form (SHATCKN) to access SGACoop and view the co-op associated with the CRN in academic history for the student. Button activation is determined by the CRN your cursor is on.

## Using the Grade Roll Process for Co-ops

When information is rolled to academic history either online using the Class Roster Form (SFASLST) or the Class Attendance Roster Form (SFAALST) or in batch using the Grade Roll to Academic History (SHRROLL), the section start and end dates are rolled. If the schedule type of the section permits assignment of a CRN to a co-op activity, and the CRN is assigned to a co-op for the term, the start and end dates for the co-op are rolled. If no co-op exists or the section's type does not permit the assignment of a CRN to a co-op activity, then the section dates are rolled.

The shared package SHKROLS is used to perform all grade roll functionality. It works in conjunction with the Grade Roll to Academic History (SHRROLL) batch program and the online roll process performed on the Class Roster Form (SFASLST) and the Class Attendance Roster Form (SFAALST).

## Automatic PIN Creation

PINS can be added to Banner manually for an individual, by batch process using a population selection, or automatically by database trigger.

You have the option to automatically create PINs when a general student record or faculty record is inserted. Triggers on the SGBSTDN and SIBINST tables will create PINs when a student or faculty record is inserted into either table, if the triggers are set up to do so. This automatic creation allows the PIN to be available for use as soon as the person becomes eligible to access the self-service processing. The triggers will fire when the record is inserted, based upon the institution's PIN preferences and table selections on the PIN Preference Form (GUAPPRF).

Please note that performance issues may arise when the PIN triggers are used. You may need to turn this functionality off if batch processing is involved. Student and faculty records are generally processed individually and should not be affected. However, if you assign decisions which create student records using the Admit Decision Calc Report (SARBDSN), you may want to disable automatic PIN creation during batch decision runs.

Please refer to the *Banner General User Guide* for more information on PIN functionality and the PIN Preference Form (GUAPPRF).

## Purge Processes

The following purge processes are part of the General Student module.

### sgpstdn.pc - General Student Purge

This process purges the general student information for a student who never registered based on the user-specified effective term and activity date. You can choose to leave the High School, Prior College, Guardian, Test Score, and Hold information on the database also by parameter selection. General Student information will not be purged if:

1. The student has any active holds.
2. The student has academic history information, i.e., a term course maintenance record exists in the SHRTRM table.

However, if the general student record is purged, the associated communication plan record, along with the person's contacts and outside interests will also be purged.

### sgpcoop.pc - Cooperative Education Purge

This process will purge all the cooperative education information based on the user specified parameters of term and activity date.

### sgphold.pc - Hold Purge

This process purges all expired holds based on the user specified parameters of expiration date, activity date, and hold type. You can choose one of two options:

- Option 1: Hold expiration date (date must exist to be purged)
- Option 2: Hold activity date

## General Student Reports

---

This section contains a sample of each report in the General Student module. Parameter listings are also provided for your convenience.

The following reports are run through the General Student module:

Student Report	(SGRSTDN)
Veteran Report	(SGRVETN)
Hold Purge	(SGPHOLD)
General Student Purge	(SGPSTDN)

Cooperative Education Purge	(SGPCOOP)
Student Block Load Process	(SGPBLCK)
Cohort Load Process	(SGRCHRT)
Student Right to Know Report	(SGRKNOW)

## Creating a Population Selection

To perform population selection, the application you will be working with must first be defined on the Application Definition Rules Form (GLRAPPL).

The second step is to enter the Population Selection Definition Rules Form (GLRSLCT), enter the **Application (Code)**, and create a **Selection ID (Identifier)** with a description.

In the Selection Definition section, define the **Select** and **From** portions of the SQL statement that the selection represents.

### *Example:*

```
Select:      SARADAP_PIDM
From:        SARADAP
```

Next, enter the Selection Rules for the population of records you would like to see.

### *Example:*

```
SARADAP_TERM_CODE_ENTRY    =    '200010'        AND
SARADAP_LEVL_CODE          =    'UG'
```

Save your data and exit. Your population selection rules will be compiled. If any errors are issued during the compilation process, resolve the errors before continuing. If you do not resolve all errors given during the compile process, you will not be able to use the population selection rules to extract a population.

You are now ready to extract the population of people. The Population Selection Extract (GLBDATA) is run from the Process Submission Control Form (GJAPCTL). At minimum, you will need to supply the parameters for Selection Identifier 1, Application, and Creator ID, which are the values that were in the Key Information of the Population Selection Definition Rules Form (GLRSLCT).

After extracting the population, you can use the Population Selection Extract Data Form (GLAEXTR) to view and/or modify the people in the population. You can add or delete people from the population using this form. The keys to the form are **Application**, **Selection ID**, and **Creator ID**. (**User ID** is also displayed in the Key Information.) You will be able to add or delete people only from populations that you selected.

After extracting the population, and modifying the people in it if necessary, you can use the population for a variety of purposes. Letters can be produced using Letter Generation, based upon a population, and many Banner reports and processes also can accept a population for processing.

For additional details on population selection, refer to the *Banner General User Guide*.

## Student Report (SGRSTDN)

**Description** This report is used to list student information by term in name or ID order for a selected population.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term - Optional	No	Enter the term code representing the term for which you wish to list the student information.	Term Code Validation Form (STVTERM)
	Report Sequence (N=Name, I=ID)	No	Enter <i>I</i> to print in ID number order; enter <i>N</i> to print in name order.	I ID number order N Name order
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.

## Veteran Report (SGRVETN)

**Description** This report is used to list students with veteran information by term. It includes not only the student's veteran type and number, but also the certification hours and current schedule of classes. Schedule and veteran number data are required.

In order to produce this report, three components must exist in Banner.

- Information must be entered in the Veteran Information window of SGASTDN for the **Veteran Type**, **Term**, **Certification Credit Hours**, and **Certification Date** fields. Valid values for the veteran type code come from STVVETC. The term code is the term of veteran certification. The veteran certification credit hours for the term are entered in format 99.99. The veteran certification date is entered in format MON-DD-YYYY.
- The veteran file number must exist on the General Person Form (SPAPERS) in the **Veteran File Number** field.
- The student must be registered for courses on the Student Course Registration Form (SFAREGS).

The term code entered in the Veteran Information window of SGASTDN and on SFAREGS must match the term code entered in the Term parameter for the report.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Term	Yes	Enter the term code representing the term for which you wish to list the students' veteran information.	Term Code Validation Form (STVTERM)

## Hold Purge (SGPHOLD)

**Description** This process will purge all expired holds based on the user-specified parameters of expiration date, activity date, and hold type. You can purge holds by expiration date (date must exist to be purged) or by hold activity date.

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code associated with the process.	Term Code Validation Form (STVTERM)
	Purge Option	Yes	Choose a purge option. Enter <i>1</i> to purge holds by expiration date, or enter <i>2</i> to purge holds by hold activity date.	1 Purge records by expiration date 2 Purge records by activity date
	Hold Expiration Date	Yes	Holds with end date less than or equal to the date entered will be purged. Enter in date format DD-MON-YYYY.  This parameter is required if purge option 1, hold expiration date, is chosen.	
	Hold Activity Date	No	Holds with activity dates that match the date entered will be purged. Enter in date format DD-MON-YYYY.	
	Exclude Hold Type	No	Hold types specified will be excluded from the purge process. Multiple requests are permitted.	Hold Type Code Validation Form (STVHLDD)
	Run Mode	Yes	Enter <i>A</i> to produce a listing of all selected purge data without affecting the database. Enter <i>U</i> to update the database after purging the selected data.	A Audit U Update

## General Student Purge (SGPSTDN)

This process purges general student records for students who have never registered for courses based on the user-specified parameters listed below. You can purge general student records by term for those students who are not registered, or you can purge records by term and date. You can retain high school, prior college, guardian, test score, and hold information in the database if you choose.

General student information will not be purged when the following conditions exist.

- The student has active holds.
- The student has academic history information, such as the existence of a term course maintenance record in the SHRTTRM table.

However, when the general student record is purged, the associated communication plan record, along with the person's contacts and outside interests, will also be purged.

The process checks if the SGBSTDN record is the last record for the PIDM and has a curriculum record with an associated graduation application that has not been rolled. In this case, the record will not be deleted. If the SGBSTDN record is not the last record for the PIDM, it still cannot be deleted if it has a current curriculum record with a graduation application that has not been rolled.

### Note

Child records of general student records are deleted when the purge is run. Sport information is *not* a child record of the general student record. Therefore, sport records are not deleted when general student records are deleted. Sport records can only be deleted from SGASPRT. ■

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code for which records are to be purged.	Term Code Validation Form (STVTERM)
	Purge Option	Yes	Choose a purge option. Enter 1 to purge general student records for those students who are not registered by term, or enter 2 to purge general student records by term and date.	1 Purge records without term registration 2 Purge records by term and date

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Effective Term	No	General student records without registration whose effective terms are less than or equal to the effective term entered will be purged.	Term Code Validation Form (STVTERM)
	Activity Date	No	General student records with activity dates that match the date entered will be purged. Enter in date format DD-MON-YYYY.	
	Purge High School Information	No	Enter <i>Y</i> to purge the general student record but retain the high school information for a student or <i>N</i> to avoid purging the general student record.	Y Purge but retain high school N Do not purge
	Purge Prior College Information	No	Enter <i>Y</i> to purge the general student record but retain the prior college information for a student or <i>N</i> to avoid purging the general student record.	Y Purge but retain prior college N Do not purge
	Purge Guardian Information	No	Enter <i>Y</i> to purge the general student record but retain the guardian information for a student or <i>N</i> to avoid purging the general student record.	Y Purge but retain guardian information N Do not purge
	Purge Test Score Information	No	Enter <i>Y</i> to purge the general student record but retain the test score information for a student or <i>N</i> to avoid purging the general student record.	Y Purge but retain test scores N Do not purge
	Purge Hold Information	No	Enter <i>Y</i> to purge the general student record but retain the hold information for a student or <i>N</i> to avoid purging the general student record.	Y Purge but retain holds N Do not purge
	Run Mode	Yes	Enter <i>A</i> to produce a listing of all selected purge data without affecting the database. Enter <i>U</i> to update the database after purging the selected data.	A Audit U Update

## Cooperative Education Purge (SGPCOOP)

**Description** This process is used to purge all the cooperative education data for all students.

Parameters	Name	Required?	Description	Values
	Process Term	Yes	Enter the term code representing the term for which you wish to delete all the cooperative education data.	Term Code Validation Form (STVTERM)
	Process Option	Yes	Enter <i>1</i> to purge all records with effective term less than or equal to the specified term; enter <i>2</i> to purge all records with an activity date less than or equal to the specified date.	1 Purge records with effective term less than or equal to specified term 2 Purge records with activity date less than or equal to specified date
	Effective Term	No	Enter the term code representing the term prior to which you wish to delete all the cooperative education data.	Term Code Validation Form (STVTERM)
	Activity Date	No	Enter the date prior to which you wish to purge all the information (use date format DD-MON-YYYY).	
	Run Mode	Yes	Enter <i>A</i> to run the report without updating the database (audit mode); enter <i>U</i> to update the database after running the purge process (update mode).	A Audit U Update

## Student Block Load Process (SGPBLCK)

**Description** This process associates a group of students defined through population selection to a block code for an effective term. The block code on the General Student Form (SGASTDN) is *not* updated when the process is run in update mode.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	Report Term	Yes	Enter the code representing the term for which the report is to be run. This is the term that will be used in headers and student selection.	Term Code Validation Form (STVTERM)
	Effective Term	Yes	Enter the effective term of the general student record to be updated with a block code.	Term Code Validation Form (STVTERM)
	Block Schedule Code	Yes	Enter the block schedule code to be posted to the selected student records.	Block Code Validation Form (STVBLCK)

NUMBER OF PERSONS SELECTED FOR PROCESSING: 5

## Cohort Load Process (SGRCHRT)

**Description** This process is used to assign cohort codes to a group of persons selected via population selection and permits you to assign the population cohort codes in the person's recruiting, admissions, general student, and academic history records for an effective term. Please note that these records must exist in order to have cohort codes added; the process will not create records if one does not exist. This process accepts an input file from the population selection process to create cohort information. Please refer to the *Banner General User Guide* to review the method used to create a population selection.

Parameters	Name	Required?	Description	Values
	Selection Identifier	No	Enter the code that identifies the population with which you wish to work. The selection identifier must be defined on the Population Selection Definition Rules Form (GLRSLCT). All or none of the population selection parameters must be entered.	Population Selection Inquiry Form (GLISLCT)
	Application Code	No	Enter the code that identifies the general area for which the selection identifier was defined. All or none of the population selection parameters must be entered.  The Population Selection Extract Inquiry Form (GLIEXTR) may be used to review the people who will be processed in the load from the selection identifier and application code entered.	Application Inquiry Form (GLIAPPL)
	Creator ID	No	Enter the user ID of the person who created the population rules. All or none of the population selection parameters must be entered.	
	Report Term	Yes	Enter the code representing the term for which the report is to be run.	Term Code Validation Form (STVTERM)
	Effective Term	Yes	Enter the term code representing the effective term for which the cohort code is to be loaded.	Term Code Validation Form (STVTERM)

Parameters	Name	Required?	Description	Values
	Cohort Code	Yes	Enter the cohort code for which the population is being loaded. All persons in the file will be loaded with this cohort code, if one exists. Multiple cohort codes may be entered.	Cohort Code Validation Form (STVCHRT)
	Module	Yes	Enter the module information to which the cohort codes are to be loaded. Valid values are <i>R</i> - Recruiting, <i>A</i> - Admissions, <i>G</i> - General Student, and <i>H</i> - Academic History.  Please note that the persons selected via population selection must have an existing record in the module selected in order to be loaded. The process will not create a record for a person if one does not already exist.	R Recruiting A Admissions G General Student H Academic History

## Student Right to Know Report (SGRKNOW)

**Description** This process is used to produce data that will assist your institution in calculating graduation and completion rates by cohort and optionally by sport codes. If sport reporting is utilized, those students who receive athletically based financial aid may be specifically selected to be processed by sport. This report also processes information based on terms that are part of a student centric period.

This report will print a summary page for each cohort processed, and if sport reporting is utilized, the report will produce a summary page per cohort, as well as a summary page for each cohort and sport combination specified via parameter selection.

If the Print Detail Report Indicator parameter is set to *Y*, in addition to each summary page, a detailed list of those students in each category will also be produced.

The print order of the report output is as follows: summary of cohort, detail breakdown of the cohort, summary of cohort/sport combination, detail of cohort/sport combination, and so on until all combinations of cohort and sport are selected, summarized, and detailed.

If no students fall into a category on the summary page (the category has all zeros on the summary page), this category will not print on the detail page. All categories print on the summary page.

<i>Parameters</i>	<b>Name</b>	<b>Required?</b>	<b>Description</b>	<b>Values</b>
	Report Term	Yes	Enter the report term for heading of the report.	Term Code Validation Form (STVTERM)
	Cohort Start Term	Yes	Enter the start term for the cohorts to be processed. Only cohorts with this start term will be processed.	Term Code Validation Form (STVTERM)
	Enrollment Term	No	Enter the enrollment term if a persistence rate is to be calculated for the cohort. Students must be enrolled in the term to be counted as persisters. If no enrollment term is entered, no students will ever fall into the persisters category.	Term Code Validation Form (STVTERM)

Parameters	Name	Required?	Description	Values
	Cohort Code	Yes	<p>Enter the cohort code for the cohorts to be processed. Multiple values may be entered. Enter % to select all report inclusion cohort codes for processing.</p> <p><b>Note:</b> Only cohorts with start terms matching the Cohort Start Term parameter selection will be processed. If a wildcard (%) is entered, only those cohorts with start terms matching the Cohort Start Term parameter or having a <b>Print Indicator</b> that is checked (set to Y) on the Cohort Code Validation Form (STVCHRT) will be processed.</p>	Cohort Code Validation Form (STVCHRT)
	Sport Activity Code	No	Enter the sport activity code(s) to be processed for each cohort code. Enter % to select all possible sport activity codes for processing. Multiple values may be entered.	Banner Student Activity Code Validation Form (STVACTC)
	Degree Level	Yes	Enter the degree level code for the cohorts to be processed. Enter % to select all possible degree levels for processing. Multiple values may be entered. This parameter will allow the user to specify the cohorts to be processed by degree level.	Degree Level Code Validation Form (STVDLEV)
	Athletic Aid Indicator	No	<p>Enter Y to limit sport reporting to those athletes within the cohort and sport code who have received athletic aid.</p> <p>Enter N or leave blank if reporting all athletes. This indicator works in conjunction with the sport code and athletic aid indicator setting associated with the athlete.</p>	<p>Y Athletic Aid</p> <p>N All athletes (also NULL)</p>

Parameters	Name	Required?	Description	Values
	Print Detail Report Indicator	No	Enter <i>Y</i> to produce a detailed breakdown of student information in each category. Enter <i>N</i> or leave blank to suppress the detail pages. A summary page will always print for a cohort with students belonging to it.	Y Detailed student information by category N Suppress detail pages (also NULL)
	Process by Student Period	Yes	Enter <i>Y</i> to process a student centric period for right to know reporting or <i>N</i> to not process a student centric period. The default is <i>N</i> .	Y Process student centric period N Do not process student centric period
